History, Use, Propagation, Culture,

1012 *Ledum* Λήδον was the name applied by the ancients to the plant producing the substance called Ladanum, and now known by the name of Cistus Ledum In foliage the Ledum of modern botanists agrees with the plant of the ancients Pretty American plants, very commonly cultivated for the beauty of their flowers

1013 *Rhodora* A name of the same meaning as Rhododendron It is well known in shrubberies as remarkable for its purple flowers appearing on the naked shoots before the leaves come out

1014 *Rhododendron* From ῥόδον, a rose, and δενδρεον, a tree, because the flowers resemble in color bunches of roses. Some of the species form beautiful and even splendid ornaments to the shrubbery or American ground, and all of them are interesting and deserving of culture

R ferrugineum and hirsutum abound on the high mountains of Switzerland, Austria, Savoy, Piedmont, Dauphiné, and terminate ligneous vegetation as we ascend, and furnish the shepherds with their only fuel The grouse are said to eat them, and the white hares sometimes gnaw the bark in hard weather, but animals do not seem to feed on them, except from want of other food, and they are suspected of being in a small degree poisonous The galls of some small insect are frequent on them

R. dauricum is almost peculiar to the subalpine tracts of eastern Asia, it appears first at the mouth of the river Jenisea, and beyond that, especially from the river Uda, in the pine woods, it begins to be common; but about Baikal it is most abundant, and extends through the deserts of the Mongols to China and Tibet at the Lena it becomes more rare, and beyond that it is much lower, with a more slender flower and narrower leaves. (*Pallas*)

R. Camtschaticum is an elegant evergreen under shrub, it grows abundantly in the peninsula of Kamtchatka and Behring's island in muddy places on the mountains

R. caucasicum is a native of the higher rocks of Caucasus, near the perpetual ice, in the highest range of shrubby vegetation, with Myrtillus and Vitis idæa

R chrysanthum is a beautiful evergreen, resembling R dauricum, and like it is a native of the alpine regions of Siberia, where it is a noted remedy for rheumatism It is cultivated in this country with the

5919 Leaves linear revolute at edge beneath downy

5920 Leaves oblong revolute at edge beneath downy, Flowers about pentandrous
5921 Leaves ovate oblong flat smooth

5922 The only species

5923 Leaves smooth leprous beneath, Corolla funnel-shaped
5924 Leaves elliptical acute ciliated dotted beneath, Corolla funnel-shaped
5925 Leaves smooth dotted naked, Corolla rotate

5926 Leaves ciliate nerved, Corollas rotate, Calyxes leafy
5927 Leaves elliptical acute glandular ciliated naked, Cor rotate, Petals obtuse

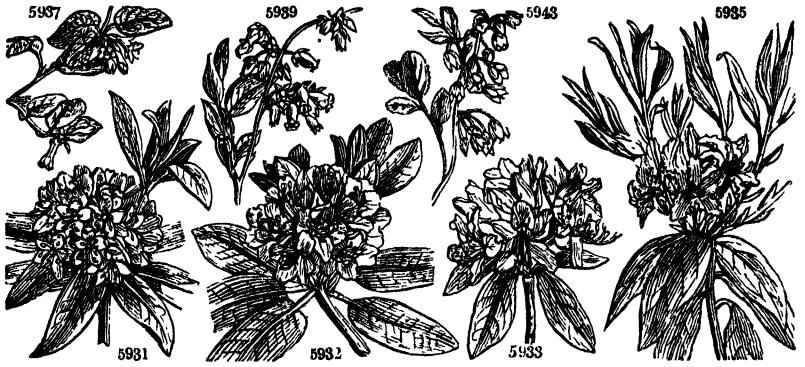
5929 Leaves oblong scabrous beneath discolored smooth, Umbels terminal, Cor rotate, Pet. obovate irregular
5930 Leaves oblong smooth beneath dotted with resin, Umbels terminal, Cor funnel-formed



5931 Leaves oblong glabrous discolored beneath, Umb. terminal, Cor rotate, Petals roundish
β Leaves cuneate-lanceolate flat
γ Leaves larger oblong-elliptical flattish
5932 Leaves short oval rounded at each end smooth discolored beneath, Sepals elong obl Cor campanulate
5933 Leaves oblong smooth · of the same color on both sides, Corymbs terminal, Cor. campan rotate

5934 Leaves lanceolate acute silvery beneath, Flowers clustered campanulate, Calyxes woolly
5935 Leaves thin rugose lanceolate smooth subdeciduous
5936 Leaves oval coriaceous glaucous beneath

5937 Leaves cordate ovate entire, Cor cylindrical

5938 Leaves imbricated subulate smooth, Pedunc solitary terminal, Cor globose-campanulate
5939 Pedunc. aggregate on the branches, Cor ovate cylindrical, Leaves oblong-ovate entire deciduous

5940 Pedunc aggregate axillary, Cor globose, Leaves ellipt entire beneath mealy scaly
5941 Arborescent, Lvs coriaceous cuneate-lanc acute entire with downy scales beneath, Fl.-stalks scurfy rusty
5942 Pedunc aggregate, Cor ovate transparent, Lvs altern. broad lanc obtuse entire cinereous beneath
5943 Pedunc. aggregate, Cor globose campanulate, Leaves oval subserrate shining

and Miscellaneous Particulars.

greatest difficulty. The leaves have an austere, astringent, bitterish taste, and are stimulant, narcotic, and diaphoretic When taken, they first increase the arterial action and the heat of the body, producing diaphoresis, and these effects, according to Dr Home's observations, are followed by a proportional diminution of excitement, the pulse in one case having been reduced thirty-eight beats. It has not been much used in this country (*Thomson's London Dispensatory*, 477)

R. maximum grows on rocks and in barren soils, where it continues flowering great part of the year, and is very ornamental.

R ponticum grows in wet places in beech and alder coppices, on rocky mountains, but not on high alps.

Rhododendrons are commonly propagated by layers, but some sorts produce seeds, and seeds of others are obtained from America. The seeds "should be sown early in spring, in flat pans or pots of peat soil, and very thinly covered they may then be set in a close frame, or at the front of a hothouse, till they come up, watering them slightly when dry, as soon as they are high enough to be laid hold of, they must be pricked out in other pots, which should be placed in a shady situation, they may stand in a frame a few days till they have taken fresh root, but they must not remain long, or it will spoil them The small kinds may be propagated freely by cuttings, taken off in the young wood, and planted in sand, under a bell-glass." (*Bot. Cult* 815)

1015. *Epigæa*. From επι, upon, and γη, the earth The stem grows flat upon the ground, and throws out roots all the length of its branches A very pretty little American plant with delicate white flowers

1016 *Andromeda* Named in allusion to the virgin Andromeda, who, like this plant, was confined in a marsh, and surrounded by monsters of the waters. For an ingenious explanation of this application, see Linnæus's Flora Lapponica. The species are neat little plants, and some of them considerable shrubs and trees. They all require peat earth, and a moist situation; for those of them which do not grow naturally in bogs are mostly inhabitants of alpine regions, where the air is always more moist than on plains.

A. hypnoides has the appearance of a moss, spreads over great tracts of ground in the Lapland alps, and adorns them with its beautiful red flowers. The Andromeda is generally increased by layers, but may be also raised from seeds. "These must be very thinly covered, as they are small, and would rot if covered deep:

History, Use, Propagation, Culture,

when about an inch high they should be planted out thinly in other pots, where they will grow strong, and, when large enough, may be planted in the open ground Spring is the best time to plant them out, as the frost and worms are apt to throw them out of the ground in winter, if planted out in autumn. (*Bot. Cult* 278)

1017 *Enkianthus* From ἔγχυος, a pregnant woman, a name given to the plant by Loureiro, because the great colored buds appear as if pregnant with the flowers which afterwards appear This beautiful genus, as Sweet observes, has generally been considered difficult to propagate. the difficulty is now removed, as ripened cuttings root readily planted in pots of sand, and placed under a hand-glass, without bottom heat The best soil for it is an equal mixture of sandy loam and peat, and care must be taken not to overwater it when not in a growing state when it gets pretty large it is one of the most ornamental plants for the greenhouse or conservatory. (*Bot. Cult.* 186) There are several species confounded under the common name Enkianthus quinqueflora.

1018 *Gaultheria* Named after one Gaulthier, a French physician at Quebec A small evergreen plant, cultivated in the American border for the sake of its ornamental bright scarlet berries. The species may be increased by dividing at the root, by suckers, layers, or from seeds

1019 *Arbutus.* An ancient name of this plant, said to be traceable to the Celtic *ar bosse*, austere bush, in allusion to the roughness of the fruit. In like manner Unedo is said by Pliny to have been so called from *unum edo*, I eat one, because, being found disagreeable, no one could eat a second. *L'Arbousier*, Fr, *Landbeere*,

5970 Leaves lanceolate serrated very thin a little wavy

and Miscellaneous Particulars

Ger, and *Arbuto*, Ital This genus includes one of the most elegant of hardy shrubs, the A. unedo This evergreen is peculiarly beautiful in October and November, covered at once with blossoms and ripe fruits It is a native of the south of Europe, and is found also near Killarney in Ireland, where it has probably been brought from Spain or Italy at an early period by the priests. It grows there on limestone rocks, in greater luxuriance than it is often to be met with in the woods of Italy. in both countries the fruit is eaten, and in Spain both a sugar and spirit is extracted from it.

A uva ursi, *La Busserole*, Fr, *Barrenbeere*, Ger, and *Uva d'orzo*, Ital., is abundant in many parts of the continent, especially the alpine regions It dyes an ash color, tans leather, the berries are food for grouse and other game, and the leaves are used in medicine The fresh leaves are inodorous, and have a slightly bitter astringent taste, leaving a sweet sensation in the mouth. When properly dried and powdered, they acquire an odour similar to that of hyson tea, but the taste remains the same, the degree of bitterness only being increased (*Thomson's London Dispensatory*, 163)

It is used sometimes in calculous complaints and ulcerations of the urinary organs

The dwarf species of this genus and those of Rhododendron and Andromeda, are very fit plants for rock work. A alpina thrives best in peat kept moist and shaded. All the species may be increased by seeds, or by budding and inarching on each other: the dwarf kinds root readily by layers.

The Uva ursi has been brought into notice in modern times as an efficient remedy in nephritic and even in calculous cases European practitioners have doubted its powers, but it has found many supporters of respec-

History, Use, Propagation, Culture,

tability in North America The late professor Barton found the plant of much service in his own case of nephritic paroxysms alternating with gout in the feet It has also been recommended as a remedy in pulmonary complaints (See *Bigelow's Med Botany*)

1020 *Clethra* Κληθρα was the name given by the Greeks to the Alder, to which, in its leaves, this bears some resemblance Pretty upright North American plants, with white flowers One species is a native of Madeira

1021 *Mylocaryum* From μυλη, a mill, and καρυα, a kernel or stone, the four wings of the nut may be easily likened to the four sails of a small mill. A North American plant, with the habit of Andromeda, or rather of Clethra

1022 *Pyrola* A diminution of Pyrus, to which, in the leaves, this is thought to be similar A genus of elegant little plants, mostly evergreens They grow naturally in the shade, and in rocky or very poor soils, in the garden on sand or gravel shaded, and they are increased by seeds or young cuttings, planted under a hand-glass All the species are powerfully astringent and tonic, and one or more of the American sorts is said to constitute the chief ingredient in the scorbutic draughts of Whitlaw

P uniflora, Sir J E Smith says is one of the most curious and elegant of British flowers

1023 *Chimaphila* From χειμα, winter, and φιλεω, to love, a sort of translation of the English name winter-green The species may be treated as Pyrola, which they much resemble

1024 *Inocarpus* From ις ινος, fibre, and καρπος, fruit The envelope of the nut is composed of tough interwoven fibres. It is a lofty tree, with alternate subcordate leaves, and flowers in racemes succeeded by by nuts called *Ratta* in Otaheite The kernel of these, which is kidney-shaped, and about an inch in diameter, is eaten roasted by the inhabitants of the Society and Friendly Isles, the New Hebrides, New Guinea, the Molucca isles, &c It is sweetish, but less pleasant than the chesnut, harder and less farinaceous. The bark is astringent, and is used in the dysentery In New Guinea they smear the heads of their arrows with the expressed resinous juice (*Forst Escul*)

1025 *Styrax* A name altered by the Latins from the Arabic *asathirak* Pliny says, that the Arabs in his time used the resin to flavor the perfumes of which they are so fond S officinale is a low tree with slender branches, ovate leaves, flowers in racemes from the sides of the branches, succeeded by ovate globular juiceless drupes, containing one or two angular nuts. From this tree storax is obtained in Asiatic Turkey It issues from incisions made in the bark, and as it was formerly the custom to collect and export it in reeds, it was named Styrax calamita. It has a fragrant odour, and a pleasant subacidulous, slightly pungent, and

5971 Leaves obovate serrate beneath pubescent, Raceme simple bracted
5972 Leaves cuneate obovate acute upwards finely serrated beneath white with down
5973 Leaves broad cuneate obovate acute coarsely serrated rough on each side
5974 Leaves lanceolate obovate serrated smooth, Panicle narrow bracted
5975 Leaves oval acuminate smooth on each side glaucous beneath, Racemes white with down
5976 Leaves oblong acuminate serrated smooth, Racemes panicled, Peduncles hairy

5977 Leaves cuneate lanceolate acute, Racemes spiked terminal

5978 Stamens ascending, Style declinate, Raceme many-flowered
5979 Stamens straight, Style declinate long, Peduncle twisted, Raceme many-flowered
5980 Stamens and styles straight, Flowers racemose spreading
5981 Raceme 1-sided
5982 Stamens and styles straight, Flowers racemose closed, Petals rounded obtuse, Peduncle straight
5983 Peduncle 1-flowered

5984 Peduncles 2-flowered
5985 Peduncles umbelled

5986 The only species

5987 Leaves ovate beneath villous, Racemes simple shorter than the leaf
5988 Leaves obovate villous beneath, Lower peduncles axillary solitary 1-flowered
5989 Leaves subsessile oval or obovate beneath powdery, Fl axill. and term in threes on short stalks
5990 Leaves oblong smooth on each side, Peduncles axillary 1-flowered solitary or twin

5991 Root creeping, Stems erect with peduncles and calyxes villous, Lower leaves spatulate upper lanceolate
5992 Erect villous, Flowers tetrapetalous octandrous stalked
5993 Erect, Flowers tetrapetalous octandrous stalked, Caps many-valved, Leaves lanceolate
5994 Erect smooth, Flowers tetrapetalous octandrous sessile
5995 Flowers tetrapetalous octandrous, Stem erect angul. hairy, Leaves oblong hairy

5996 Leaves opposite ovate, Flowers panicled, Bractes lanceolate

aromatic taste, is stimulant, and in some degree expectorant It was formerly much prescribed in asthma, catarrh, phthisis, and menstrual obstructions, but it is now scarcely ever employed, except as an adjunct on account of its fragrance.

Benzoin is obtained from the S. Benzoin, by wounding the bark near the origin of the lower branches The tree is never wounded under six years of age, and cannot sustain these annual incisions above twelve years (*Thomson's London Dispensatory*, 525)

As shrubs this genus affords some plants that may be considered pretty and desirable, on account of their small size and free flowering They grow best in sandy loam, are commonly propagated by layers, and may also be increased by seeds, which they occasionally ripen

1026 *Jussiæa* An obscure and most uninteresting genus of plants, selected, not very happily, to commemorate the family of the Jussieus, which has for more than a century and a half been at the head of botanical science Antoine de Jussieu, born in 1686, and died in 1758, was professor of botany at the Jardin du Roi, and member of the academy of sciences He published various papers upon exotic plants, and a discourse upon the progress of botany He also edited the works of Barrelier. Bernard de Jussieu, his brother, born in 1698, died in 1777, was professor at the same garden, and member of the same academy He also was author of various papers upon plants, a second edition of Tournefort's History of the Plants growing near Paris, and an arrangement of the plants growing in the garden of Trianon, which was published by his nephew Joseph de Jussieu, a third brother, born in 1704, and died 1779 He was sent to South America by Louis XV, and remained there for six and thirty years He made many discoveries, and brought home many new plants Lastly, Antoine Laurent de Jussieu, their nephew, born in 1748, and still living, as demonstrator of botany at the Jardin du Roi, member of the Institute and of every learned body in Europe He brought, in his Genera Plantarum, published in 1789, to a degree of extraordinary perfection, that system, the outlines of which had been traced by the hand of Tournefort, and partially filled up by his uncle Bernard. That system has now superseded, among men of science, all others, and if as yet inapplicable to merely popular purposes, can never be dispensed with in all philosophical investigations.

1027 *Getonia* A Malabar plant, the meaning of whose name has not been explained. Cuttings root freely in sand, under a hand-glass, and plunged in heat.

History, Use, Propagation, Culture,

1028. *Quisqualis* A Latin word, expressive of uncertainty It was given by Rumphius to a tree of Amboyna, because it was subject to variation It is a fine climbing genus of easy culture The best soil for the species is a mixture of loam and peat, and cuttings root freely in sand, under a hand-glass. (*Bot. Cult* 100)

1029 *Melastoma* From μελας, black, and στομα, mouth Many of the species produce black berries similar to gooseberries, and which stain the mouth black This is a very numerous genus of shrubs and low trees, the species display great unity of character, and may be considered ornamental They require but little water in winter, and are easily increased in sand, plunged in a moist heat

1030. *Petaloma.* From πεταλον, a petal, and λωμα, an edge Flowers of which the petals are inserted on the edge of the calyx A small plant with the leaves, but not flowers, of Melastoma

1031. *Acisanthera.* From ακις, a point, the anthers being pointed. Plants with the habit of Melastoma.

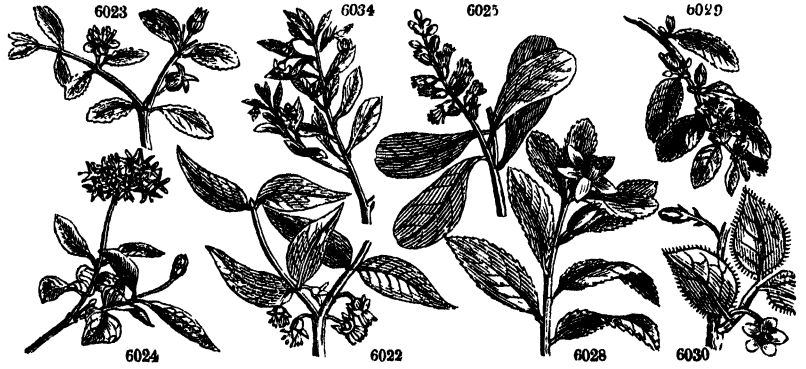
5997 Leaves ovate
5998 Leaves subcordate pubescent

5999 Leaves ovate-lanc. entire 3-nerved rough, Fl terminal subcorymbose
6000 Leaves 3 nerved entire sessile ovate acute villous silky, Racemes brachiate, Stems square
6001 Leaves 3-nerved without a marginal one entire smooth on each side thin, Racemes term Fls sessile
6002 Leaves entire 3-nerved ovate-lanc smooth, Margin and nerves hispid beneath, Fl terminal
6003 Leaves entire 3-nerved oblong emarginate at base, Raceme erect term. Fl. tetrandrous
6004 Leaves toothletted 5-nerved ovate-lanceolate, Stem hispid
6005 Leaves ovate acuminate toothletted 5-nerved, Cymes axillary
6006 Leaves cordate acumin 5-nerved serrulate pubescent, Cymes terminal, Sepals roundish, Stamens 5 sterile
6007 Leaves cordate subcrenate beneath rusty with down, Flowers axillary and lateral solitary sessile
6008 Leaves ovate lanceolate acuminate 5-nerved pilose somewhat toothletted, Branches bifid, Panic term
6009 Leaves entire 5-nerved subcordate scabrous, Cor little hairy outside
6010 Leaves entire 5-nerved lanceolate ovate rough
6011 Leaves 7-nerved ovate subcordate acuminate ciliated with teeth, Corymb terminal, Flowers 1-sided
6012 Leaves 3-nerved without ribs ovate-lanceol. acuminate toothletted, Corymbs term trichotomous powdery
6013 Leaves 5-nerved obl lanceol. acute entire hoary beneath, Pedunc. umbelled, Bractes double

6014 Leaves 5-nerved entire ovate acute smooth above beneath hoary, Flowers clustered sessile
6015 Leaves entire 5-nerved ovate-oblong smoothish acuminate smooth at edge
6016 Leaves 5-nerved nearly entire oblong acuminate smooth beneath yellowish, Racemes cymose
6017 Leaves lanceolate ciliated 3-nerved obtuse at base, Stems square, Flowers terminal solitary
6018 Leaves cordate oval entire stalked beneath woolly, Petals obcordate, Petals bowed at base
6019 Branches winged, Leaves oval-lanceol with a long point, Petals obovate pointed, Filam. woolly above
6020 Leaves oblong elliptical 3-nerved ciliated, Calyx setose at end
6021 Stamens 12, Leaves ovate-lanceolate 5-nerved, Stems and globose ovaries very hispid

6022 Peduncles solitary 1-flowered

6023 Leaves 3-nerved ovate crenate opposite



6024 Leaves obovate obtuse, Flowers 5-cleft decandrous

6025 Spikes elongated, Leaves wedge-shaped smooth

6026 Flowers octandrous, Leaves cordate smooth
6027 Flowers dodecandrous, Leaves ovate downy beneath
6028 Flowers 12-androus, Leaves ovate oblong serrulate
6029 Flowers 12-androus clustered, Leaves oblong obtuse serrated pubescent on each side

DIGYNIA.

6030 Leaves ovate roughish
6031 Leaves cordate oblong downy beneath
6032 Leaves oblong obovate obtuse smooth
6033 Leaves lanceolate smooth
6034 Leaves obovate lanceolate pubescent
6035 Leaves oblong lanceolate very villous
6036 Leaves lanceolate acute hairy beneath
6037 Leaves obovate villous coriaceous, Fl stalked polyandrous polygynous
6038 Leaves elliptical, Flowers polyandrous polygynous

and Miscellaneous Particulars.

1032 *Dasi* A name of unknown application The plant resembles in its leaves the Rhus cotinus, whence its specific name. It may be increased by cuttings of the roots placed in a warm situation

1033 *Lucida.* From *βους*, an ox The form of the fruit when ripe resembles the horn of such an animal This tree grows in Jamaica in low swampy lands near the coast; it is remarkable for its slender crooked branches, and the tufted disposition of the leaves. it grows to a considerable size, is reckened an excellent timber tree, and the bark is greatly esteemed by the tanners.

Well ripened cuttings root in sand, plunged in heat, and covered

1034. *Samyda.* *Σαμυδα* is the Greek name of the birch, to which this genus may be likened in its leaves The species are rather tardy in growth, but not difficult to root in sand under a hand-glass

1035. *Royena.* So named by Linnæus, in honor of Adrian Van Royen, who with his son David were successively professors of botany at Leyden It consists of shrubs of little beauty, which are increased by ripened cuttings in sand under a hand glass They are chiefly natives of the Cape of Good Hope

History, Use, Propagation, Culture,

1036 *Trianthema* From τρεις, three, and ανθος, flower, the flowers growing by threes in the axillæ of the leaves. The species are weeds in their native countries, and of little interest here

1037 *Scleranthus* From σκληρος, hard, and ανθος, a flower, when in seed the envelopes of the flower appear very much indurated S annuus is common throughout Europe and Siberia on a sandy soil. It flowers about the middle of summer, and sows its seeds very abundantly in autumn, which produce a crop of young plants that generally survive the winter, or, if destroyed, are replaced by another crop arising from those seeds that happen not to vegetate till spring (*Eng Bot*) The Swedes and Germans receive the vapour arising from a decoction of it into their mouths, to cure the tooth-ache (*Withering*)

S. perennis in several parts of Europe has its roots attacked by the insect Coccus Polonicus, *Lin.* which yields a fine crimson dye, and is said likewise to live on S. annuus and some Potentillæ Sir J. Smith has "never been able to find this insect on these plants in England" (*Flora Brit* ii 283)

These two species are occasionally found in abundance upon barren heathy wastes

1038. *Cunonia.* In memory of John Christian Cuno, of Amsterdam, who described his own garden in Dutch verse in 1750. This is a handsome tree, with fine shining green foliage, contrasted by numerous dense elongated branches of small milk-white flowers, and twigs of a red color having the habit of a tropical rather than of a Cape plant Its colonial name is *Rood Elze* (red alder), although the tree has not in any point of view the least resemblance to the alder of Europe.

1039 *Hydrangea.* From ὑδωρ, water, and αγγειον, a vessel The common garden species, H. hortensis, is quite a marsh plant, and to be managed well should have a very copious supply of water in summer A large plant will consume ten or twelve gallons daily, in warm weather

H quercifolia is an elegant plant when in leaf, but as it is barely within the limits of ligneous plants, it dies down to the ground on the approach of frost. H. hortensis is much valued on account of the great profusion of its very elegant flowers, which are monstrous in the same manner as the Viburnum opulus. It has never

6039 Flowers pentandrous monogynous

6057 Radical leaves aggreg lanc. obov with cartilaginous teeth, Stem leafy clammy, Calyxes glandular
6058 Leaves rad. lingulate with a cartilaginous repand edge, Stem racemose leafy, Cal with gland hairs
6059 Leaves obl. lanc hairy toothletted, Stem naked, Peduncles alternate in corymbose heads
6060 Leaves obl. lanc. smooth repand toothed, Stem naked, Peduncles 1-flowered aggregate
6061 Smoothish, Leaves oblong-lanc acute eroded, Stem naked, Panicle oblong
6062 Leaves roundish toothed with long stalks, Stem naked
6063 Leaves obovate retuse with cartilaginous crenæ, Stem naked panicled
6064 Leaves cordate oval retuse with cartilaginous crenæ, Stem naked panicled
6065 Leaves reniform toothed, Stem naked panicled
6066 Leaves cuneiform very obtuse repand, Stem naked panicled
6067 Very hairy, Lvs elongate spatulate acutely toothed, Stems divaricate dichotomous, Panic. capillary lax
6068 Leaves roundish toothed hairy, Runners creeping, Two petals long
6069 Leaves rhomboid-toothed variegated hairy, Runners very weak, Petals nearly equal
6070 Leaves cuneate obovate somewhat toothed shorter than stalk, Stem panicled
6071 Leaves roundish cuneate crenate in front, Stem naked simple, Flowers clustered racemose

and Miscellaneous Particulars

been found in a wild state, but is extensively cultivated in the gardens of China and Japan, from whence it was introduced to Kew by Sir Joseph Banks The flowers are almost always barren; they are naturally of a rose color, but under certain circumstances of culture they become blue. The yellow loam of Hampstead Heath and some other places, and some sorts of peat earth are found to produce this effect, but the cause is not yet ascertained. Dr Daalen, of Antwerp, finds that turf-ashes, and, still more effectually, those of the Norway spruce, the wood generally used as fuel by him, applied to the roots of Hydrangea, produced the blue color of the petals (*Neil's Hort Journ* 122.) According to Busch, of Petersburgh, "the hydrangea will be turned blue by watering the young plant, the summer before, with alum water Our grey colored earth, under the black moor-earth, has the same effect, being combined with aluminous salt." (*Hort. Trans* vol iv. 568.) Sweet recommends a bed of peat, and says, the longer it remains there the bluer will be the flowers

The hydrangea, to flower freely, must not be allowed more than three or four strong shoots from the same root, it must have abundance of pot room, and plenty of water when in flower. It is a good plan to shift the plants twice or oftener during the early part of the season If plunged and turned out of the pot into an open border in the end of May, they will flower vigorously, and will even stand the winter around and south of London, and flower yearly, and if well protected in winter very freely and strongly. The flowers are produced from the extremities of the shoots of the current year.

1040 *Chrysosplenium* From χρυσος, gold, and σπλην, the spleen; a figurative name applied to this plant, with reference to its medicinal qualities It is said to be a powerful cathartic In the Vosges the plants are used copiously as a salad, under the name of *Cresson de Roche.*

1041. *Saxifraga. Saxum-frango,* to break the stone, a name contrived in reference to supposed medicinal qualities which are now forgotten.

An elegant genus of alpine plants, which have long been favorites in gardens. Many of the species are

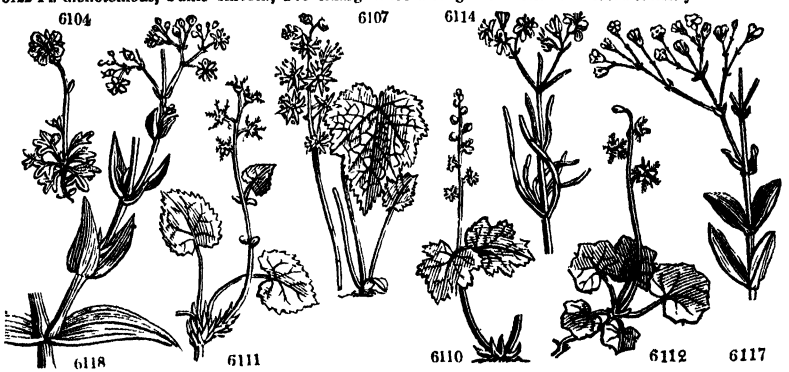
History, Use, Propagation, Culture,

quite easy to cultivate, and although naturally mountaineers, not incapable of breathing the more impure air of towns and vallies. The greater part known are delicate and difficult to rear they are regardless of cold, but suffer from mild and humid weather during the winter months Most of the species are perennial, with either fibrous or granular roots, and a few are annual Of the latter one species, S tridactylites, is common upon very old walls in England, flowering in the beginning of the spring. The parts of fructification are extremely variable in this genus, and have given rise to the construction of many supposed genera, the constituents of which have the recommendation of agreeing with one another pretty well in habit The limits, however, of these genera are too obscure, and the gradations by which they are united so obvious, that they have not yet been adopted by men of science generally Without interfering with that question, the old mode of considering Saxifrage has been here adhered to, as being the most popular and the best under-

6072 Leaves obovate crenate subsessile, Stem naked, Flowers headed
6073 Leaves serrate, Stem naked branched, Petals acuminate
6074 Leaves lanc. mucronate with a cartilaginous ciliated edge, Stem naked few-fl Cal. obtuse
6075 Leaves linear perforated dotted aggregate recurved, Stem many-fl.
6076 Leaves lanc. obtuse hairy, Stem naked 2-flowered
6077 Leaves ovate opposite imbricated: the upper ciliated
6078 Cauline leaves lanc alternate ciliated, Stems procumbent
6079 Cauline leaves lanc alternate naked unarmed, Stem erect
6080 Cauline leaves lin subul scattered naked unarmed, Stem decumbent
6081 Cauline leaves linear alternate ciliated radical aggregate
6082 Cauline leaves reniform toothed stalked, Stem panicled
6083 Cauline leaves reniform lobed, Stem branched, Root granular

6084 Cauline leaves palmate stalked, Stem very simple 1-fl bulbiferous
6085 Cauline leaves palmate: the upper floral ovate, Stem simple about 2-flowered
6086 Cauline leaves ovate lobed, Stem filiform weak
6087 Leaves cuneiform 3-parted with trifid linear segments, Stem simple ascending, Petals lanceolate
6088 Radical leaves reniform 5-lobed many-cleft, Cauline linear, Stem nearly naked branched
6089 Rad. lvs reniform pedatifid 7-lobed, Caul palmate and lin Stem nearly naked branched, Pet lin obov.
6090 Smooth, Radical leaves 3-lobed, Lobes many-cut, lateral segments falcate, Stem panicled, Cal colored
6091 Radic. leaves palm. 5-parted, Cauline linear undivided, Stems ascending many-fl.
6092 Leaves hairy trifid or 5-fid bearded, Runners procumbent, Stem leafy, Petals obovate rounded
6093 Leaves reniform palm hairy, Stem and flower-stalks filiform
6094 Caul leaves wedge-shaped trifid alternate, Stem erect branched
6095 Leaves wedge-shaped, Radic. entire and 3-toothed, Cauline 5 toothed, upper trifid, Pedunc. about 3-fl.
6096 Leaves palmate 3-parted, Segments subtrifid, Stem branched ascending
6097 Leaves cuneiform palmate 5-fid ciliated longer than the linear petiole, Runners very short tufted
6098 Leaves hairy 3 or 5-parted, Lobes elliptical acute, Runners ascending, Petals obovate 3-nerved
6099 Leaves hairy palmate 5-cleft and trifid, Stem leafy panicled, Petals roundish
6100 Leaves ciliated cuneate trifid nearly 5 cleft, Pedunc solitary elongate 1-fl
6101 Cauline leaves lin entire and trifid, Runners procumbent, Stem erect nearly naked
6102 Radic leaves aggregate entire and trifid acute linear, Stem viscid nearly racemose, Petals length of cal.
6103 Radic. leaves aggregate membranous lin lanceolate entire or trifid, Stem nearly naked about 2-fl.



6104 Radic leaves aggr linear obtuse trifid cut, Stem erect many-fl Petals twice as long as cal
6105 Leaves imbric cuneate-palmate ciliated, Petals round, Styles spreading, Stigmas flat woolly
6106 Radical leaves aggregate entire and trifid oblong obtuse, Stem filiform about 2-fl, Pet as long as calyx

6107 Leaves cordate acutely lobed toothed, Scape racemose
6108 Leaves ovate cordate acute shortly lobed toothed, Raceme filiform spiked
6109 Leaves biternate

6110 Leaves cordate about 3-lobed toothed, Scape 2-leaved
6111 Leaves orbiculate reniform doubly crenate lucid, Scape setaceous lucid
6112 Leaves reniform repand ciliated, Scape naked

1 *Calyxes not scaly*

6113 Flowers clustered, Stems simple roughish, Leaves linear fleshy
6114 Flowers corymbose, Stem ascending, Leaves lanc lin obsoletely 3-cornered obt. 1-sided, Stam exserted
6115 Flowers corymbose, Petals rarely subemarginate, Leaves linear fleshy smooth flat
6116 Flowers corymbose, Branches divaricating, Leaves ovate lanc smooth at the base cordate amplexicaul.
6117 Branches spreading, Flowers panicled small, Pan much branched, Fl-stalks viscid
6118 Flowers panicled, Panic much branched polished, Leaves ovate lanc halt stem-clasping
6119 Fl trichotomous panicled, Pedunc villous viscid, Petals emarginate twice as long as calyx
6120 Fl panicled very minute dioecious, Peduncles smooth filiform divaricating, Leaves lin lanc rough
6121 Fl panicled, Panic divaricating, Branches few-flowered pubescent viscid, Leaves lin lanc obtuse
6122 Fl. dichotomous, Panic smooth, Pet emarg twice as long as cal Leaves lanceolate fleshy

and Miscellaneous Particulars

stood. The species are subject to great variation in appearance, and to much diversity of opinion among those who profess to be best acquainted with them A middle course has here been taken, by which the doubtful kinds have been omitted, and those which are recognised, if not defined, satisfactorily, are alone admitted

1042. *Tsarella* From *tsara*, a particular kind of head-dress, a mitre, in allusion to the form of its capsule Pretty little North American herbaceous plants, related to saxifrage, and easily cultivated in pots of light sandy peat and loam

1043. *Mitella* A diminutive of *mitra*, a mitre, so named for the same reason as the last genus, which it altogether resembles in habit and constitution

1044 *Gypsophila*. From γυψος, chalk, and φιλεω, to love, most of the species delight in chalky districts.

History, Use, Propagation, Culture,

Some of the species are fine border plants, but the greater part are of little beauty, and only grown in botanic gardens

1045 *Saponaria* In allusion to its mucilaginous sap, which is said to be fit for supplying the place of soap, *sapo* S officinalis plena is considered a border flower, but is inconvenient unless kept in pots, from its spreading very much by the roots, which are underground creepers, like those of couch The leaves form a lather with soap, and take out spots of grease in the same manner The whole plant is bitter, and was formerly used to cure the itch and the venereal disease

1046 *Dianthus* Διος, ανθος, the flower of God, or divine flower, so named on account of its pre eminent beauty Most of the species of this genus are highly valued, not only for the beauty of their flowers, but also as being evergreens, their foliage during winter being as abundant and vivid as in summer The fragrance of some of the species is peculiarly grateful, and no plant in this respect surpasses the carnation D barbatus is an old inhabitant of the flower garden, and was much esteemed in Gerarde's time "for its beauty to deck up the bosoms of the beautiful, and garlands and crowns for pleasure" The varieties are numerous, but as the plant has never been treated by florists as a leading flower, they have not been named or improved A hybrid variety called the Mule, or Fairchild's Sweet-William, is supposed to have been produced from seeds of the

6123 Fl panic. Stem diffuse, Leaves lin lanc. grassy carinate cæsious
6124 Stems panic few-fl Stam shorter than emarginate petals, Leaves linear smooth
6125 Petals obovate emarginate campan Stamens shorter than corolla, Leaves linear somewhat fleshy
6126 Stems panicled, Styles longer than emarginate petals, Leaves lin lanc smooth
6127 Stem dichotomous panicled much branched, Fl axill solitary, Leaves lin flat as long as fl.-stalks

2 *Calyxes supported by 2-4 scarious scales*

6128 Stems numerous erect stiff, Fl panicled terminal, Leaves linear rigid

6129 Flowers fascicled panicled, Cal rounded villous yellowish, Leaves ovate lanc acute or not

6130 Fl panicled, Cal pyramid 5-ang smooth, Bractes membranous acute, Leaves ovate lanc sessile
6131 Stem erect, Branches divaric with clammy hairs, Fl on long stalks axill. Leaves lanc linear
6132 Stems erect branched, Fl panic and corymbose, Cal slender glandular purple, Lvs ovate lanc. 1-nerved
6133 Stem dichotomous, Branches divaricating, Fl axill Cal hispid round, Leaves linear spatulate
6134 Tufted, Stems 2-leaved, Flowers headed with an involucre, Cal woolly

§ 1 *Flowers capitate or corymbose, sessile or stalked*

* *Bractes ovate, blunt*

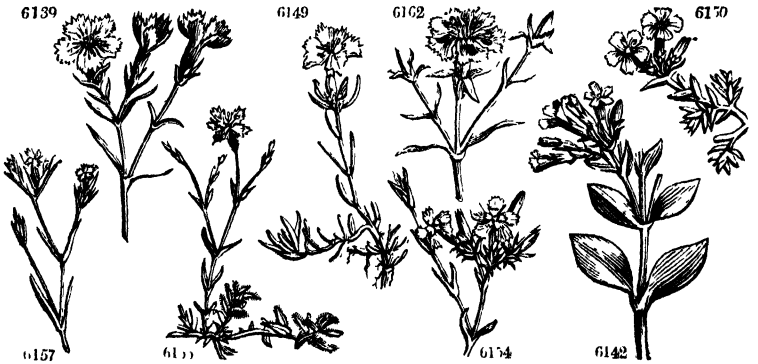
6135 Scales of calyx ovate pointless longer than tube, Leaves serrulate
6136 Like the last, but the flowers nearly solitary

** *Bractes lanceolate, acute, Calyxes villous*

6137 Flowers loosely bundled, Scales lanc subul as long as tube, Leaves subulate, Calyxes hairy
6138 Flowers densely bundled, Scales ovate subul as long as tube, Pet beard Lvs subul pub rough upright
6139 Fls aggreg Scales long than cal striat rough, Lvs lin short than joints rough, Stem simple rough upw

*** *Bractes ovate or lanceolate, Calyxes smooth*

6140 Flowers aggregate fascicled, Scales ovate subulate as long as tube, Leaves lanceolate
6141 Flowers aggregate racemose corymbose, Scales ovate lanceolate finally longer than calyx, Lvs obl. lanc.
6142 Flowers aggregate fascicled, Scales acute ciliated twice as short as tube, Leaves ovate short
6143 Fls subsess capitate, Scales imbric mucron at end spreading a little short than tube, Lvs long narrow
6144 Glaucous, Fls sess capitate, Scales broad ovate with a long awn longer than head, Upper lvs dilat. at base
6145 Dark green, Flowers sessile capitate, Scales ovate very short pointless, Leaves narrow rough



β Flowers panicled fastigiate and solitary stalked

6146 Fl aggregate, Involucres and scales scarious rufous oblong awned a little shorter than cal
6147 Fl aggregate sessile and stalked, Scales ovate awned shorter than tube, Leaves linear 3-nerved
6148 Like the last, but flowers aggregate headed sessile 8
6149 Flowers aggregate, Claws of petals very long, Scales mucronulate closely imbricated, Leaves subul fleshy
6150 Flowers aggregate, Claws of pet as long as cal Scales mucr closely imbric very short, Leaves lanc. obt
6151 Flowers aggregate, Scales ovate subulate thrice as short as tube, Leaves lin lanc narrowed at each end
6152 Flowers aggregate on long stalks, Scales twice as short as tube

§ 2 *Flowers panicled or solitary*

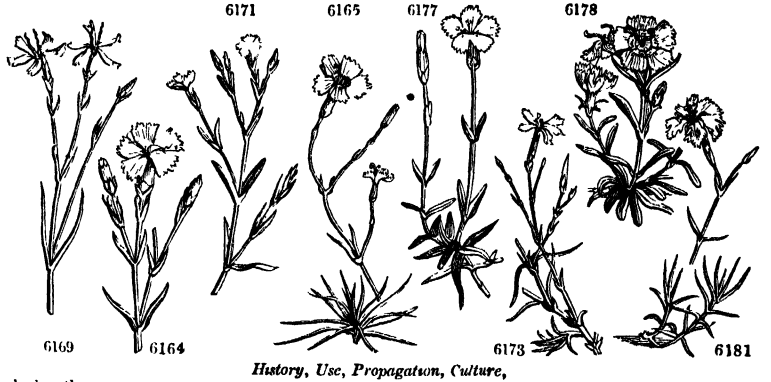
* *Petals toothed*

6153 Flowers fascicled, Scales ovate lanceolate shorter than tube, Petals acutely toothed, Lvs lin. lanc rough
6154 Like the last, but the flowers more numerous, and the leaves linear lanc
6155 Stem panicled somewhat hairy, Fl sol Scales ovate acute twice as short as cal Leaves subul.
6156 Flowers fascicled twin, Scales awned as long as calyx, Petals crenate, Stem decumbent, Lvs lanc obt.
6157 Flowers somewhat corymbose, Scales furrowed mucron twice as short as tube, Stems diffuse smoothish
6158 Flowers nearly sol Scales ovate mucron much shorter than cal Pet crenate, Lvs subul rough at edge
6159 Stem panicled smooth, Flowers solitary, Scales ovate awned as long as tube, Leaves subulate nerved
6160 Stem many-fl smooth, Scales cuspid spreading shorter than tube, Pet downy at orifice, Lvs lin roughish
6161 Stem panicled, Fl sol Scales acuminate appressed, Petals acutely toothed, Leaves subul lanc
6162 Stem branched, Fl sol Scales linear leafy, Petals toothed, Leaves lin lanc

and Miscellaneous Particulars

carnation impregnated by a Sweet-William D caryophyllus is considered the source whence have sprung the numerous varieties of the carnation, and some think those also of the pink The pink, however, is more probably derived from some of the smaller growing species, as plumarius, deltoides, armeria, carthusianorum, &c.

The carnation is rarely found wild in England, but it may be gathered on the south side of the Swiss Alps It seems to have been unknown to the ancients, at least in its cultivated state, not being mentioned by Pliny, or sung by any of the Roman poets. It has, however, been cultivated from time immemorial in Europe, and is in the highest favor for its beauty and rich spicy odour It is the principal florist's flower of Germany and Italy, from which countries the British florists procure their best carnation seed, and also some esteemed varieties



The varieties of carnation amounted to nearly 400 named sorts in the beginning of the eighteenth century, and the number has not since diminished. They are arranged in three classes, flakes, bizarres, and picotees Flakes have two colors only, and their stripes large, going quite through the leaves, *bizarres*, Fr (odd, irregular) are variegated in irregular spots and stripes, and with no less than three colours, *picotees*, Fr. (*piquetée*, pricked or spotted) have a white ground, spotted or pounced with scarlet, red, purple, or other colors Of

History, Use, Propagation, Culture,

each class there are numerous varieties, arranged under the farther subdivisions of scarlet flake, pink flake, purple flake, yellow flake, &c , scarlet bizarre, crimson bizarre, &c , and purple picotee, yellow picotee, &c

Picotees are rather smaller flowers than carnations, and are distinguished by the serrated margins of their petals, the colors are principally yellow and white spotted, and the plants are considered hardier than the other sorts Whatever colors the flower may be possessed of, they should be perfectly distinct, and disposed in long regular stripes, broadest at the edge of the lamina, and gradually becoming narrower as they approach the unguis, or base of the petal, there terminating in a fine point Each petal should have a due proportion of white, *i e* one half, or nearly so, which should be perfectly clear and free from spots. Bizarres, or such as contain two colors upon a white ground, are esteemed rather preferable to flakes, which have but one, especially when their colors are remarkably rich, and very regularly distributed. Scarlet, purple, and pink are the three colors most predominant in the carnation, the two first are seldom to be met with in the same flower, but the two last are very frequently

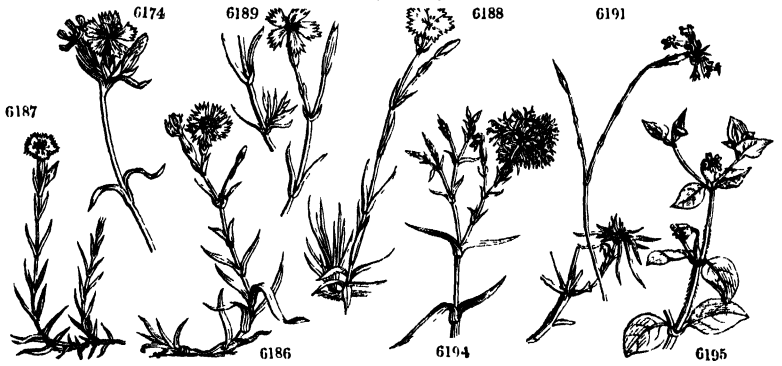
New varieties are procured from seeds, and thousands of seedlings are annually blown by florists and amateurs, sometimes without one being found worth keeping Established or approved varieties are continued by layering and cuttings, or, as they are commonly called, pipings The soil in which the carnation thrives best is a rich loam rather sandy than otherwise, the climate should be free from extremes of every kind, for which reason they are commonly grown in pots, and protected by a frame during winter, and covered by an awning while in bloom Carnations grow exceedingly well in beds of properly prepared soil, over which frames are placed in winter, and an awning of canvass or bunting when the plants are in blossom Those who are curious in blowing their carnations have a great many nice and curious operations to perform when they come into flower Such petals as are plain, or run from the proper colors of the variety, are extracted by a particular instrument, the remaining petals are next arranged so as to form a convex imbricated surface; the calyx being slit down or tied up as may be necessary to aid this end Then the flowerstalks are neatly tied to sticks, and the flower supported in a pendant attitude by means of properly formed brass wires.

6163 Stem branch upw. closely dichotom Fl sol. Bract. with a spread leafy point, Lvs lin. subul. 3-nerv. hairy
6164 Stem branched, Fl sol. Scales very short ovate, Petals very broad beardless, Lvs. lin. sub. channelled glauc

6165 Stem branched or simple, Fl. sol Scales very short 4 ovate, Pet. broad beardless toothed

6166 Stem dichotomous panicled many-fl glaucous, Fl sol Scales 4 pungent spreading shorter than tube

6167 Fl. sol subcorymb Scales ov lanc short than tube, Lvs lin lanc obsol 3-nerv. smooth, Pet twice toothed
6168 Fl sol Scales ovate acute very short, Petals emarginate or nearly entire
6169 Stem branched, Fl sol Scales ovate acute very short awned, Pet lanc narrow, Leaves subul roughish
6170 Stem few-fl Fl sol Scales very short mucron spreading, Tube gibbous, Pet entire, Lvs cæspitose subul.
6171 Stem decumb branched, Fl sol Scales ovate lanc acute twin, Upper leaves narr acute: lower oblong obt
6172 Like the last, but flowers white, Leaves and stem glaucous
6173 Stem branched, Fl sol Scales 6 lanc. appressed, Pet smooth cuneate obovate, Lvs lin acum channelled
6174 Stems tufted few-fl Fl sol Scales ovate acute short, Leaves subul spreading downy rough
6175 Stem 1-fl Scales 2 ovate acute short spreading, Cal contracted in middle, Lvs. lin. chann roughish at edge
6176 Stem 1-fl Scales 4 acute short, Petals bearded doubly serrated, Leaves lin spreading
6177 Stems tufted about 1-fl Scales roundish short, Pet. crenate downy, Leaves bluntish rough at edge
6178 Stem 1-fl Outer scales as long as tube inner much shorter, Pet crenate, Leaves obl obtuse
6179 Pedunc bind term Scales lanc cusp erect short than tube, Pet. cut, Lvs lin nerved serrul rough at edge
6180 Stems about 2-fl. Scales 4 ovate acute twice as short as tube, Petals serrate downy, Leaves linear
6181 Stem about 1-fl Scales obovate mucronate, Pet beardless many-cut, Leaves subul entire smooth nerved



** *Petals fringed*

6182 Stems ascending about 1-fl Scales short ovate, Pet toothed many-cut, Leaves lin ciliated
6183 Fl sol Scales 4 lanc short, Petals emarginate at the end fringed toothed
6184 Glaucous, Stems 2-3-fl Teeth blunt, Bractes ovate very short pointed, Leaves lin rough at edge
6185 Like the last, but the petals bearded at their orifice
6186 Stem pan few-fl Fl sol Scales ovate acum Petals equally cut crenate, Leaves glaucous rough at edge
6187 Stems 1-fl Scales ovate lanceolate acuminate shorter than tube, Pet beardless, Lvs subul rough at edge
6188 Stem branched few-fl Scales 4 blunt short, Petals beardless dotted, Leaves glaucous linear flaccid
6189 Stems 1-fl Scales ovate obtuse four times as short as calyxes, Pet naked, Leaves subul glauc ciliated
6190 Stems 1-fl Scales ovate obtuse, Leaves linear
6191 Stem half-shrubby branched at base 2-fl Scales 6 lanc shorter than cal Leaves subul rough

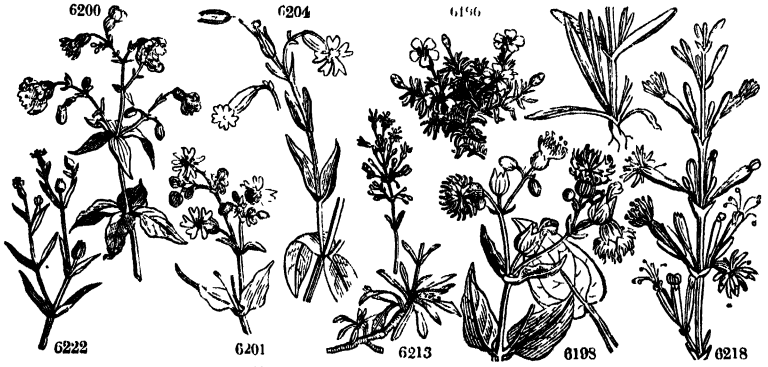
6192 Fl scattered solitary, Scales lanc lin spreading a little shorter than tube, Leaves lin nerved flaccid
6193 Stem panicled few-fl Fl sol Scales subul straight twice as short as tube, Petals digitate, Lvs lin serrul
6194 Stem panic many-fl Fl fastigiate, Scales short ov. mucron Pet. beyond the middle pinn. many-cut hairy
[at orifice

TRIGYNIA.

6195 Branches divaricating, Leaves ovate, Cal campanulate, Pet distant

and Miscellaneous Particulars

Behind the petals a circle of card paper is sometimes fixed to keep them in position, and the pot in which the plant grows is placed on a particular description of saucer, by which it is surrounded by water, in order to prevent the approach of ground insects, and especially of the earwig These and a number of other operations will be found described at length in Maddock's Florist's Directory, and in the Encyclopædia of Gardening. (Sec. 6406)



The pink, as a florist's flower, is of much less antiquity than the carnation: it is scarcely mentioned by Gerarde, and Parkinson has given very few varieties It was chiefly grown as a border flower till within the last fifty years, since which it has been greatly improved and many fine varieties originated Being one of the hardiest and least expensive of fine flowers, it is much cultivated by operative mechanics and manufacturers round large towns, and no where to such an extent as about Paisley, by the muslin weavers there

The varieties of pink most cultivated are chiefly those called pheasant's eyes, which seem to have sprung from D. plumarius Cob pinks are a large sort seemingly intermediate between pinks and picotee carnations, red early pinks are smaller plants than cobs, but larger than pheasant's eyes, and seem to have sprung from cobs and D armerius or deltoides The Paisley growers reckon above three hundred varieties of the pheasant's eyes -To garden pinks in general Wildenow gives the appellation of D hortensis.

The propagation and culture of the pink is the same as that of the carnation, excepting that it is less frequently kept in pots or frames, but planted in beds of fresh loamy soil, and the small side shoots reduced in the autumn in order to throw more strength into those intended to produce flowers the following season. Some cover their pink bed with an awning Not more than eight or ten flowers are ever allowed to expand on one plant, and these, if they shew a tendency to bursting at the calyx, are to be tied as in carnation culture.

1047. *Cucubalus.* A name signifying a bad subject; an evil weed. According to Miller, the berries of this plant are no less deadly than those of Nightshade.

History, Use, Propagation, Culture,

1048 *Silene* A poetical name, after the God Silenus, who is represented as always drunk and covered with slaver, as the species of this genus usually are with a viscid secretion This is a large family of small plants, neither remarkable for use, beauty, or as bad weeds S inflata, the Cucubalus Behen *L*, may be used as a substitute for asparagus or green pease, the young shoots having the flavor of both They ought to be gathered

§ 1. *Tufted, Stems scarcely any, Calyx somewhat inflated, Peduncles 1-flowered.*

6196 Smooth, Stems dense, Leaves lin lanc Flowers dioecious, Calyx campanulate
6197 Stems less dense, Leaves lin spatulate pubescent, Cal inflated hairy

§ 2 *Caulescent, Flowers solitary or panicled, Calyx bladdery inflated*

6198 Pubescent, Leaves large ovate-lanc Fl in large panicles, Cal much inflated, Petals fringed
6199 Hispid, Leaves ovate-lanc on long stalks wavy, Cal much inflated, Pet lacerated crowned
6200 Stems erect branched pubescent, Leaves 4 whorled lanc with long points smooth, Fl pan Cal bladdery
6201 Stems branched, Fl pan Cal bladdery ovate, Pet bifid naked, Styles very long
6202 Like the last, but hairy with ovate lanc. leaves
6203 Like the last, but creeping with smaller nearly spatulate leaves
6204 Smooth branch Lvs lanc the lower stalk Fl pan. Cal ovate veiny, Pet with 2 very short lobes crowned
6205 Pubescent, Stems very tall branch Lvs large lanc Fl pan Cal ov netted, Pet with a claw hairy at base
6206 Smooth, Stem erect simple rather leafy, Lvs lin scarcely ciliat Fl in pan spikes, Claws of pet not ciliated
6207 Smooth with very leafy branched procumbent stems, Leaves lanc Fl axill opp and terminal, Petals bifid
6208 Nearly smooth, Stems little branched, Leaves obovate serrulate-ciliated, Fl pan Pet obcordate crowned
6209 Hoary, Stem erect branched, Leaves lanc the upper linear, Fl few term Petals O
6210 Stems procumb. diffuse 2-3-chotomous branched, Lvs small lin Petals half-bifid with an obcord crown
6211 Nearly smooth, Stems wavy branched leafy, Leaves lin lanceolate, Petals 2-lobed
6212 Smooth, Stem erect, Leaves acute glaucous, Fl solitary, Pet lanceolate with a 2-lobed crown

§ 3 *Caulescent, Flowers spiked in whorls* [Fl small dioecious

6213 Leaves erect, with a few branches, which are scarcely pubesc or leafy, Lower lvs numerous spatul fleshy,
6214 Stem pubesc branched, Lower leaves large lanc spatulate upper lin long, Fl panicled with linear petals
6215 Hoary, Stems assurgent nearly simple, Leaves spatulate lanc Cal spherical 10-striped
6216 Stems erect nearly simple, Lvs lin lower obt Fl very numerous and small, Cal obov clavate 10-striped
6217 Half-shrubby smooth, Stems much branch Lvs lin lanc shortly ciliat numerous, Cal infl clav 10-striped
6218 Stem simple, Lvs lin lanc lower broader stalk Cal clavate cylindr 10-strip Pet 2-part Stam very long
6219 Smooth, Stems erect simple very leafy, Lvs lanc small, Spike dense, Cal clavate netted, Stam very long
6220 Velvety, Radical leaves cochleate smooth, Cal tubular 10-striped, Pet 2-fid, Stamens very long
6221 Pubescent very viscid, Stem simple thick leafy, Leaves large lin lanc wavy, Fl large nodding

§ 4 *Caulescent, Calyx conoid, at the bottom retracted, with very long teeth*

6222 Pubescent, Leaves linear soft, Cal short conical
6223 Stems pubescent, Leaves lanc lin nearly smooth, Cal long conical
6224 Pubescent, Leaves lanceolate wavy the lower stalked, Fl large in loose dichotomous panicles

§ 5 *Caulescent, Flowers spiked, axillary, not opposite, Calyx with 10 stripes.*

* *Calyx cylindrical*

6225 Hairy, Stems branched, Leaves lanc acute, Cal ventricose with very long teeth, Petals small crowned
6226 Very hairy, Stems much branched, Lower leaves obovate spat upper lanc obtuse, Petals undivided
6227 Stems branched, Leaves lin lanc Spike 1-sided, Cal cylindrical with 10 ribs, Teeth long, Pet 3-toothed
6228 Hairy, Stems branched, Lower lvs spatulate upper lanc obtuse, Cal teeth short, Pet obov crowned
6229 Hairy, Stems branched, Leaves spatulate, Spike 1-sided few-fl Cal very hairy, Pet obovate crowned
6230 Hairy, Stem much branched, Leaves lanc cusp Spikes twin dense, Pet small bifid
6231 Stems simple villi Leaves pub lower spatul, upper lanc Spike 2-ranked few-fl Pet obov retuse crowned
6232 Pubesc Stems branch Lvs lanc lower obt Spike 1-sid Cal villi with short teeth, Pet roundish crowned
6233 Stem branch hairy below, Lvs pubesc with a long fringe at base, Cal cyl nearly smooth ribbed and netted
6234 Like the last, but flowers few distant, Petals smaller
6235 Hairy, Stem branched leafy, Leaves lin lanc Flowers terminal, Cal cylindr Pet bifid
6236 Hairy, Fl sessile 1-sided, Cal cylindr appressed, Petals small deeply emarginate

** *Calyx clavate*

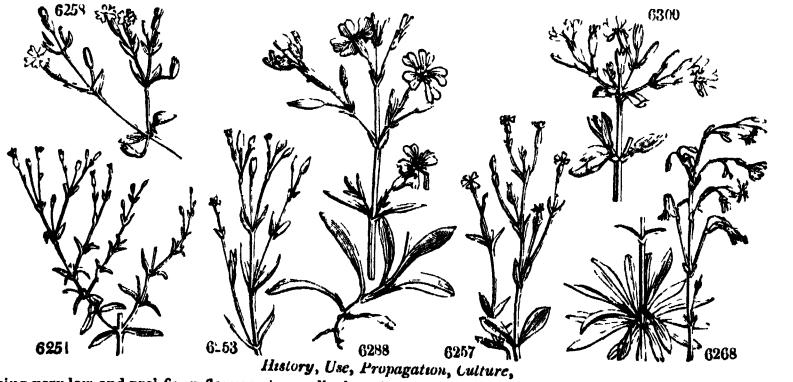
6237 Hoary, Stems prostrate branched, Lvs obovate spatulate ciliated at base, Fl 1-sided erect, Pet bifid
6238 Stems branch pubesc Lvs scabrous ciliat base lower spatul, upper lanc Fl sess nodding, Pet 2-parted
6239 Pubescent, Lvs somewhat fleshy lower spatulate, upper lanceolate, Cal long clavate, Petals 2-fid
6240 Hairy, Stem erect slender branched, Lvs lanc Spikes twin 2-sided, Cal cylindr clavate, Pet bifid
6241 Pubesc Stems branch Lvs spatul obt Spikes twin 1-sided, Cal bladdery, Pet 2-parted with ov lobes
6242 Velvety, Stem procum branch leafy, Lvs ov spatul fleshy, Bract very small, Pet with long claws emarg
6243 Smth Stem erect slend branch Lvs lin scarcely ciliat low ov Fl on long stks Pet 2-part with lin lobes
6244 Smooth, Stems usually simple, Lvs somewhat fleshy lin lanc Cal ov ventric Pet bifid with 4-lob append
6245 Pubesc Stems numerous prostrate very leafy at base, Lvs lin setaceous ciliated, Recesses of calyx deflexed
6246 Pubescent branched supine, Leaves ovate lanc Fl axillary pendulous, Petals bifid crowned

§ 6 *Caulescent, Stems upright, Peduncles filiform, Calyx campanulate or cylindrical*

6247 Tufted, Stems erect slender branched, Lvs small linear very narrow, Fl small, Petals short 4-toothed
6248 Like the last, but the radical leaves broader, Peduncles long upright
6249 Root branched, Stems simple leafy, Lvs lanc lin obt Fl large paniced, Petals broad 4-cleft, Seed ciliated
6250 Smooth, Stems erect branched, Leaves ovate lanc Fl panicled very small, Petals obcordate

and Miscellaneous Particulars.

when about two inches long, and the more they are blanched the better Bryant (*Flora Dietetica*) says, its culture would well reward the gardener's trouble S viscosa is a popular border flower, especially the double variety



S. quinquevulnera was formerly in culture as a border flower, but is now seldom used for that purpose:

History, Use, Propagation, Culture,

being very low and prolific in flowers, it is well adapted for sowing in pots S Armeria is one of the annual border flowers of the seed shops

1049 *Stellaria* The parts of the flower are stellate The species are grassy-looking plants of the easiest

6251 Smooth, Stems erect branched, Lvs lanc. acute: lower obt Petals not opening obcordate, Stam. usually 5
6252 Pubesc. Stem erect much branched slender, Lower lvs. obl obt.: upper lanc. narrow, Pet. short erect bifid
6253 Nearly smooth, Stem erect branched somewhat leafy, Leaves lanc acute ciliated, Fl. small panicled
6254 Pubescent, Stems branched, Lower leaves ellipt spatulate upper lanc Fl term twin, Petals bifid
6255 Pubescent, Stems erect branch. straight, Low lvs. lanc spat up linear, Fl loosely panicled, Pet. 2-lobed
6256 Stems branched, Leaves lin spatulate, Fl term Cal cylindr clavate, Petals 2-fid
6257 Smooth, Stems erect branched, Low lvs ov. stalked obt.: up lin. acute, Fl. loosely panic Cal ov clavate
6258 Viscid pubesc Stems erect much branch. Lvs fleshy low spatul; up ov Fl small, Pet. obcord crowned
6259 Tufted, Stems assurgent, Lvs lin acute, Peduncles very long, Cal long clavate, Petals 2-parted crowned
6260 Tufted shortly bristly, Stems assurgent, Leaves lin. with bristly teeth, Fl small, Petals 2-fid crowned
6261 Smth Stems erect or assurg somew branch leafy at base, Lvs lanc lin acute. low spat. Pet. 2-part naked

§ 7. *Caulescent, Flowers panicled, rarely solitary, Pedicels opposite short, Calyx tubular.*

* *Flowers nodding, Calyxes cylindrical*

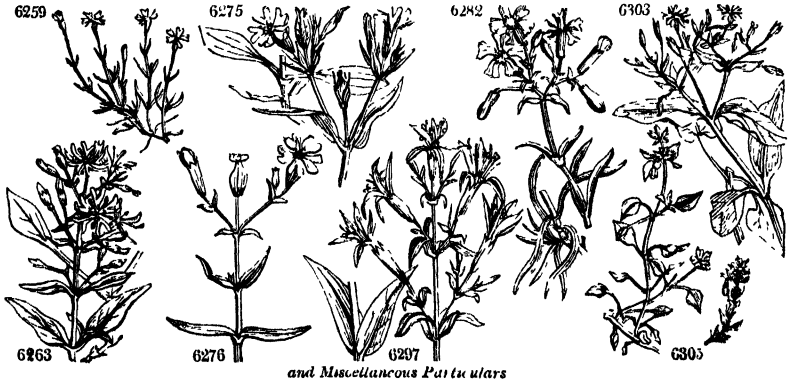
6262 Smooth viscid, Stems erect, Lvs somewhat fleshy lin lanc fringed with fine bristles, Pet very long 2-part. [reflexed
6263 Pubesc Stems leafy at base, Radical lvs spatul upper lanc lin. Pet 2-parted reflexed with a long crown
6264 Like the last, but smooth, less branched, and less leafy, Leaves linear, Petals often green
6265 Like the last, but stems flexuose broken down, Petals white above beneath livid green
6266 Smooth, Leaves lin lanc ciliated at base, Fl pan erect, Cal ventricose cylindr Petals 2-parted
6267 Hairy soft, Stem branch leafy, Lvs large ov acum Fl in large nodding panicles, Pet. with very long claws
6268 Smooth, Stems erect simple scarcely leafy, Petals 2 parted with filiform lobes [crowned

** *Flowers erect, Calyxes clavate*

6269 Velvety glutinous upwards, Stem erect branched leafy, Fl small loosely panicled, Stamens very long
6270 Stem short about 2-flowered pubescent, Radic. leaves lanc lin acute, Cauline very short, Pet bifid
6271 Scarcely pubesc Root long creeping, Stem erect almost simple, Lvs lin grassy acute, Fl few erect panic
6272 Viscid pubesc Stem procumb assurgent branch Fl large panic Cal large clavate, Pet broad bifid crowned
6273 Scarcely pubesc Stem upright branched, Lvs lin lanc Fl panicled erect, Cal netted, Pet small emarginate
6274 Smoothish viscid, Stem erect, Alternate branches long, Cal large clavate netted, Petals bifid
6275 Visc pubes Stems erect branch Lvs large, Fl large panic every other stripe of cal veiny, Teeth very long
6276 Pubes Stems erect branch Lvs lanc obt Fl panic every other stripe of cal veiny, Pet with broad toothl
6277 Subtomentose, Stems branch Lvs obov stalked, Fl term erect, Pet obcord 2-toothed at base [lobes
6278 Silky, Stems branched, Lvs with a long fringe at base, Fl large term Pet 2-parted crowned
6279 Stems much branch scarcely pubesc Lower lvs. obov spatul Lvs lin acute, Cal clavate striped with red
6280 Tufted smooth subviscid, Stems branched at base, Lvs lin Fl panic Cal netted, Pet bifid with lanc lobes

*** *Flowers erect, Calyxes long clavate* [at base

6281 Smooth visc Stems branch Lvs lanc lin Cal very long clav nett Pet obcord with a tooth on each side
6282 Viscid pubescent, Stems procumbent, Leaves lin long, Cal long tubular, Petals slightly emarg crenate
6283 Tufted viscid pubesc Root woody, Stems low assurgent little branched, Cal long netted, Petals bifid
6284 Suffruticose, Stems suberect smooth branched at base, Cal long cylindr viscid-villous, Petals 2-lobed
6285 Scabrous, Stems bran Fl term in the dichotomies, Cal long cylin Pet 2-part tooth on each side at base
6286 Pubescent, Root woody, Stems diffuse branched, Leaves soft numerous below, Petals halt bifid
6287 Tufted viscid pubescent, Stems woody supine branched, Lvs lin acute, Petals with narrow diverging lobes
6288 Stems erect pub Lvs roughish scarcely ciliat Fl large pan Pet. with broad obov lobes & 2-part append
6289 Very smooth glaucous, Stems branched, Leaves roundish acuminate, Fl large, Cal not striped
6290 Pilose pubesc Stems much branch Lower lvs ovate-spatul up lin Fl in large panic Pet 2-lob naked
6291 Pubesc visc Stems erect branch Branch spread Low lvs ov spatul Cal long narrow, Pet ½ bifid crowned
6292 Pubescent, Stems assurgent much branched leafy, Leaves linear acute, Cal clavate, Petals bifid
6293 Stem simple pubescent, Leaves pubescent lower large rounded stalked, Petals 2-parted crowned
6294 Smooth, Stem twiggy, Leaves lin lanc. radical very long, Cal very long, Petals 2-parted crowned
6295 Smooth clammy, Stem assurgent branch Lvs lin lanc acute lower very long, Upper bractes with a broad
6296 Silky, Stems erect branch Lvs wavy, Calyxes long clavate, Pet 2-part crowned [membranous margin
6297 Viscid pubescent, Lvs lanceol Cal long tubular, Petals lanceolate crowned, Stamens very long
6298 Villous viscid, Lvs lin lanceol obt ciliated, Peduncle 1-fl spreading in seed, Cal. circularly reflexed at base



§ 8 *Caulescent, Flowers corymbose, Cal clavate, 10-striped*

6299 Tufted roughish, Root thick woody branch Stems simple slender very leafy at base, Lvs small lin acute
6300 Viscid, Stem much branch pubesc Lvs round subcihated the lower on long stalks, Fl loosely corymb

6301 Very smooth glaucous viscid, Leaves ovate-lanc Fl in panicled corymbs, Petals obcordate crowned

6302 Smooth, Stems erect branched, Upper leaves lanceolate lower linear lanc Umbel dense, Petals obovate

6303 Lower leaves cordate stalked upper lanc sessile, Petals twice as long as calyx
6304 Stems diffuse dichotomous rooting at base, Lower lvs ovate stalked cord upper sess Pet shorter than cal.
6305 Stems procumbent with a lateral 1-sided hairy line, Leaves lanc very tender, Fruit deflexed

and Miscellaneous Particulars

culture S media is a well known weed, never found but on rich friable soils in a state of culture the seeds and flower buds are a favorite food of finches and other small birds.

History, Use, Propagation, Culture,

1050 *Arenaria* From *arena*, sand, in which most of the species are found They are of most difficult discrimination, and are chiefly diminutive weeds found almost exclusively on sandy soils The flowers vary

6306 Hairy, Lvs cord ovate stem-clasping, Stem dichotomous, Fl solitary, Sepals lanc ac longer than petals
6307 Leaves ovate lanceol nearly veinless, Pedunc 1-fl Sepals lanc acute twice as short as petals
6308 Villous viscid, Leaves lin lanc Stems dichotomous diffuse, Petals and capsule longer than calyx
6309 Lvs lanc acum serrulate roughish the upper broader and shorter, Pedunc filiform very long, Pet 2-fid
6310 Stem erect few-fl Lvs linear acute entire smoothish, Pedunc filiform very long, Petals 2-parted
6311 Leaves linear smooth at edge, Stems diffuse, Fl panicled divaricating, Petals the length of calyx
6312 Glaucous, Leaves lin lanc smooth at edge, Floral scarious, Petals twice as long as cal Stem erect weak
6313 Leaves ovate-lanceol entire smooth thick, Sepals ovate-lanceol much shorter than petals
6314 Leaves ovate-obl Pet deeply divided shorter than calyx, Caps ovate oblong longer than calyx
6315 Leaves obl pubescent, Pedunc 1-fl twin, Pet larger than cal Caps obl nearly twice as long as sepals
6316 Leaves spatulate, Stem erect bifid viscid, Branches alternate, Petals emarginate
6317 Leaves linear lanc obtuse very dense, Pedunc 1-fl and umbelled, Pet scarcely longer than calyx
6318 Leaves lanc entire sessile acute, Base and stem pubescent, Fl axill solitary
6319 Glandular pubescent, Stem procumbent, Leaves ovate fleshy, Petals scarcely longer than calyx cut
6320 Very smooth, Leaves linear-lanc Pedunc terminal dichotomous bracted, Pet broad obovate 2-parted

§ 1 *Caps 3-valved, Leaves linear, with scarious stipules at base*

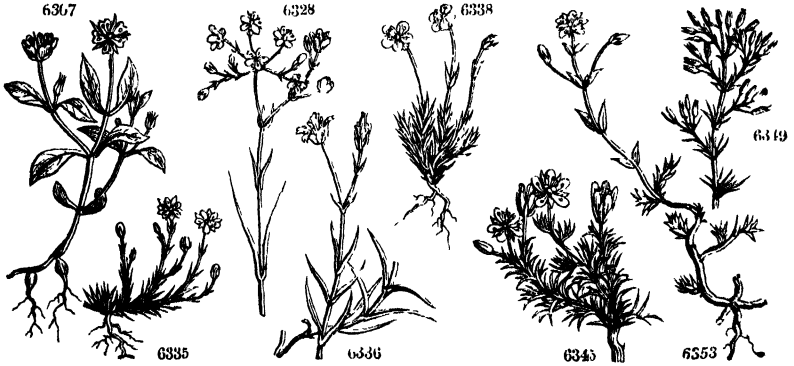
6321 Smooth, Stem erect, Leaves subulate 1-sided, Petals shorter than calyx
6322 Hispid, Stem erect, Branches divaricating, Lvs setaceous twice as short as joints, Pet. obt shorter than calyx
6323 Stems prostrate hairy, Leaves filiform shorter than the joint, Sepals lanceolate obtuse scarious at edge
6324 Like the last, but nearly smooth
6325 Stems prostrate, Leaves half cylindrical fleshy as long as joints, Seeds with a membranous wing
6326 Pilose subhispid, Leaves filiform longer than joint, Stamens 5, Seeds obcord compressed, Caps globose

§ 2 *Leaves grassy, linear, lanceolate or rounded, without stipules, Caps 3-valved*

* *Leaves grassy*

6327 Stems erect simple, Lvs subul. filiform rough, Panic trichotomous pubescent lax, Calyxes very obtuse
6328 Leaves subulate-filiform serrulate, Stems erect simple Panicle trichotomous smooth compact
6329 Leaves lin setaceous ciliated rough, Stems erect rigid simple, Sepals acute scarcely longer than corolla
6330 Stems ascending few-fl pubescent, Lvs setaceous rigid, Culine straight, Sepals obtuse striated villous
6331 Leaves setaceous rigid mucronate striated, Stems panicled few-fl Sepals lanc much shorter than corolla

** *Leaves subulate or linear*



6332 Lvs subulate rigid spiny: lower fascicled, upper distant, Stems erect firm, Pet obov twice as long as cal
6333 Erect smooth many-stemmed, Leaves subulate linear erect, Pan few fl Petals conspicuously striated
6334 Leaves subulate tooth-ciliated, Stems ascending 3-6-fl roughish, Cal cylindrical, Sepals 3-nerved hairy

6335 Like the last, but stems rigid few-fl Leaves long straight, Pedunc and calyx viscid hairy
6336 Lvs lin subul 3-nerved, Stem panicled, Pedunc terminal very long twin downy, Pet obt emarginate
6337 Like the last, but stems 2-4-fl Leaves narrow recurved
6338 Lvs subulate broadish flat 3-nerved ciliated, Radical clustered, Stems 1-fl Pedunc very long pubescent
6339 Tufted many-stemmed, Leaves subulate obtuse nerved, Stems panicled elongated
6340 Erect branched, Leaves linear subulate 3-nerved, Pedunc twin terminal 1-flowered
6341 Leaves subulate, Stems panicled, Sepals ovate
6342 Stems filiform rooting very long diffuse, Flowering branches erect few-fl Lvs lin flat acute fascicled
6343 Leaves subulate setaceous, Stem branched dichotomous, Sepals subulate striated much longer than petals
6344 Stem much branched, Leaves lin recurved, Sepals with a long point and membranous edge
6345 Radical lvs clustered recurved subul 1-sided, Stems tufted simple 2-fl Sepals and peduncles hairy gland
6346 Stem much branched, Fl panicled fastigiate, Leaves setaceous fascicled 1-sided ciliated at base
6347 Leaves subulate fascicled setaceous, Stems erect straight simple, Sepals acuminate with 2 lines
6348 Leaves setaceous fascicled with 2 stripes, Stems suffruticose dichotomous, Pedunc term 1-2-flowered
6349 Lvs setaceous not ciliated at base, Stems tufted prostrate at base, Pedunc longer than leaf, Sepals awned

6350 Procumbent, Leaves linear obt Peduncles 2 or 3 1-flowered with 2 bractes at base, Sepals without nerves
6351 Leaves subulate rigid spiny and flowers whorled, Pedunc 4-fl capitate

*** *Leaves lanceolate, oval or rounded*

6352 Leaves ovate carinate recurved edged imbricated 4 ways, Stems straight downy, Sepals rigid acute keeled
6353 Tufted villous, Branches ascending, Leaves lanceolate narrow acute rigid nerved
6354 Like the last, but smaller, with creeping and tufted stems, and imbricated leaves
6355 Pubescent, Leaves lanc linear, Barren stems very long procumbent, Pedunc terminal long 1-flowered
6356 Leaves ovate acute sessile regular ciliated and smooth, Sepals lanceolate 3-nerved acute green opaque
6357 Pubescent, Lvs ovate acute stalked, Stems spreading branched elongated, Sepals acute shorter than cor
6358 Leaves oblong acute 3-nerved ciliated imbricated, Stem prostrate, Sepals lanceolate acuminate striped
6359 Leaves lanc acute spreading hard rough, Stem simple short, Sepals ovate acuminate striped
6360 Leaves ovate and obovate blistered rugose more or less nerved and ciliated, Stems procumbent
6361 Like the last, but leaves pulpy thick and sepals scarcely nerved
6362 Stem slender branched, Lvs ovate acute stalked ciliated nerved, Pedunc long bent down after flowering

and Miscellaneous Particulars

considerably in the number of their stamens, more generally falling short of than exceeding the regular number.

History, Use, Propagation, Culture,

1051 *Cherleria.* John Henry Cherler was an assistant of John Bauhin in preparing his Historia Plantarum. A little obscure weed

1052 *Brunnichia* A catalogue of the books upon natural history was published by one Mr. F. Brunnich, a Danish naturalist, in 1793

1053 *Garidella* So named by Tournefort, in honor of Pierre Garidel, M D., physician at Aix in Provence, author of Histoire des Plantes qui naissent en Provence, 1719, with many figures. A plant of little curiosity or beauty Small inconspicuous plants of the easiest management

1054 *Malpighia* So named by Plumier in honor of Marcello Malpighi, professor of medicine at Bologna, author of Anatome Plantarum, 1765 and 1769, a celebrated work, the best of its time on the structure of vegetables. The species are handsome evergreen trees and shrubs, some of them fruit-bearing and others climbers M glabra is grown for its fruit in the West Indies, and the fruit of M urens is also eaten under the name of Barbadoes cherry, but that of both species is much inferior to European cherries. All the species have the under sides of their leaves covered with prickly bristles which when handled run into the fingers. Ripened cuttings root freely in sand under cover

1055 *Banisteria* So named by Dr Houstoun, in memory of the Rev. John Banister, a curious botanist, who lost his life in search after plants in Virginia The species are chiefly evergreen climbers and twiners, some of them, as B fulgens and chrysophylla, have fine shewy foliage as well as beautiful flowers.

6363 Tufted creeping, Leaves ovate shining fleshy ciliated, Pedunc long 1-fl. Flowers cernuous
6364 Leaves ovate acute fleshy approximated, Fl solitary on short stalks, Sepals obl acute as long as cor.
6365 All over pubescent, Leaves lin. lanceol. Stems prostrate much branched, Seeds very minute

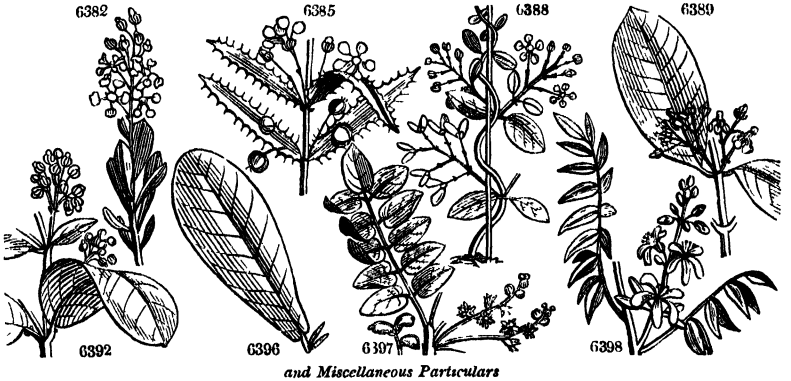
6366 Leaves spreading

6367 Leaves cordate sagittate

6368 Petals sessile spreading, Stamens 10-12

6369 Leaves ovate entire smooth, Peduncles umbelled
6370 Leaves ovate entire smooth, Peduncles 1-flowered
6371 Leaves entire oblong acute smooth shining with 2 glands beneath at the base
6372 Leaves entire oblong lanceolate acute smooth with 2 glands at a distance from the base
6373 Leaves ovate nearly entire with hairs on both sides, Fl -stalks with a truncate gland at top
6374 Leaves ovate elliptical acuminate entire smooth with 2 glands at base
6375 Leaves oblong acuminate entire smooth, Racemes axillary, Fl monogynous
6376 Leaves elliptical shining hairy beneath, Fl axillary corymbose

6377 Leaves obl ovate with decumbent stiff bristles, Peduncles 1-fl aggregate
6378 Leaves lin lanceol with decumbent bristles on each side, Peduncles umbelled
6379 Leaves obl obtuse pubescent, Racemes axillary compound
6380 Leaves ovate entire obtuse downy beneath, Racemes terminal
6381 Leaves ovate downy beneath acute, Flowers yellow spiked
6382 Leaves obovate wedge-shaped entire veinless shining, Raceme terminal
6383 Leaves ovate acute entire smooth on each side, Racemes terminal spiked
6384 Leaves oval acuminate shining, Racemes corymbose terminal
6385 Leaves lanceol. toothed-spiny hispid beneath
6386 Leaves subovate toothed-spiny



6387 Leaves orbicular cordate ciliate toothletted smooth, Petioles with 2 glands
6388 Leaves roundish ovate obtuse smooth, Racemes axillary and terminal, Seeds erect
6389 Leaves ovate oblong acutish towards the end obsoletely ciliated beneath shining gold-colored
6390 Leaves ovate-oblong rigid, Racemes terminal
6391 Leaves ovate oblong entire beneath shining, Panicle terminal leafy
6392 Branches 2-edged, Leaves ovate downy beneath, Petioles with 2 glands
6393 Leaves subovate downy beneath, Racemes brachiate, Peduncles umbelled
6394 Leaves downy beneath orbicular cordate, Branches divaricating roundish, Petioles with 2 glands
6395 Leaves subovate, Branches brachiate, Seeds narrower inwards

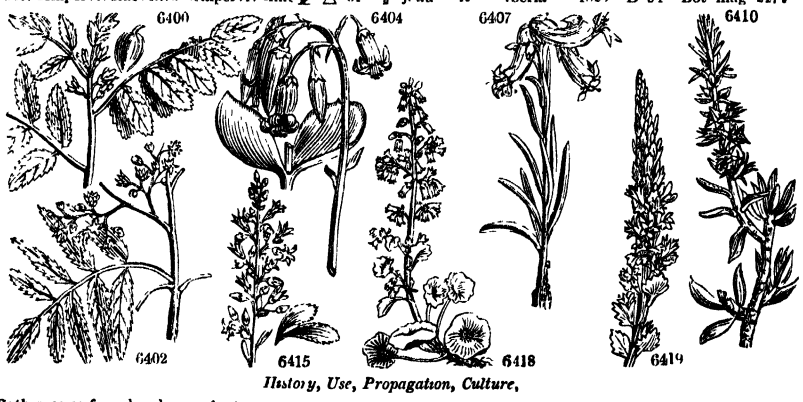
6396 Leaves simple obovate obtuse pubescent above smooth beneath

6397 Leaves pinnated, Leaflets ovate stalked smooth on each side, Racemes fascicled

PENTAGYNIA.

6398 Leaves pinnated, Leaflets ovate-lanceolate, Fruit oblong with obtuse angles
6399 Leaflets ovate unequal acuminate, Fruit obl acute-angled

and Miscellaneous Particulars



All of them root freely in ripened wood in sand under a hand-glass In most respects they resemble the last genus

1056. *Hiræa* Named after John Nicholas de la Hire, a French physician, who died in 1727. Plants with the appearance of Banisteria.

1057 *Cnestis* From κνηθω, to scratch The capsules, covered with hairs, excite a troublesome itching Fine evergreen stove shrubs.

1058. *Averrhoa* So named in honor of Ebn Elvelid Ebn Rushad, commonly called Averrhoes, of Corduba in Spain, a famous commentator on Aristotle and Avicenna He also published Calliget, or the plants used in food, &c He died at the beginning of the thirteenth century The specific names are vernacular appellations The species are evergreen trees, singular for the fruit growing frequently on the trunk itself, below the leaves the flowers grow in racemes, the fruit is a five-celled pome. A Bilimbi is a beautiful tree with a green fleshy oblong fruit the thickness of the finger, filled with a grateful acid juice, the substance and seeds not unlike those of cucumber They make a syrup of the juice, and a conserve of the flowers, which are esteemed excellent in fevers and bilious disorders A carambola bears a fruit the size of a hen's egg, with a pulpy subacid juice, used ripe and also pickled green, and employed also in dying, and other economical purposes The petioles and branches of this tree are said to have a peculiar sensitive quality, of which an account is given by Dr Bruce in the Philosophical Transactions,

History, Use, Propagation, Culture,

Both species form handsome plants in our stoves, they grow freely, and ripened cuttings root readily in sand under a hand glass

1059 *Spondias* One of the Greek names of the plum The plants of this genus bear fruit like plums, which are also called hog plums in the West Indies These are deciduous fruit-bearing trees, natives or cultivated in both Indies S Mombin (the South American name) flowers from the sides of the branches, and is known by its oblong or ovate fruit like a plum, having a luscious thin pulp covering a large fibrous stone. The skin is yellow, purple, or variegated, the pulp is yellow and thin, having a singular but not unpleasant taste, and a sweet smell The seed scarcely ever ripens, but it is so easily increased by cuttings, that if a branch laden with young fruit be set in the ground, it will grow, and the fruit will soon come to maturity In St. Domingo they make hedges of the boughs, which flower and bear fruit in a few months. It is also cultivated for the sake of the fruit, though it is not in much esteem in Jamaica

The flowers of S Myrobalanus (the Myrobalanus of Dioscorides was an Egyptian or Arabian tree, which

6400 Common petiole compressed
6401 Common petiole round, Leaves shining acuminate
6402 Common petiole round with 6 pairs of leaflets which are serrated and ribbed

6403 Leaves orbicular spatulate powdery obtuse with a point, Fl panicled, Stem erect branched
6404 Leaves ovate spatulate obtuse powdery with a point edged with red, Fl panicled, Stem erect branched
6405 Leaves opp rounded ovate, Flowers corymbose
6406 Leaves obl spatulate obtuse smooth with a point, Fl panicled, Stem erect branched
6407 Leaves semicylindrical scattered, Fl panicled nodding, Tube curved
6408 Leaves ovate spatulate obtuse with a point powdery, Fl panicled, Stem much branched divaricating
6409 Leaves wedge-shaped fascicled, Stem thickened, Branches fleshy conical
6410 Leaves obovate acute fleshy, Spike leafy terminal
6411 Leaves crossing rounded mucronate glaucous, Fl panicled pendulous
6412 Leaves half orbicular scurfy dotted flat above, Fl few small sessile
6413 Leaves spatulate obtuse naked with a point
6414 Leaves glaucous narrow tongue-shaped at the end obcuneate mucronate, Fl cymose, Stem leafy

6415 Leaves oval crenate, Stem spiked
6416 Leaves oblong nearly round, Flowers fascicled
6417 Leaves lanceolate acute fleshy, Spike cylindrical terminal leafless
6418 Leaves peltate crenate, Stem nearly simple, Fl pendulous, Bractes entire

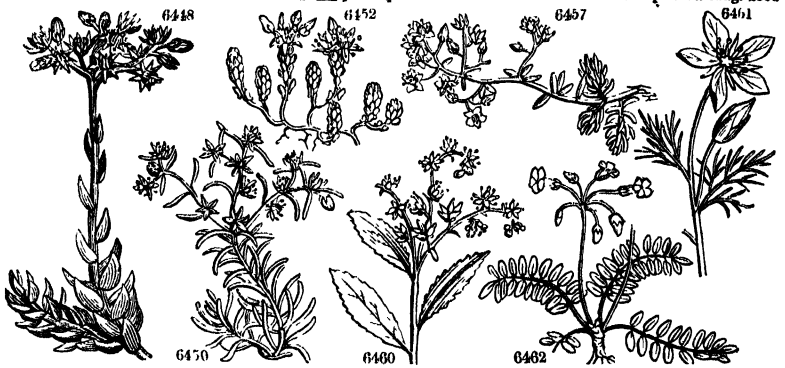
6419 Leaves peltate crenate, Stem nearly simple, Flowers erect, Bractes toothed

6420 Leaves whorled 4

6421 Leaves amplexicaul cordate ovate obtuse unequally and deeply serrated
6422 Leaves amplexicaul cordate oblong obtusely serrated whitish
6423 Leaves flattish serrated, Corymb leafy, Stem erect
6424 Leaves flat ovate acute at each end toothed, Flowers in corymbose fascicles
6425 Leaves wedge-shaped narrowed at the base subsessile, Stems decumbent, Fl corymbose
6426 Leaves wedge-shaped rhomboid emarginate stalked, Stems branched, Pan terin divaricating
6427 Leaves lanceolate serrated flat, Stem erect, Cyme sessile terminal
6428 Leaves roundish obovate flat crenated at end with a cartilaginous muricated edge
6429 Leaves flat opposite spatulate toothed
6430 Leaves wedge-shaped concave somewhat toothed aggregate, Branches creeping, Cyme terminal
6431 Leaves flat cordate toothed stalked, Corymbs terminal
6432 Leaves whorled obovate entire smooth, Cyme in three divisions
6433 Leaves flattish angular, Fl lateral subsessile solitary
6434 Stems branched, Leaves entire lower spatulate, Stigmas acute
6435 Leaves flat lanceolate, Stem branched, Flowers panicled, Petals acute awned
6436 Radical leaves obovate with a long mucronate point, Stem simple, Spike term long

6437 Leaves opposite ovate obtuse fleshy, Stem weak, Fl scattered
6438 Leaves subulate scattered separate at base the lower recurved
6439 Leaves glaucous subulate scattered separate at base, Fl cymose, Cal lanceolate
6440 Lvs rounded subulate acute those of the barren branches glaucous spreading, Branches of cyme recurved
6441 Lvs rounded subulate acute those of the barren branches glaucous spreading, Branches of cyme compact
6442 Leaves subulate in 7 rows glaucous very close distinct at base [erect
6443 Leaves subulate scattered separate at base, Fl in cymes Petals half as long as lanceolate calyx
6444 Leaves subulate scattered separate at base glaucous, Fl in cymes, Petals twice as long as calyx
6445 Leaves subulate spreading in many rows close, Cal short obtuse
6446 Leaves oblong alternate obtuse separate at base, Cyme bifid smooth
6447 Leaves flat spatulate ovate acute entire pubescent, Corymb hemispherical

and Miscellaneous Particulars



bore a perfumed fleshy fruit Jacquin applied the name to this South American plant, which is nearly similar in properties) come out before the leaves make their appearance, and are succeeded by yellow plums the size of a pigeon's egg, which are eaten by children, and considered excellent food for hogs It grows by large cuttings as freely as the other S aulosis a handsome tree, the pulp of the fruit is firmer than that of the others, and tastes like a Remette apple It is cultivated in the Society and Friendly islands, especially in Otaheite, the fruit is of a gold color, hangs in little nodding bunches, and is esteemed both tasteful and wholesome its flavor resembles that of the pine-apple

1060 *Cotyledon* From κοτυλη, a vessel or cup Many of the species of this genus have cup-shaped leaves The species are succulents of little beauty, and of the easiest culture in light earth and lime rubbish, or in sand and loam

1061. *Sedum* From *sedere*, to sit these plants growing upon the bare rock, look as if sitting upon it The species are low succulents, some of them pretty, others curious, but none of them remarkable in any way.

History, Use, Propagation, Culture.

They seem destined by nature to clothe rocks and dry arid places, after a certain portion of vegetable soil has been generated by lichens and mosses

Orpine is the French name of two or three species S album is said to have the same virtues as used to be attributed to the houseleek, Sempervivum tectorum it is pickled by some in the manner of samphire S acre is considered antiscorbutic, its juice applied to the skin blisters it, taken inwardly it vomits, and applied externally to gangrenes promotes suppuration

1062 *Penthorum* From πεντε, five, in allusion to the five-marked angles of the capsules. Succulent North American plants of no beauty whatever

1063 *Grielum* A small uninteresting Cape plant, with yellow flowers and hoary leaves like southernwood. Derived from γεριος, old, in allusion to its hoary aspect

1064. *Biophytum.* Βιος φυτον, plant of life, in allusion to the lively irritable nature of the foliage This genus, the Oxalis sensitiva of Jacquin, has been lately divided by M De Candolle from Oxalis, chiefly on

6448 Petals 8, Leaves scattered · the lower rounded, upper depressed

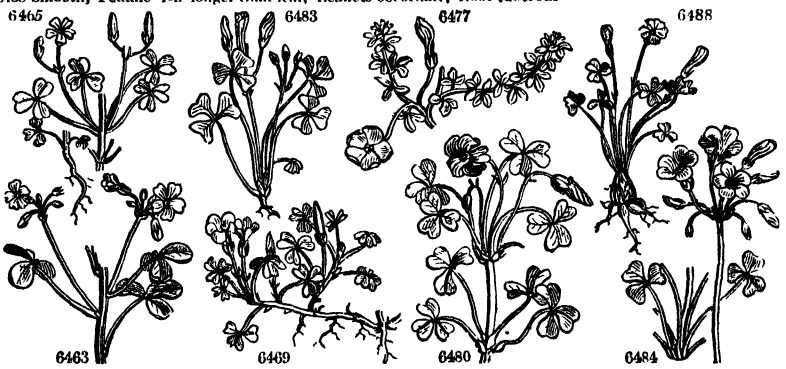
6449 Leaves scattered rounded obtuse, Stem simple, Fl in umbels with 4 petals
6450 Leaves linear rounded depressed scattered, Cyme open, Petals 4
6451 Leaves oblong obtuse roundish sessile spreading, Cyme branched
6452 Leaves subovate adnate-sessile gibbous nearly erect alternate, Cyme trifid
6453 Leaves subovate adnate-sessile gibbous nearly erect imbricated six ways
6454 Leaves subovate adnate-sessile gibbous alternate, Cyme branched bifid
6455 Stem erect solitary annual, Leaves ovate sessile gibbous alternate, Cyme recurved
6456 Leaves oblong flattish above and peduncles axillary about 1-fl pubescent, Petals ovate obtuse
6457 Leaves whorled linear, Stem procumbent panicled, Peduncles villous viscid
6458 Stem erect, Flowers corymbose fastigiate
6459 Leaves scattered oblong-cylindrical obtuse, Stems shrubby much branched, Cymes terminal

6460 The only species

6461 Peduncles simple 1-fl. *Leaves* tripartite multifid linear downy

6462 Peduncles many-fl at end

§ 1 *Peduncles many-flowered, Stems suffruticose, Cells of ovary usually* 1 *seeded*
6463 Stem erect leafy, Umbel 4-fl the length of leaves, Leaflets entire ovate obtuse



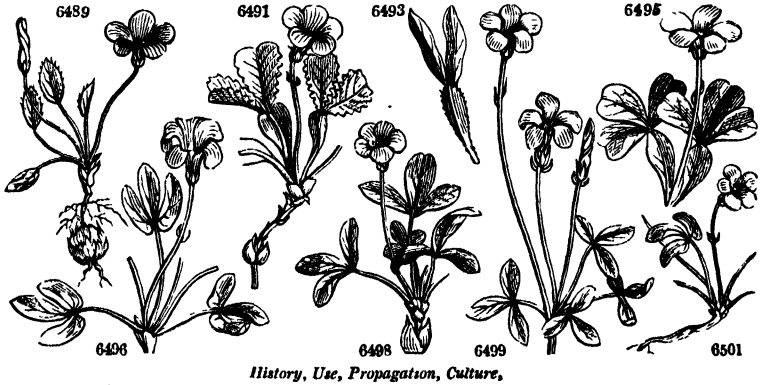
§ 2 *Caulescent, Leaves palmate* 3-*foliate, Leaflets all sessile, obcordate*
6464 Peduncle 2-3-fl somewhat longer than leaf-st Lvs 2-lobed obcord ciliated, Styles a little longer than inner
6465 Stem hairy, Umb 5-6-fl longer than leaves, Lvs obcordate, Styles longer than both stamens [stamens
β Stem decumbent, Peduncles 2 or 3-flowered
6466 Stem erect, Umbels 2-6-fl about as long as leaves, Leafl obcord Styles the length of inner stamens
6467 Stem rooting, Peduncles shorter than leafst Leafl obcordate, Styles the length of inner stamens
6468 Smoothish, Peduncle 2-fl longer than leafst Leafl 2-lobed, Styles the length of inner stamens

6469 Stem rooting, Peduncle 2-fl the length of leafst Leaflets obcordate, Styles middling
6470 Stem erect, Peduncle axill four times as long as leaf at the end corymbose racemose, Leafl obcordate
6471 Stem naked at base, Peduncle lateral umbell at end, Leafl cun emarg Styles shorter than outer stamens

§ 3 *Caulescent, Leaves sessile,* 3-*leaved, villous, not glandular, Peduncle axillary,* 1-*flowered*
6472 Stem branch Ped. much long than lvs Bractes next cal Leafl lin emarg Styles long than inner stam
6473 Ped 4 times as long as lvs Bractes appressed to cal Leafl lin cun obt Styles shorter than outer stamens
6474 Stem declined, Branches 1-sided, Leafl lin -cuneiform, Peduncles scarcely longer than leaves
6475 Leafl lin cun ret. Ped much long than lvs Bractes remote from cal Stam with neither teeth nor glands
6476 Stem much branched, Leafl lin cuneate obt Peduncle much shorter than lvs Bractes remote from cal
6477 Leafl lin cuneate, Peduncle much longer than leaves, Bractes remote from cal Styles intermediate
6478 Leafl obl cuneiform, Peduncle much longer than leaves, Bractes remote from cal Styles intermediate

§ 4 *Caulescent, sparingly leafy, Leaves stalked,* 3-5-*leaved, Peduncle axill* 1-*flowered*
6479 Stem short, Leaves on long stalks, Leafl 3 ovate-rounded, Styles very short
6480 Stem branched, Leaves stalked in fascicled whorls with 3 obcordate leaflets, Styles very long

§ 5. *Stemless, Peduncle* 1-2 *or many-flowered, Leaves radical, many-leaved, usually* 3-*leaved*
6481 Leafl 3 obcordate silky, Umbel longer than leaves, Fl nodding, Styles intermediate
6482 Leafl 3 obcordate smooth, Umb 3-9 fl Styles very short, Fl nodding
6483 Leafl. 3 obcordate 2-lobed smooth, Umb 2-4-fl Flowers erect, Styles very short
6484 Leafl 3 obcordate 2-lobed smooth subciliated, Umb many-fl Fl drooping, Styles very short
6485 Petiole flattish, Leafl 3 obcordate pubescent, Umb 2-fl Sepals entire, Styles very long
6486 Leafl. 3 obcordate smooth subciliate, Umb 2-5-fl Sepals 3-toothed at end, Styles very long
6487 Leafl 3 obcordate 2-parted beneath violet, Umbel 2-fl Styles middling
6488 Smooth, Peduncle 1-fl longer than leaf, Leaflets obcordate, Root tuberous



and Miscellaneous Particulars

account of its irritable pinnated foliage, and its stamens being distinct, and five of them only being perfect It is a very pretty annual, and if well managed so as to acquire, as in China, a stem six or nine inches high, is quite a remarkable object Cultivated in common earth, and propagated by seeds, which it produces in abundance

1065. *Oxalis* The Oxalis of the ancients, which was named from ὀξυς, sharp, or sour, was a very different plant from this, which is thought to have been the Oxys of Pliny The name employed by Linnæus has, however, been adopted by his followers, although Clusius, Ray, Plumier, Tournefort, Haller, and others, called the genus Oxys

This is a tribe of pretty little plants, of which most of the species flower freely, but all of them are without their leaves half the year The root is commonly bulbous; in some species only thick and fleshy, in a few branched the bulbs consist of fleshy scales, sometimes closely imbricate, sometimes loose and diverging In a few the subterraneous stipe and the terminating fibre of the bulb produce little dog-toothed bulbs, in such

History, Use, Propagation, Culture,

abundance as to fill the whole pot to the very bottom, as in purpurea, cernua, reptatrix Sometimes the bulb strikes very deep, as in tomentosa, the original bulb near the surface striking a radical fibre downright from its base, which puts out from its side a new bulb, producing the next year's plant, whilst the former perishes. Sometimes fusiform, thick and long fibres spring in a monstrous form from the bulbs, as in glandulosa and some others Some of the species have a proper stem (*Caulis*), when it bears all the leaves and peduncles alternately, and not in a terminating umbel this is either branched or quite simple, and that for the most part inconstantly Others have a stipe, the leaves and flowers being aggregate together at the end of the stalk, this bears none or very few leaves along it, seldom many. In some species the stipe is always subterraneous, as in breviscapa, purpurea, &c.; in others it is always above ground, as in gracilis, versicolor, tenuifolia. Stipes are commonly quite simple, some, however, are branched, the branches terminating in umbels, as in incarnata and polyphylla. Hence the division of the species into caulescent and stipitate The leaves are not, perhaps, truly sessile in any of the species, they are subsessile in a few, but in most are petioled They are simple in three species, binate in four, digitate in six, in the rest ternate. almost all of them have an acid

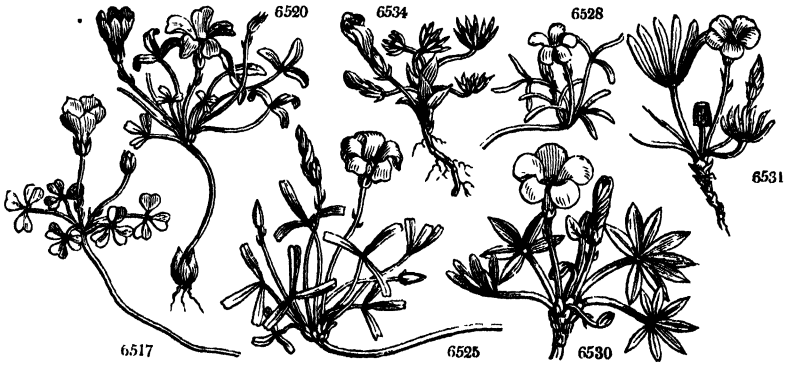
§ 6. *Stemless, Leaves simple.*

6489 Leaves ellipt. obtuse, Scape 1-fl Filam smooth, Styles middling covered with glandular hairs
6490 Leaves obovate retuse, Scape 1-fl. Styles very short, Filaments glandular

§ 7 *Stemless, Leaves 2 or 3-leaved, Stalks winged.*

6491 Leafl 2 roundish obovate emarginate wavy at edges Styles very long and filaments glandular
6492 Leafl. 2 ellipt emarg. with a cartilaginous toothletted edge, Filam glandular
6493 Leafl 2 lanceolate with a cartilaginous toothletted edge, Filam. glandular
6494 Leafl 2-3 with a cartilaginous scabrous edge, Filam smooth
6495 Leafl. 3 obovate emarg mucronate, Styles and filaments glandular

§ 8. *Stemless, Leaves stalked, 3-leaved, Stalks not winged.*



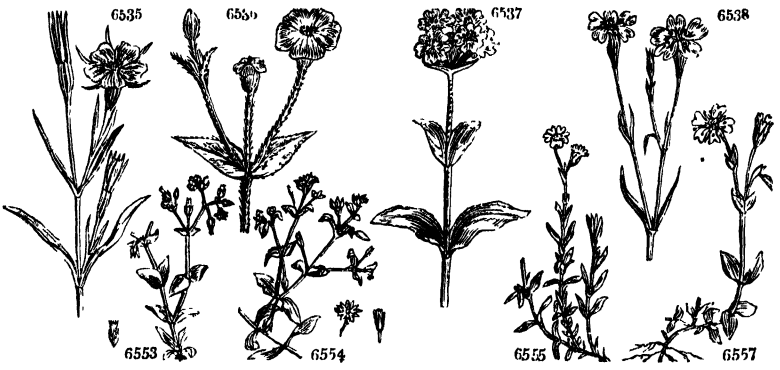
6496 Pubescent, Lateral leaflets obliquely oblong middle lanceolate, Scapes higher than petioles
6497 Pubescent, Leafl obl. obt. middle cuneate at base, Scapes length of petiole
6498 Pubescent, Leafl. obl obt. middle subcuneate, Scapes longer than petiole
6499 Pubesc. Leafl obl obt. submarg Peduncs longer than petiole with 2 bractes immediately below the cal.
6500 Pubescent, Leafl obl. emarg Peduncs length of petiole with 2 bractes immediately below the cal
6501 Pubescent, Leafl obl. retuse middle cuneate, Peduncles twice as long as leaves with 2 bractes in middle
6502 Subhirsute, Leafl obov obl. obt Peduncs equal to petiole with 2 bractes in their middle, Styles glandular
6503 Subhirsute, Leafl obov obl obt Ped. longer than petioles with 2 bractes below their middle, Styles hairy
6504 Pubesc. Leafl obt. lateral ovate midd cuneate, Peduncs twice as long as petiole with 2 bractes in midd
6505 Pubesc. Leafl roundish, Peduncs. as long as pet with 2 bractes at base, Calyx with clavate hairs at edges
6506 Pub Leafl roundish, Ped. as long as pet. with 2 bractes below mid Cal with simple and glan hairs mixed
6507 Pub Leafl round mid cun at base, Ped as long as lvs or long with 2 bractes below mid. Styles very short
β Flowers large, Leaves red beneath
γ Flowers large, Leaves green on both sides
6508 Pubesc Leafl roundish, Scapes longer than leaf with 2 bractes below the middle
6509 Smooth, Leafl roundish dotted, Stipules dilated acuminate, Bractes alternate
6510 Pub. Leafl. obcor. roundish, Scapes nearly twice as short as pet. with 2 bractes in mid Styles intermediate
6511 Pub Leafl. obcor roundish, Scapes thrice as short as petiole with 2 bractes in midd Styles very long
6512 Densely pubesc. Leafl obcordate, Scape longer than leaves with 2 bractes above middle, Cal. obtuse
6513 Woolly, Leafl. obcordate, Cal. acute
6514 Root toothed creeping, Leafl obcord downy, Scape longer than leaves, Petals oval obtuse
6515 Root toothed creeping, Leafl obcord downy, Scape longer than leaves, Pet obl unequally emarginate
6516 Smoothish, Leaflets obcordate, Scape longer than the leaves, Styles very short
6517 Leaflets obcordate smooth, Peduncs the length of leaves, Styles very short
6518 Leafl obcord 2-lobed, smooth, Peduncs longer than leaf, Styles intermediate
6519 Leafl obcord 2-lobed smooth, Peduncs longer than leaf, Styles very long
6520 Leafl cuneate emarg. hairy, Peduncs the length of petiole, Styles very short, Filam glandular
6521 Leafl lin emarg downy, Peduncs shorter than petiole with 2 bractes at summit, Styles very long
6522 Leaflets linear subcuneate emarginate, Peduncs. as long as petiole, Style intermediate

§ 9. *Leaves 3 or 5-leaved, glandular at end*

6523 Leaflets 3 linear cuneiform emarginate dilated with many glands beneath
6524 Leaflets 3 linear emarginate with 2 glands beneath, Styles and filaments glandular
6525 Leaflets 3 linear emarginate with 2 calli at end, Styles very short
6526 Leaflets 3 linear emarginate with many glands beneath, Styles very short, Inner filaments glandular
6527 Leaflets 3 linear emarginate with 2 glands beneath, Styles intermediate and filaments glandular
6528 Leaflets 3 linear entire at end and glandular, Styles very long and inner filaments glandular
6529 Leaflets 5 linear at the end nearly entire with 2 callous glands, Styles intermediate

§ 10 *Leaves palmate or peltate, many-leaved, not glandular at end.*

6530 Leaflets 7 lanceolate acutish smooth spotted at base, Petioles compressed, Styles very short
6531 Leaflets 6-7 smooth linear channelled acute, Styles very short, Filam glandular
6532 Leaflets 7 smooth lin lanc obtuse, Cal appressed, Styles very long and filaments glandular
6533 Leaflets 7-9 smooth lin emarg Cal reflexed at end, Styles intermediate
6534 Leaflets 9-19 all over downy lanceolate cuneate emarginate



and Miscellaneous Particulars

taste, whence their names of Oxalis or Oxys, wood Sorrel, &c The partial stem bearing the flower is a peduncle in the caulescent, a scape in the stipitate species.

Many of the species ripen seeds, from which, or from offsets, they are readily propagated, and grown in light sandy soil · care being taken to give the pots little or no water when the plants are in a dormant state An excellent work has been written on the genus by Jacquin, in which ninety-six species are described. All that were known in Europe at that time, were cultivated in the Imperial gardens of Schönbrunn with great success, under the immediate inspection of Jacquin, by whom the following directions are given for their management They are best kept in pots which will hold a good many roots. The earth should be so light and sandy as never to become hard, but always to be soft enough not to resist the point of the finger when pressed upon it, when the flowering time is passed, the pots should be placed aside, where they require neither care nor water, but are well protected from mice In the beginning of August they should be placed in the open air and moderately watered. About the end of that month, or a little later, the leaves should appear About the middle of September, earlier or later, according to the weather, they should be placed in a very sunny, airy greenhouse,

History, Use, Propagation, Culture,

when they will flower well Oxalis monophylla and rostrata will not, however, blossom unless placed in a very hot stove

O Acetosella, *la petite oseille* or *surelle*, Fr, is used as a salad plant, and is more delicate than the Rumex salads: its acid approaches nearly to that of the juice of lemons, or the acid of tartar, with which it also corresponds in its medical effects, being esteemed refrigerant, antiscorbutic, and diuretic An infusion of the leaves, or a whey made by boiling the plant in milk, given in ardent fevers, is said to allay inordinate heat, and to quench thirst

The expressed juice depurated, properly evaporated, and set in a cool place, affords a crystalline acid salt in considerable quantity, which may be used whenever vegetable acids are wanted It is employed to take iron moulds and ink stains out of linen, and is sold under the name of essential salt of lemons (*Withering*) This salt when genuine, which it seldom is, consists of the vegetable alkali and a peculiar acid, which, according to Bergman, seems more allied to the acid of sugar than that of tartar What is sold for it in this country, appears sometimes to consist of C Tart, with the addition of a small quantity of vitriolic acid For taking out spots in linen, the stained part is dipped in water, sprinkled with a little of the salt powdered, then rubbed on a pewter plate, after which the spot is washed out with warm water (*Curtis, from Neum Chem by Lewis*) Twenty pounds of leaves fresh yield six pounds of juice, from which two ounces, two drachms, and one scruple of salt have been obtained (*Lewis*)

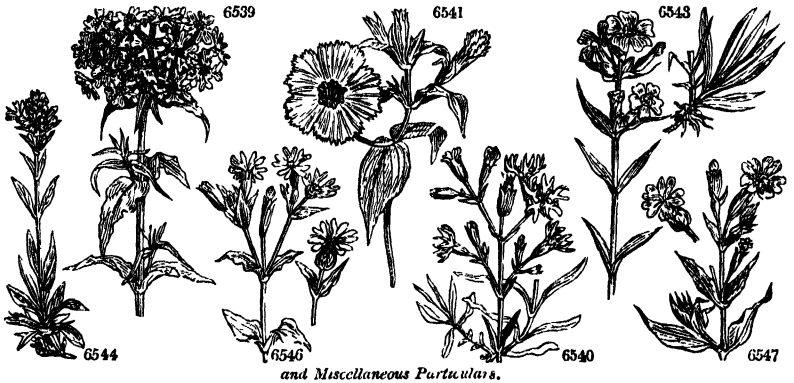
1066 *Agrostemma* Αγρου στεμμα, crown of the field The beauty of the flowers of the common cockle weed well entitles it to such a distinction The foreign species are very pretty annuals A Githago (*gith* or *gith* was the name of certain black and aromatic grains, supposed to have been of Nigella sativa, which were employed by the Romans in cookery The seeds of the plant Githago are externally similar) is an ornamental weed, and along with corn poppy and blue bottle makes a fine appearance in the fields of the slovenly husbandman, where the soil is dry and gravelly

6535 Hairy, Stem dichotomous, Flowers on long stalks, Leaves linear
β A slight variety, with longer divisions to the calyx
6536 Downy, Stem dichotomous, Peduncles long 1-fl. Cal. campanulate ribbed

6537 Downy, Flowers in umbellate heads, Cal cylindr clavate ribbed
6538 Smooth, Stem dichotomous panicled erect, Flowers terminal solitary

6539 Smoothish, Flowers fascicled, Cal cylindr clavate ribbed, Petals 2-lobed

6540 Stems ascending smoothish, Fl dichotomous fascicled, Cal camp 10-ribbed, Pet. torn with an appendage
6541 Smooth, Flowers terminal and axillary 1-3, Cal rounded clavate ribbed, Petals torn
6542 Hairy, Fl 2-3 fastigiate, Cal rounded clavate woolly, Petals 4-cleft
6543 Stem viscid about the joints, Limb of petals nearly entire, Leaves linear spatulate



6544 Smooth, Stems tufted upright, Fl in dense capitate umbels, Cal camp Petals bifid
6545 Fl solitary, Cal with ten keels, Petals bifid, linear-lanc subciliated
6546 Fl dichotomous panicled dioecious, Petals ½-bifid, Lobes narrow diverg Caps round

6547 Fl dichotomous panicled dioecious, Petals ½-bifid, Lobes broad approximating, Caps conical

6548 Smooth glaucous, Stem erect branched or simple, Leaves lanceolate connate obtuse
6549 Hairy pale green viscid, Leaves ovate, Petals length of calyx, Fl longer than fl.-stalk
6550 Hairy viscid diffuse, Leaves lanceolate oblong
6551 Stem much branched villous, Leaves ovate-lanc hispid, Flowers numerous in dichotomous panicles
6552 Leaves ovate, Flowers panicled, Cal villous longer than petals, Caps scarcely longer than sepals
6553 Hairy viscid, Flowers pentandrous, Petals emarginate
6554 Hairy subviscid, Flower 4-fid 4-androus, Pet bifid shorter than calyx
6555 Leaves linear lanceolate obtuse ciliated at base, Pet twice as long as calyx
6556 Glutinous hairy, Fl solitary in the dichotomies, Sepals lanc acute the length of petals, Leaves lanc.
6557 Leaves ellipt naked or hairy, Pan dichotomous few-fl with bractes, Caps oblong recurved
6558 Stems prostrate, Leaves ovate acute subciliated smooth, Flowers terminal subcorymbose
6559 Leaves sublinear acuminate smooth, Peduncles glandular, Pet. twice as large as calyx
β Leaves very narrow and smooth
6560 Downy, Leaves lanc-lin acute, Flowers very large in dichotomous umbels, Pet crenate and 2-lobed
6561 Leaves cordate ovate, Stem clasping, Peduncles in fruit very long deflexed

6562 Hairy viscid, Leaves lanceolate, Fl dioecious, Petals thrice as long as calyx
6563 Leaves elliptical scabrous, Peduncle terminal simple subsolitary, Capsule ovate
6564 Leaves oblong spatulate hoary, Sepals hoary scarious at edge, Caps cylindr longer than calyx
6565 Very smooth, Leaves lanc linear, Peduncle very long, Caps acute shorter than corolla

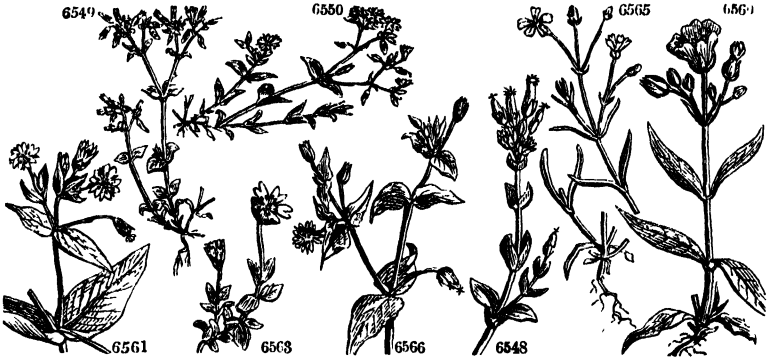
6566 This is the Cerastium aquaticum of English botany

and Miscellaneous Particulars.

A coronaria and flos-jovis are shewy border flowers, the first generally increased by seeds, and the other by cuttings or division of the plant

1067 *Lychnis* From λυχνος, a lamp, in allusion to the cottony leaves of some species, which have been used as wicks to lamps L. chalcedonica, *Croix de Malthe*, Fr and Portug, *Croce de Cavalcere*, Ital, and *C de Jerusalem*, Span, is an old and much esteemed border flower, the double varieties of which require some care in cultivation, to prevent their returning to the single state, and to propagate them by cuttings L. fulgens and coronata are also very handsome species "They do best in a light rich loamy soil, but they must be often taken up and divided, or they dwindle away, the best time of doing this is early in spring L. coronata thrives and flowers abundantly if planted out in the open ground in spring, but it requires to be taken up in autumn and potted, or the severe frosts in winter will kill it, or injure it very much All may be raised by cuttings planted under hand-glasses, or by seeds, which often ripen in abundance (*Bot Cult* 389)

L viscaria and flosculi are more hardy, and grow in common garden soil, and increase abundantly by division they are both old inhabitants of the flower garden L. diurna and vespertina are also border flowers in their double varieties



1068 *Cerastium* Derived from κερας, a horn, in allusion to the cornute form of the capsule of many species. Most of the annual species, and some of the others, are weeds, a few may be grown in pots or on rock-work, for both of which they seem well adapted. They are very prolific in seeds, and contribute materially to the support of small birds.

1069 *Larbrea* A genus founded by Aug St Hilaire, in the second volume of Mémoires du Muséum, upon the Cerastium aquaticum of Linnæus. He named it after the Abbé de Larbre, who at the age of 80, published a Flora of Auvergne.

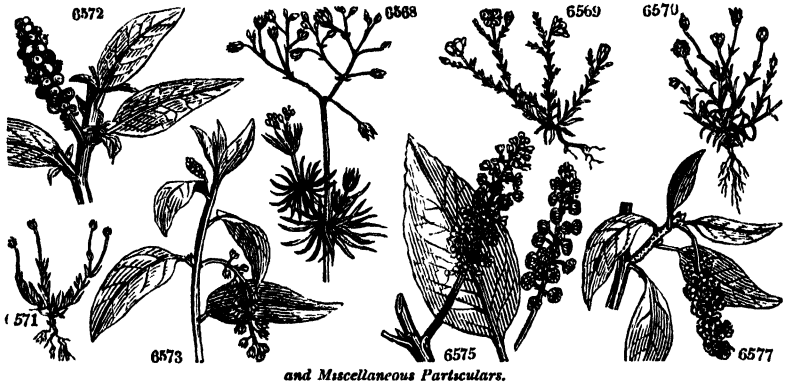
History, Use, Propagation, Culture,

1070 *Spergula.* From *spargere,* to scatter, because it scatters its seeds abroad, to the great profit of the farmer in Holland, who obtains from it meadows affording the most delicious butter S arvensis is a common weed in sandy soils, in Scotland called yarr, and in Norfolk pickpurse In the Netherlands and in Germany it is sown on corn stubbles, to supply a bite for sheep during winter It may be sown and reaped in eight weeks, either in autumn or spring It is said to enrich the milk of cows, so as to make it afford excellent butter, and the mutton fed on it is preferable to that fed on turnips Hens eat spurry greedily, and it is supposed to make them lay a great number of eggs, whether in hay, or cut green, or pasture Von Thaer observes, it is the most nourishing, in proportion of its bulk, of all forage, and gives the best flavored milk and butter It has been recommended to be cultivated in England, but it is not likely that such a plant can ever pay the expense of seed and labour in this country, even on the poorest soil, or at all events, as Professor Martyn observes, we have many better plants for such soils



1071 *Phytolacca* From φυτον, a plant, and *lacca,* lac, that is to say, a plant whose fruit gives out a fine red color like lac The English-American name Poke, applied to one species, is a corruption of Pocan, the name by which it was formerly known in Virginia

P decandra has large ramose roots, shoots half an inch in diameter, and five or six feet high, the leaves five inches long, and two and a half inches broad, smooth and of a deep green It grows vigorously in a good deep soil, and furnishes ample supplies of young shoots, which in America and the West Indies are boiled and eaten as spinage. (*Correa de Serra, in Hort Trans* IV. 446)

6567 Leaves whorled, Pedunc in fruit reflexed, Seeds reniform angular rough
6568 Leaves whorled, Flowers pentandrous, Seeds depressed winged smooth
6569 Leaves opposite subulate smooth · upper fascicled, Cal not nerved
6570 Leaves opposite subulate blunt naked, Pedunc solitary very long smooth
6571 Leaves opposite subulate awned ciliated, Pedunc very long solitary hairy

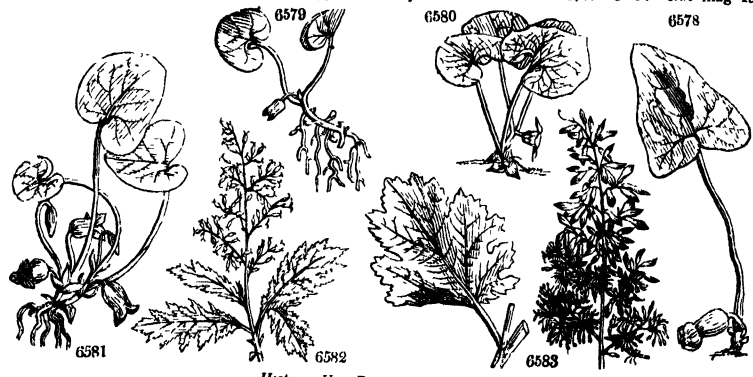
DECAGYNIA.

6572 Flowers octandrous octogynous
6573 Flowers decandrous pentagynous
6574 Flowers dodecandrous octogynous, Leaves ovate obl with a recurved point
6575 Flowers decandrous decagynous
6576 Flowers icosandrous decagynous
6577 Flowers dioecious

and Miscellaneous Particulars.

An ounce of the dried root, infused in a pint of wine, and given to the quantity of two spoonfuls, operates kindly as an emetic, and is preferable to most others, as it hardly alters the taste of the wine. In its medicinal properties, the Phytolacca approaches nearer to Ipecacuanha than to any other vegetable, but it is slower in its effects, and it remains longer in action, although it may be checked by an opiate Sometimes its operation produces vertigo and stupor The powder of the leaves possesses the same virtues as the root, but in a weaker degree It is one of the plants which have had a temporary reputation for the cure of cancer, and some sensible men have been converts to its efficacy The fermented berries give out a liquor which yields alcohol by distillation. From half a bushel of the berries, six pints of spirits were obtained, sufficiently strong to take fire and burn with readiness Two ounces of this given to a dog occasioned nausea and drowsiness, with slight spasmodic motions, but no vomiting Poultry are fond of the berries, but if eaten in large quantities, they give the flesh a disagreeable flavor The juice stains paper and linen of a beautiful purple color, but it will not last long, if a method could be found of fixing the dye, it might be very useful. The vignerons in Portugal for many years used the juice of the berries of the elder-bush to give a deep color to the Port wines, to which it was thought to communicate a disagreeable taste when mixed in too great a quantity Complaint of this practice having been made to government, orders were given that the stems of that plant should be cut down and destroyed before they produced berries but they forgot to include the Phytolacca in the proscription, so that the berries of that plant supply the same purpose in a much worse manner.

Class XI. — DODECANDRIA. 12 Stamens.



This is a small incongruous class, containing no extensive genus of importance except Euphorbia. Some botanists have been of opinion that it ought to be cancelled, but it is probable that Linnæus understood the application of his own principles as well as some of his more pretending followers, and it is certain that if the Linnean plan can be made to act successfully, its artificial arrangement must be rigorously observed Euphorbia and Reseda, which are usually referred hither, should more properly be referred, the former to Monœcia, and the latter to Polygamia

History, Use, Propagation, Culture,

lished by Morrison at Oxford, 1764, quarto, and other works B frutescens is very ornamental in its foliage. The Indian kings, Hernandez tells us, planted it in their gardens, which must have been for its beauty, as it is neither culinary nor medicinal, though the juice is acrid, and used in the West Indies to take off warts.

1074 *Bassia* So named by Koenig, in honor of Ferdinando Bassi, curator of the botanic garden at Bologna Tall trees, natives of the hottest parts of the East Indies, with tufted alternate leaves growing only at the end of the shoots Ripened cuttings root freely in sand

1075 *Blakea* So named by Dr Patrick Browne, after Mr Martin Blake of Antigua, a great promoter of useful knowledge, and a patron of the doctor's Natural History of Jamaica This is one of the most beautiful plants of the West Indies It supports itself for a time by the help of some neighboring shrub or tree, but it grows gradually more robust, and at length acquires a pretty moderate stem, which divides into a thousand weakly declining branches, well supplied with beautiful rosy blossoms on all sides It cannot display itself to so great advantage in our stoves, but it flowers freely, and thrives well in loam and peat, well supplied with water Ripe cuttings root in sand in moist heat and covered

1076 *Bejaria* So named by Mutis, in honor of Bejar, a Spanish botanist The original species are natives of New Grenada. That in gardens, which is a native of the southern states of North America, is a beautiful shrub from three to four feet high, with pink flowers of an agreeable scent. It is found upon the banks of swamps and ponds, and requires the protection of a frame or greenhouse

1077. *Agathophyllum* From ἀγαθὸς, good, and φύλλον, a leaf The leaf has a pleasant smell like cloves In Madagascar, where it is called *Ravendsara*, it forms a large tree with a rufous aromatic bark, and a heavy insipid wood. The leaves are alternate and coriaceous The dried fruit is very aromatic

1078 *Rhizophora* From ῥίζα, a root, and φέρω, to bear, in allusion to the numerous roots which are emitted by the seeds, which vegetate among the branches of the tree while yet adhering to their footstalk. This is the common Mangrove, which covers immense tracts of coast within the tropics, rooting and vegetating even as far as low water mark

1079 *Garcinia* So named in honor of Laurent Garcin, M D, F R S, who travelled into the East Indies. *Mangostana* is the Malayan name This tree bears a fruit, which in the East Indies ranks with that of the pine-apple It rises with a taper stem, sending out many branches, not unlike a fir-tree, with oval leaves, seven or eight inches long The flower is like that of a single rose, the fruit round, the size of a middling orange; the shell is like that of the pomegranate, the inside of a rose color, divided by thin partitions, as in oranges, in which the seeds are lodged, surrounded by a soft juicy pulp, of a delicious flavor, partaking of the strawberry and the grape, and is esteemed one of the richest fruits in the world. It is a native of the Molucca islands, whence it has been transplanted to Java and Malacca The head of the tree is in the form of a parabola, so fine and regular, and the leaves so beautiful, that it is looked upon in Batavia as the tree most proper for adorning a garden, and affording an agreeable shade It was introduced to England in 1789. According to Dr. Garcin, (*Phil. Trans*) "it is esteemed the most delicious of the East Indian fruits, and a

6584 Leaves lanceolate, Peduncles 1-flowered very long horizontal axillary
6585 Leaves elliptical acute, Peduncles 1-flowered nodding terminal

6586 Calyxes two, Leaves with three nerves finely striated across beneath

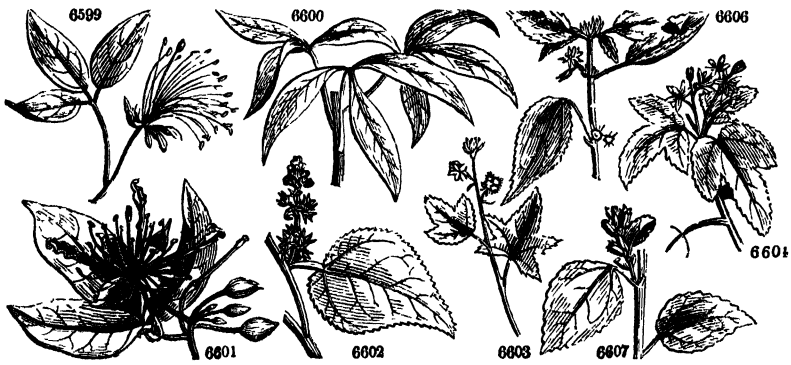
6587 Leaves ovate-lanceolate smooth, Flowers terminal in panicled racemes

6588 Leaves stalked alternate obovate obtuse coriaceous entire smooth

6589 Leaves acute, Fruit subulate-clavate

6590 Leaves ovate, Peduncles 1-flowered

6591 Leaves alternate stalked ovate entire smooth veiny



6592 Leaves ovate acuminate, Veins hairy beneath, Wings of the fruit equal
6593 Lvs. obl. ovate obtusely pointed green on both sides very soft beneath, Wings of fruit alternately larger

6594 Leaves all ovate, Stem climbing
6595 Lower leaves rounded upper ovate-lanceolate, Stem sarmentose

6596 Branches at end pubescent, Leaves cuneate oval, Flowers axillary

6597 Leaves opposite evergreen ovate shining serrated

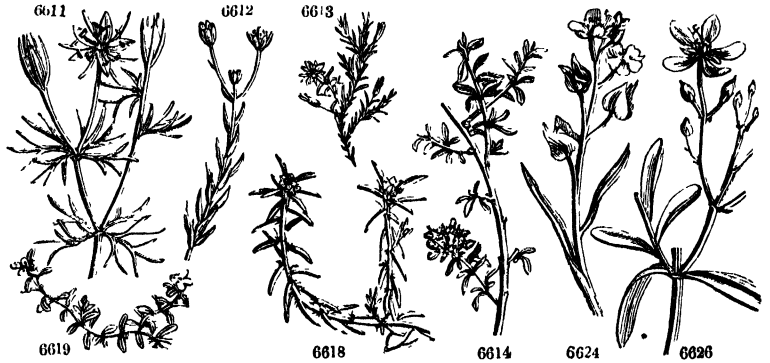
6598 Leaves oblong obtuse shining, Racemes terminal

and Miscellaneous Particulars.

great deal of it may be eaten without any inconvenience, it is the only fruit which sick people are allowed to eat without scruple It is given with safety in almost every disorder, and we are told that Dr Solander, in the last stage of a putrid fever in Batavia, found himself insensibly recovering by sucking this delicious and refreshing fruit The pulp has a most happy mixture of the tart and sweet, and is no less salutary than pleasant It is propagated by ripe cuttings in sand in moist heat But the plant rarely survives long after its importation

1080 *Grangeria* Named after N Granger, a traveller in Egypt, Persia, &c who died at Bassora in 1733. His voyage into Egypt was published in 1745 This is a tree the size of an oak, with alternate ovate entire leaves The flowers are small, in small terminal and axillary racemes.

1081. *Halesia.* So named by Ellis, in honor of the learned and venerable Stephen Hales, D. D, F. R. S., author of Vegetable Staticks, 1727 The species are very ornamental shrubs, valuable for blossoming early in the season. The flowers hang in small bunches all along the branches, each bud producing from four to eight or nine, they appear before the leaves, are of a pure snowy whiteness, and last for two or three weeks, they are succeeded by pretty large winged juiceless drupes, hanging likewise in bunches The leaves of H. diptera are six times the size of those of H tetraptera, and the fruit has two large wings and two minute ones. They are propagated by cuttings of the roots



1082 *Decumaria* Derived from *decem*, ten, all the parts of fructification answering to the number 10. It is commonly propagated by layers, but will grow by cuttings in sand under a hand-glass.

1083 *Eurya* A name of Thunberg's, supposed to have been formed from *ωευς*, broad, its application no one has been able to discover. The Eurya chinensis is a little evergreen bush, bearing many whitish flowers on the under side of the branches and hidden by the leaves. It is easily propagated by cuttings.

1084 *Aristotelia* After the celebrated ancient philosopher and naturalist Aristotle. Macqui is the name of this shrub in Chili. It grows freely in a sheltered situation, but its flowers are of little beauty They are succeeded by small berries of a purple or black color, slightly acid and eatable the inhabitants of Chili make a wine from them, which they give in fevers, and for curing the plague It is increased by layers or ripened cuttings.

1085. *Canella.* A name given by Murray, on account of the resemblance between its wood and the aromatic flavor of *Canella*, Cinnamon This tree rises very straight, from ten to fifty feet in height. The branches are erect, not spreading, and only at the top of the tree, furnished with petiolated leaves of a dark green color, thick, and shining like those of the laurel, and emitting a similar odor The flowers, which exhale a powerful aromatic perfume, are small, seldom open, and in bunches. The inner bark of the branches is freed from the cuticle, and dried in the shade This bark is stimulant, and slightly tonic It is a useful adjunct to bitters in some cases of dyspepsia and atonic gout; but it is employed chiefly on account of its flavor, and to correct the griping quality of the resinous cathartics. It is said to prove useful in scurvy (*London Dispensatory*, 207.)

History, Use, Propagation, Culture,

1086 *Cratæva* In honor of Cratævus, a Greek botanist and contemporary of Hippocrates. C Tapia, an American name, produces a fruit about the size of an orange, with a mealy pulp and a strong smell of garlic, which is communicated to the animals that feed on it All the species prefer a rich loamy soil, and may be increased by cuttings in sand under a hand-glass

1087 *Triumfetta* So named by Plumier, in memory of Giov Battista Triumfetti, prefect of the botanic garden at Rome, author of Hortus Romanus, 1681, and other works T semitriloba has a tough strong bark which serves for ropes and other conveniences of that kind in the inland parts of the West Indies The whole plant is mucilaginous and emollient Cuttings root in sand under a hand-glass All the species are uninteresting weed-like shrubs of tropical countries

1088 *Peganum* Πηγανον was the Greek name of the rue, which the modern plant resembles Harmala is the Arabic name (*harmel*) of the species so called The species are of easy culture and propagation in any light soil

1089 *Hudsonia* So named by Linnæus, in honor of William Hudson, apothecary of London, F R S, and author of Flora Anglica, 1762 and 1778, octavo. It is a heath-like plant which grows in peat soil, and young cuttings are rooted in sand under a bell-glass It is extremely rare in gardens

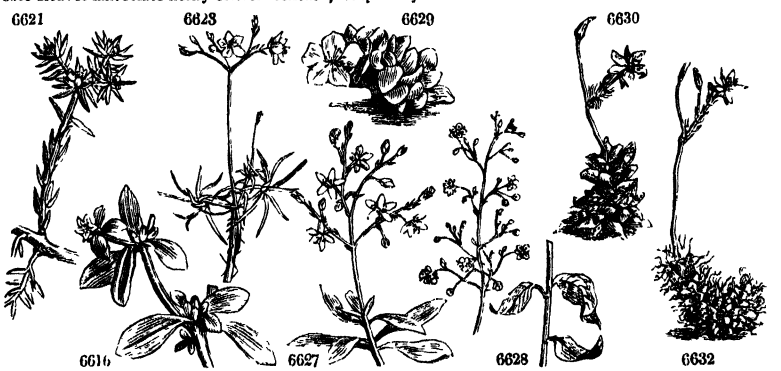
1090 *Nitraria* So named by Schreber, who first found it in Siberia near the nitre works, with other saline vegetables. This is a curious thorny shrub, peculiar to the salt deserts of Siberia. Pallas informs us, that the berries, though saltish and insipid, are eaten in the Caspian desert, but in that arid soil they are almost the only luxury Camels feed on the twigs Linnæus had the shrub twenty years before it flowered in Sweden;

6599 Unarmed, Leaves entire, Flowers gynandrous
6600 Leaflets ovate acuminate, Petals ovate roundish obtuse with globose ovaries
6601 Stem twining, Cor regular, Petals very long wavy, Peduncles capitate-racemose

6602 Leaves emarginate at base, Flowers without calyx
6603 Leaves entire at base undivided
6604 Leaves half three lobed, Flowers complete
6605 Leaves subcordate ovate entire serrated rather hairy · the floral ones lanceolate, Branches hairy
6606 Leaves ovate undivided rarely lobed
6607 Leaves rhomboid the upper lanceolate ovate, Flowers complete
6608 Leaves ovate cordate entire unequally serrated acuminate downy glandular at base, Fl complete
6609 Leaves ovate cordate 7-nerved acuminate serrate hairy, Flowers clustered
6610 Leaves oblong serrate 5-nerved softly hairy, Fl terminal clustered

6611 Leaves multifid, Stem herbaceous
6612 Leaves oblong acute, Stem herbaceous

6613 Leaves subulate acerose hairy, Calyx erect pubescent



6614 Leaves entire obtuse

6615 Leaves wedge-shaped fleshy, Fl sessile, Stem and branches nearly erect
6616 Leaves wedge-shaped fleshy, Fl sessile, Branches prostrate
6617 Much branched prostrate, Leaves wedge-shaped minute fleshy, Fl on long stalks and sessile
6618 Leaves subulate alternate hairy at the axillæ, Flowers sessile terminal
6619 Bractes 4, Flowers 4-fid, Joints of the stem hairy
6620 Leaves elliptical fleshy flat, Joints hairy, Flowers sessile terminal
6621 Leaves subulate, Cal hairy, Involucre many-leaved, Flowers about 3, Petals retuse
6622 Axils hairy, Leaves obversely oblong, Involucre 8-leaved

6623 Leaves cylindrical fleshy, Corymbs terminal stalked
6624 Leaves linear oblong ciliated, Flowers solitary
6625 Leaves flat channelled wedge-shaped emarginate mucronate, Raceme simple with a 3-cornered peduncle
6626 Leaves flat obovate mucronate, Corymb long, Peduncle 3-cornered
6627 Leaves ovate flat, Panicle terminal, Peduncle dichotomous
6628 Leaves lanceolate sessile opposite, Panicle branched

6629 Leaves ovate difform smooth green, Peduncles round long panicled

6630 Leaves ovate acuminate difform green shining cobwebbed, Raceme simple, Peduncles round long
6631 Leaves ovate acuminate difform shining cobwebbed dark-red, Rac simple, Peduncles very long
6632 Leaves imbricated expanded dark-green cobwebbed rugose above, Threads axillary longer than leaves
6633 Leaves lanceolate fleshy convex beneath, Scape leafy short 1-flowered

and Miscellaneous Particulars

and during ten years having in vain tried to make it flower in the garden at Upsal, he at length succeeded by watering the plant with salt water, it flowered, however, at Gottingen without this assistance Murray expresses a surprise that it has not been used in its native soil for making soda · but perhaps it does not grow in sufficient quantity, or there may be an ample harvest in that salt region of plants that answer the same purpose

In this country it thrives in sandy loam with a little salt put round it, and is increased by layers, or cuttings in sand under a hand-glass

1091 *Portulaca.* An ancient name of unknown origin The species are succulents of the easiest culture P sativa and oleracea were formerly cultivated as potherbs, salads, for garnishings and pickling, though now little used for any of these purposes.

1092. *Talinum* One of those names invented by Adanson, which probably were the mere creations of that botanist's erratic brain This is a succulent genus allied in habits to Portulaca, and of the easiest culture.

1393 *Anacampseros* Ανακαμψιεως was the name of a plant, to which the ancients attributed the quality of restoring the passion of love, for which purpose it was used in philtres and incantations from ανακαμπτω, to return, and εως, love The species are succulents, and grow freely in a sandy loam mixed with a little lime rubbish, and require but little water Cuttings root readily, but should be laid to dry a few days before being planted Leaves taken off close to the plants, and laid to dry a few days, and then planted, will root, and shoot out young plants at their base

History, Use, Propagation, Culture,

1094. *Lythrum* From λυθρον, black blood, in allusion to the color of the flowers L. Salicaria (willow-like, from *Salix*) although a common British plant, is considered a handsome border flower, and several varieties, differing chiefly in size, are in cultivation The whole plant is astringent, and has been used in medicine and tanning

1095 *Nesæa* Plants formerly referred to Lythrum, from which they seem to be satisfactorily distinguished

1096 *Heimia* Named by Link, in honor of Dr Heim, a celebrated Berlin physician A beautiful stove shrub with fine spikes of yellow flowers

1097. *Cuphea* From κυφος, curved, in reference to the form of its capsule Pretty herbaceous or shrubby plants, resembling Lythrum in aspect. C Melvilla is a very handsome stove shrub resembling Bouvardia coccinea.

1098 *Kleinhofia* So named by Linnæus, after Kleinhoff, formerly director of the botanic garden in Java. The leaves when bruised smell like violets, the flowers appear the greater part of the year, and the tree is seldom without fruit in all its different stages Cuttings root in sand under a hand-glass

1099 *Callscoma.* From καλος, beautiful, and κομη, hair, in allusion to the tufted yellow heads of flowers, for which the plant is remarkable Ripened cuttings root in sand under a hand-glass

1100 *Heliocarpus* From ἡλιος, the sun, and καρπος, fruit. The valves of its round and elegantly ciliated capsule resemble a little sun surrounded by its rays Cuttings root in sand under a hand-glass, and Miller found the seeds to vegetate after being kept ten years

1101 *Agrimonia* A corruption of the word *Argemone*, by which name the ancients distinguished a plant reputed useful in cataract of the eye, which in Greek was termed *argema* A Eupatoria was formerly regarded as a remedy of much importance as a tonic and deobstruent, but though still retained in the London Materia Medica, is seldom or never prescribed The root in spring is sweet scented, and the flowers fresh

6634 Leaves opp. cordate lanceolate, Flowers spiked 12-androus
6635 Leaves opp. lanc. Panicle virgate, Flowers 12-androus 3 together
6636 Leaves opp ovate obl acute cordate at base closely sessile, Branches 4-winged, Fl. axil. sol. 6-androus
6637 Leaves opposite linear, Flowers opp hexandrous
6638 Leaves alternate linear, Flowers hexandrous

6639 Smooth, Leaves opp. subsessile lanceolate entire, Pedunc axill opposite, Head 3-flowered

6640 Leaves opp somewhat downy stalked, Flowers whorled linear

6641 Leaves linear-lanceolate acute, Flowers axillary

6642 Fl. axill. solitary, Leaves ovate-lanceolate scabrous above, Stem erect hispid, Style hairy
6643 Branches decumbent viscous, Leaves ovate lanceolate hispid on short stalks
6644 Fl. axill sol Lvs. lanc hairy, Stem erect hairy, Style smooth, The 2 long filam having a tuft of wool longer [than anthers
6645 Raceme term. Leaves ellipt. and branches pubesc Stem shrubby, Fl decandrous
6646 Raceme term. Pedicels scattered, Bractes linear, Leaves ovate stalked pubescent
6647 Leaves small lanceolate, Flowers small solitary terminal, Bush compact
6648 Leaves lanceolate scabrous narrowed at each end, Racemes term. Cal long bowed, Petals O

6649 A smooth tree, with broad cordate acuminate entire leaves

DIGYNIA.

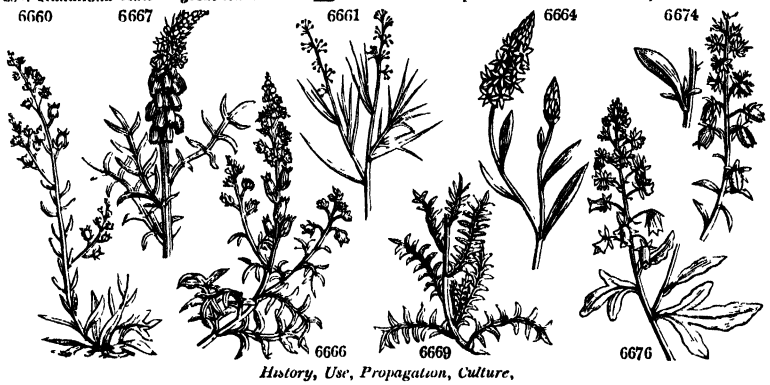
6652 Fruit hispid, Cauline leaves pinn with obl ovate leaflets, Spikes elevated, Pet twice as long as calyx
6653 Fruit hispid, Leaves pinnate with obl leaflets the lower veiny short, Pet twice as long as calyx
6654 Fruit hispid, Cauline leaves pinnate with obl leaflets, Spikes subsessile, Petals 3 times as long as calyx
6655 Fruit hispid, Cauline leaves pinnate with many lanceol leaflets, Petals half as long again as calyx
6656 Spikes virgate, Fruit reflexed turbinate furrowed crowned with hairs
6657 Fruit smooth, Cauline leaves ternate, Stamens usually 8

TRIGYNIA.

6658 Leaves lanc entire with a tooth on each side at base, Cal 4-fid
6659 Leaves lanceolate wavy entire with two glands at base

and Miscellaneous Particulars

gathered smell like apricots When the plant is coming into flower it will dye wool a full nankeen color, and gathered in September a darker yellow. It has been used for dressing leather Sheep and goats eat it, but kine, horses, and swine refuse it.



1102. *Reseda.* From *resedo*, to calm, to appease The Latins thought it useful as a topical application in external bruises R Luteola, a diminutive of *luteus*, yellow, is used by dyers, especially in France (Chaptal's Chimie appliqué à l'Agriculture, &c.) It affords a most beautiful yellow dye for cotton, woollen, mohair, silk and linen. Blue cloths are dipped in a decoction of it, in order to become green The yellow color of the paint called Dutch Pink, is obtained from this plant The entire plant, when it is about flowering, is pulled up and employed both fresh and dried Mr Swayne observes, that it is one of the first plants which grow on the rubbish thrown out of coal pits It flowers in June and July The root and bottom leaves are formed from the fallen seeds before winter, and thus it happens in this, as in many other cases, that the wild plant is biennial, whilst the cultivated plant, growing from seeds sown in the spring, is annual It is an observation of Linnæus's, that the nodding spike of flowers follows the course of the sun, even when the sky is covered; pointing towards the east in a morning, to the south at noon, westward in the afternoon, and to the north at night.

R. odorata is a well known and universal favorite The flowers are highly odoriferous, and there are very few to whom this odor is offensive The plant is in great demand in London for rooms and placing in balconies, and forms for these purposes an extensive article of culture among the florists and market gardeners. The plants are in many cases sown and transplanted into pots, three or four plants to a pot four inches in diameter. To obtain plants for blowing from December to February, a sowing should be made in July in the open ground, and the plants potted in September The crop for March, April, and May, should be sown not later than the twenty-fifth of August, the plants from this sowing will not suffer by exposure to rain, whilst they are young, they must, however, be protected from early frosts, like the winter crop, they are to

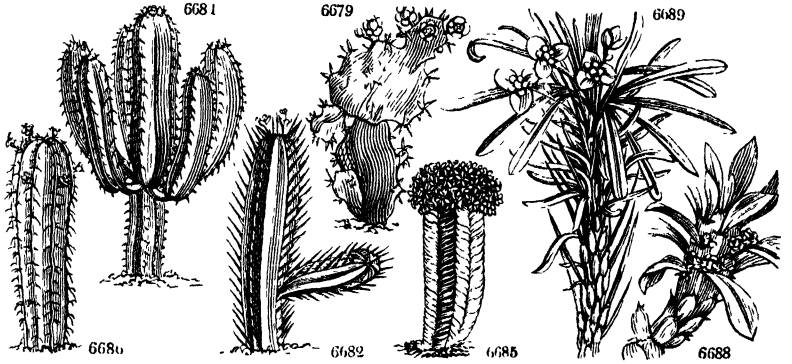
History, Use, Propagation, Culture,

be thinned in November, leaving not more than eight or ten plants in each pot, and at the same time, the pots being sunk about three or four inches in some old tan or coal ashes, should be covered with a frame, which it is best to place fronting the west for then the lights may be left open in the evening, to catch the sun whenever it sets clear The third, or spring crop, should be sown in pots, not later than the twenty-fifth of February, these must be placed in a frame, on a gentle heat, and as the heat declines the pots must be let down three or four inches into the dung-bed, which will keep the roots moist, and prevent their leaves turning brown, from the heat of the sun, in April and May The plants thus obtained, will be in perfection by the end of May, and be ready to succeed those raised by the autumnal sowing (*Rushon in Hort Trans* ii 372)



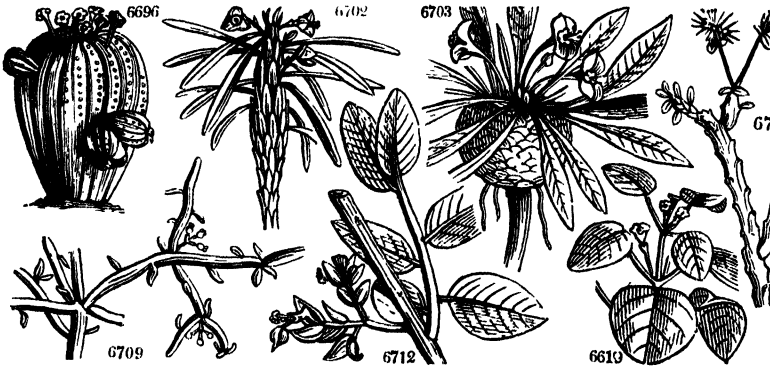
R. odorata frutescens, if left to itself, hardly appears a distinct variety, but trained against a wall or to a stick it, and also the common mignonette, may be made to assume a frutescent character According to Sabine, the tree mignonette is to be propagated from seeds sown in spring, it may also be increased by cuttings, which will readily strike The young plants should be put singly into small pots, and brought forward by heat, that of a gentle hot-bed being preferable, but they will grow well without artificial heat As they advance, they must be tied to a stick, taking care to prevent the growth of the smaller side shoots, by pinching them off, but allowing the leaves of the main stem to remain on for a time to support and strengthen it When they have attained the height of about ten inches or more, according to the fancy of the cultivator, the shoots must be suffered to extend themselves from the top, but must be occasionally stopped at the ends, to force them to form a bushy head, which by the autumn will be eight or nine inches in diameter, and covered with bloom. Whilst the plants are attaining their proper size, they should be shifted progressively into larger pots, and may ultimately be left in those of about six inches in diameter at top (*Hort Trans* iii 181)

Mr Lindley's theory of the nature of the inflorescence of this genus being remarkable, and only explained in his Collectanea Botanica, which is in few hands, it is here transcribed entire "The usual idea of the flower of Reseda has been, that it is furnished with a calyx of a variable number of divisions, with as many petals, producing from their surface certain anomalous appendages, and with an ovary and stamens inserted on a great fleshy body, called nectary by Linnæan botanists, squama by others, and raised to the rank of a distinct organ by M Mirbel, under the name of Gynophore To us, however, it has always appeared, that this could by no means be the real structure of the plant, and that by a slight alteration of terms it not only might be much more satisfactorily explained, but its real affinity ascertained with some degree of probability For even allowing for a moment an analogy between the nectary of this plant and the discus of others, particularly of some Tiliaceæ, there is still a great difficulty remaining to be overcome in the anomalous structure of the supposed petals, of which we can imagine no probable explanation We are therefore of opinion, that a much more natural mode of understanding Reseda is to consider it as having compound flowers, taking the calyx of authors for an involucrum, their petals for neutral florets, and their nectary for the calyx of a fertile

6660 Leaves lanceolate wavy hairy
6661 Leaves linear toothed at base, Styles 4
6662 Leaves linear entire, Styles 4, Barren florets 2
6663 Leaves linear entire, Fl trigynous, Fruit clavate, Stem twiggy
6664 Leaves lanceolate entire, Fruit stellate
6665 Nearly related to R luteola, but the leaves are not toothed at base
6666 Leaves pinnate recurved at end, Styles 4, Involucre 5-parted spreading, Stem half shrubby
6667 Leaves pinnate, Styles 4, Involucres 6-parted
6668 Branches above and younger leaves covered with large distinct blisters
6669 Leaves pinnate wavy, Styles 3 or 4
6670 Leaves bipinnatifid very rough, Flowers spiked
6671 Leaves all trifid segments of the upper leaves linear flat, of the lower lanceol wavy, Stem quite simple
6672 Leaves linear simple or trifid, Stem erect branched, Fruit obovate
6673 Leaves all trifid the lower pinnate
6674 Leaves entire and 3-lobed, Involucres 6 parted very large
6675 Leaves entire and 3-lobed, Involucres shorter than florets
6676 Leaves entire and 3-lobed, Involucres as long as florets

§ 1 *Stem thick, fleshy, naked, or with a few leaves, Flowers dispersed*
* *Prickly*

6677 Fleshy prickly compressed channelled inflexed at end, Prickles twin diverging
6678 Naked erect prickly triangular jointed, Branches erect somewhat channelled
6679 Prickly nearly naked triangular jointed, Branches spreading
6680 Naked prickly jointed with 3-cornered expanded branches obsoletely marbled with white
6681 Prickly naked nearly quadrangular, Prickles twin hooked, Fl subsessile
6682 Prickly naked with 7 angles, Prickles solitary subulate flower ascending
6683 Prickly naked erect with 9 angles, Prickles solitary flower-bear ascending fuscous, Branches penaulous
6684 Prickly half naked, Angles warted with spines between, The young warts leafy
6685 Prickly naked with many angles, Prickles solitary subulate
6686 Prickly naked with many angles, Prickles twin
6687 Prickly naked with numerous simple erect 10-13-angled stems, Prickles dark
6688 Prickly half naked, Prickles twin, Angles obliquely warted leafy upwards, Leaves oblong
6689 Stem round half naked leafy upwards, Leaves lanc linear, Peduncle 1-fl at length spiny
6690 Prickles twin, Stem rounded or angular, Angles obliquely warted, Leaves nearly oblong
6691 Prickles twin horizontal, Stem rounded simple, Leaves oblong spatulate very large



and Miscellaneous Particulars

floret in the middle In support of this opinion, we may observe, firstly, that there is a difference in the time of expansion of the neutral florets, and of the stamens of the fertile one, the former being quite open, in very many capitula, before one anther of the latter has burst in a single flower Secondly, that there is an evident analogy between the appendages of the neutral florets, and the stamens of the perfect florets, inasmuch as in Reseda odorata those of the upper sterile florets are of nearly the same number as the real stamens, because in Reseda alba, and some others, in which a union of filaments takes place in the perfect floret, there is a corresponding but more complete union of the sterile appendages, and because occasionally, in Reseda odorata, stamens are changed into bodies altogether similar to the sterile appendages, and in Reseda Phyteuma the same appearance is always assumed by the perfect stamens after the anthers have performed their functions Thirdly, that there is an equal analogy between the calyx of the neutral florets, and that of the perfect floret, because both have a peculiar glandular margin, the same form, both produce their stamens from their surface, and because the upper edge of the calyx in sterile florets has the same relation to the axis of each particular head, as that of the perfect floret has to the axis of the whole inflorescence. In Reseda Phyteuma, which has the margin of its neutral florets rolled back, the same thing occurs in the perfect floret Fourthly, that there is no instance of the same analogy existing between the discus and petals of other plants We may also observe, that in Reseda Phyteuma, there is a campanulate tube to the calyx, into the upper edge of which the stamens are inserted

" To determine the affinity of Reseda to other orders, will not be so easy as to explain its structure One cannot avoid remarking the resemblance between its calyx and the squama of Amentaceæ and Ulmaceæ. Ficoideæ, Grossulaceæ and Cacti, on account of placentation and structure of seed, may be supposed to have a certain relation to it as may Chenopodeæ with regard to inflorescence, absence of petals, and habit. But we are disposed to believe its real place in the system is in the neighbourhood of Euphorbiaceæ, where we have placed it in Flora Scotica They agree with it in having the same sort of aggregation of flowers, similar habit, no corolla, and ternary division of ovarium The insertion of their ovula is the same, as is also the direction of the radicle They differ, however, firstly, in the presence of albumen, which yet is not entirely absorbed in Reseda till the seed is perfectly ripe, and which exists even after that time in the seed of R alba, where it is fleshy as in Euphorbiaceæ Secondly, in their solitary seeds, in which respect Resedaceæ may be supposed to bear the same relation to Euphorbiaceæ as Campanulaceæ do to Compositæ, or as some sections of Rubiaceæ to the others In R suffruticulosa the ovules appeared to be reduced to a single row, and the same is said to obtain in Ochradenus Thirdly, in elastic dehiscence of capsule, but as this is not universal in Euphorbiaceæ, it is not, strictly speaking, an objection of importance " (*Lindley's Coll Bot*)

1103 *Euphorbia* Euphorbus was physician to Juba, king of Mauritania, and first used this plant in medicine This is a genus of grotesque and curious plants, few of them of either beauty or use, and most of

History, Use, Propagation, Culture,

the annuals poisonous weeds. One species (E. edulis), not yet introduced, is said to be used as a pot-herb in Cochin China, one (E. punicea) is a very splendid plant, and the E. officinarum, and one or two other species gathered along with it, are used in medicine They are all milky, mostly herbaceous, several however shrubby, upright for the most part, very few of them creeping, some are leafless, but most of them are leafy. Stems angular or tubercled, or more frequently cylindric or columnar; unarmed, or in the angular sorts resembling the upright Cactuses, and armed with prickles, which are either solitary or in pairs, placed in a single row on the top of the ridges Such as have leaves have them simple, most frequently alternate and naked, in some sorts, however, they are opposite, and are then commonly attended with stipules, and in a few they are placed by threes in whorls Peduncles in the leafless sorts naked, bearing from one to three flowers; in the leafy ones axillary, but more frequently from two to five or more in a terminating umbel, each some-

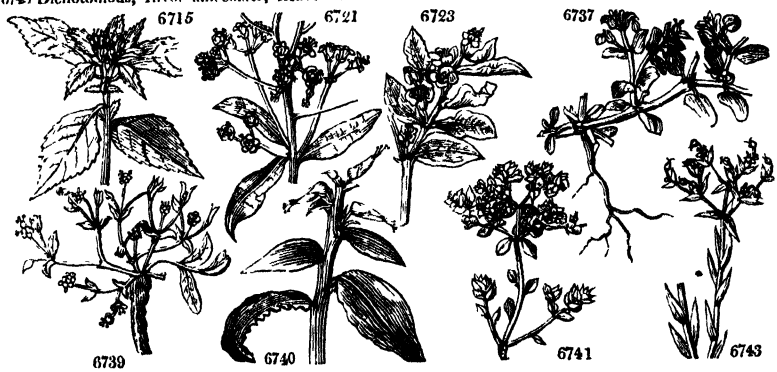
6692 Prickly elliptical obtuse furrowed, Prickles subsolitary, Peduncles 3-flowered
6693 Warts very large green downy at end, Spines about 4 strong black at end
6694 Simple rounded obovate with warts woolly at end [than the rest
6695 Columnar, Warts small numerous with many small spines between, Two spines in each cluster longer

** *Unarmed.*

6696 Unarmed globose with many angles
6697 Unarmed imbricated, Warts with one leaf, Flowers somewhat stalked, Divisions palmate
6698 Stem closely tessellated with warts upwards thickly branched
6699 Unarmed imbricated with warts bearing a linear leaf
6700 Unarmed with round procumbent branches, Warts 4-cornered
6701 Unarmed imbricated, Warts with a roundish leaflet, Fl term solitary sessile with palmate segments
6702 Unarmed imbricated, Warts with a lanceolate leaflet, Fl stalked with entire segments
6703 Unarmed imbricated capitate, Warts rhomboid with lanceolate stalked leaves, Segm of flower entire
6704 Unarmed half naked shrubby filiform flaccid, Leaves alternate
6705 Warts large imbricated hooked at end the upper having an oval leaflet at length withering
6706 Unarmed warted, Warts with a deciduous leaf, Pedunc solitary or 3 terminal 1-flowered
6707 Unarmed naked leafless branched, Branches square, Fl solitary terminal
6708 Unarmed shrubby upright, Head terminal, Leaves lanceolate smooth glaucous
6709 Unarmed half naked shrubby filiform erect, Branches spreading regularly clustered

§ 2. *Stem uniform, shrubby, upright, Flowers scattered or aggregate, not in umbels*

6710 Unarmed, Leaves lanceolate clustered entire, Umbel terminal sessile, Involucre connate colored
6711 Unarmed shrubby upright, Umbel 5-fid term Involucre oblong, Leaves lanceolate smooth
6712 Unarmed shrubby, Leaves oblong alternate distichous, Bractes persistent
6713 Unarmed shrubby naked, Branches rounded effuse dependent jointed
6714 Umbel multifid dichotomous, Involucre subcordate the first 3-leaved
6715 Unarmed, Leaves panduriform ovate, Fl term suberect, Involucre colored
6716 Villous, Leaves with long stalks alternate broadly ovate repand-toothed, Stem erect striated
6717 Leaves opp minute stalked obovate entire, Two glands on the stem at the base of petioles
6718 Unarmed shrubby, Leaves ovate entire, Cyme axillary naked
6719 Leaves opp subcordate stalked emarginate entire, Stem shrubby
6720 Stalks whorled longer than the orbicular leaf, Fl solitary, Stem unarmed naked
6721 Leaves scattered lanceolate acute smooth, Pedunc dichotomous, Caps muricate
6722 Unarmed shrubby, Leaves scattered lanc mucron Fl solitary term with a 3-leaved involucre Caps muricate
6723 Leaves oval entire wavy edged with white, Caps smooth, Stem hairy
6724 Dichotomous, Leaves ovate serrate acute villous, Fl solitary, Upper dichotomies cymose



§ 3. *Dichotomous, herbaceous, Flowers solitary or aggregate, not umbelled.*

6725 Unarmed branched, Leaves subcordate entire shorter than their stalk, Fl solitary
6726 Dwarf hairy, Leaves opp oval toothed, Flowers clustered at the end of branches
6727 Dichotomous, Leaves serrate oval-obl smooth, Corymbs terminal, Branches divaricate
6728 Dichotomous, Leaves ovate obl acute at each end smooth stalked entire, Capsules smooth
6729 Dichotomous, Leaves oval obsol serrated, Pedunc axill 3-flowered, Stems diffuse smooth
6730 Dichotomous diffuse, Lvs obov oblique somewhat cord at base toothletted at end, Pedunc 1-fl. axillary
6731 Dichotomous, Leaves serrate oblong hairy, Fl axill solitary, Branches spreading
6732 Dichotomous, Leaves ovate hairy stalked entire, Pedunc axill 1-fl Caps smooth
6733 Dichotomous, Leaves serrate oval oblong, Pedunc 2-headed axillary, Stem erect
6734 Dichotomous, Leaves subcrenate linear, Fl fascicled term Stem erect
6735 Dichotomous, Leaves serrate oval-obl Heads axill clustered subsessile, Stems procumbent
6736 Dichotomous, Leaves crenulate roundish smooth, Fl solitary axill Stems procumbent
6737 Dichotomous, Leaves entire half cordate, Fl solitary axillary, Stems procumbent
6738 Leaves opp entire lanceolate obtuse, Fl solitary axillary, Stems procumbent
6739 Dichotomous, Leaves entire lanceolate, Peduncles axillary 1-fl as long as leaves, Stem erect
6740 Branches alternate dichotomous channelled filiform, Leaves ovate stalked pubescent

§ 4 *Flowers umbelled with an involucre*

* *Umbel trifid*

6741 Dichotomous, Invol ovate, Leaves entire obovate stalked
6742 Dichotomous, Invol subcordate mucronate, Leaves lanceol obtuse
6743 Dichotomous, Invol lanceolate, Leaves linear

and Miscellaneous Particulars.

times in a many-flowered head, but more often dichotomous, trichotomous, or even tetrachotomous, with single flowers between the divisions at the base and in the forkings, having bractes in number the same with the peduncles, forming a sort of involucre The juice of every species of Spurge is so acrid that it corrodes and ulcerates the body wherever it is applied, so that it is seldom used internally. Externally it is dropped on warts or corns to remove them, and in the hollow of a decayed tooth, to remove the pain by destroying the nerve, or it is rubbed behind the ears to give relief in the tooth-ache by blistering.

E officinarum, and also antiquorum and canariensis, furnish the Euphorbium of the Materia Medica In the lower regions of Mount Atlas, the inhabitants collect the concreted gum resin, which they call *furbume*, in September It is obtained by making slight incisions in the branches of the plant with a knife, from which a milk-like juice exudes, and forms into tears of an oblong or roundish form. The quantity yielded is so

History, Use, Propagation, Culture,

considerable, that the plants are cut once only in four years, the supply then obtained being sufficient for that space of time for all Europe The recent juice is so corrosive as to erode the skin wherever it touches, and the people who gather the gum are obliged to tie a cloth over their mouth and nostrils, to protect them from the acrid dust of the withered branches, which induces the most violent sneezing It is inodorous, and, when first chewed, has little taste, but it soon gives a very acrid burning impression to the tongue, palate, and throat, which is very permanent, and almost insupportable Euphorbium possesses powerful cathartic, emetic, errhine, and rubefacient properties It has been given as a hydragogue in dropsies, but, owing to the violence of its effects, its internal use is now exploded neither as an errhine can it be used alone, for it occasions so

6744 Dichotomous, Umbel trifid, Involucre broad obovate, Leaves entire obovate spatulate on long stalks
6745 Dichotomous, Leaves lanceolate obovate serrate, Involucre cordate, Caps warted
6746 Involucre 4-leaved, Stem naked, Leaves oblong emarginate
6747 Umbel subtrifid, Leaves mucronate, Cauline spatulate lanceolate Involucre ovate, Caps smooth

*** Umbel 4 or 5-fid*

6748 Umbel 4-fid dichotomous, Leaves opposite entire
6749 Umbel 4-fid trifid, Involucre ovate acute, Leaves lanceolate lower spatulate
6750 Umbel 4-fid dichotomous, Involucre obtuse, Leaves alternate cuneate emarginate mucronate Stem diffuse
6751 Umbel 4-fid bifid, Involucre reniform the first obcordate
6752 Umbel 4 or 5-fid twice dichotomous, First involucre oblong upper rhomboid-roundish, Leaves linear lanceolate
6753 Umbel 5-cleft bifid, Involucre ovate, Leaves linear erect
6754 Umbel 5-cleft simple, Involucre ovate, first 3-leaved, Leaves oblong entire
6755 Umbel 5-cleft bifid, Upper leaves rounded obovate serrulate mucronate lower lanceolate reflexed
6756 Umbel 5-cleft bifid, Involucre ovate toothletted, Leaves entire lanceolate oblong villous beneath
6757 Umbel 5-cleft bifid, Involucre subovate toothletted, Leaves lanceolate obtuse, Caps. warted hairy
6758 Umbel 5-cleft bifid, Rays nodding, Involucre ovate entire, Leaves lanceolate acute, Caps warted smooth
6759 Umbel 5-cleft bifid, Involucre ovate mucronate, Leaves lanceolate the lower involute imbricated downwards
6760 Umbel 5-cleft dichotomous, Involucre subcordate concave, Leaves linear lanceolate acute smooth spreading
6761 Umbel 5-cleft bifid, Involucre cordate reniform, Leaves imbricated upwards

6762 Branches filiform, Leaves numerous linear oblong retuse Rib mucronate, Fl solitary terminal
6763 Umbel 5-cleft dichotomous, Leaves and involucre linear lanceolate acute
6764 Umbel 5-cleft dichotomous, Involucre ovate lanceolate mucronate, Lower leaves setaceous
6765 Umbel 5-cleft dichotomous, Involucre cordate acute, Leaves linear lanceolate the upper broadest
6766 Umbel multifid double, Involucre subcordate, Leaves linear
6767 Umbel multifid clustered, Involucre subcordate, Leaves numerous close very narrow
6768 Umbel multifid dichotomous, Involucre half orbicular cordate, Sterile branches many, Lvs linear lanceolate obtuse
6769 Umbel 5-cleft bifid, Involucre cordate mucronate, Leaves oblong
6770 Umbel 5-cleft bifid, Involucre half orbicular cordate subimbricate, Leaves linear imbricated backwards
6771 Umbel 5-cleft bifid dichotomous, Involucre obovate, Leaves cuneiform serrate smooth, Caps smooth
6772 Umbel 5-cleft trifid dichotomous, Involucre 2-leaved reniform, Leaves amplexicaul cordate serrate
6773 Umbel multifid bifid, Involucre orbicular, Leaves linear lanceolate villous
6774 Umbel 5-cleft trifid, Involucre oval acuminate colored, Caps smooth, Leaves glaucous beneath
6775 Umbel 5-cleft trifid, Involucre ovate, Leaves lanceolate serrulate villous, Caps warted
6776 Umbel 5-cleft trifid dichotomous, Involucre and leaves oblong obtuse, Divisions of involucre white
6777 Umbel 4-fid bifid, Involucre obovate, Leaves spatulate lanceolate entire reflexed, Stem half shrubby branched
6778 Umbel 5-cleft trifid dichotomous, Involucre ovate, Leaves lanceolate, Caps woolly
6779 Naked smooth, Umbel 5-cleft bifid, Leaves sessile lanceolate veiny on each side
6780 Umbel 5-cleft trifid bifid, Involucre ovate entire, Leaves lanceolate hairy subserrulate at end
6781 Umbel 5-cleft 4-fid dichotomous, Involucre roundish acute, Leaves lanceolate
6782 Umbel 5-cleft 3-fid dichotomous, Involucre with a hairy keel, Leaves serrate lanceolate, Caps warted

6783 Umbel 5-cleft 3-fid dichotomous, Involucre lanceolate, Leaves lanceolate toothed pubescent, Caps smooth warted
6784 Umbel multifid bifid, Involucre subcordate 2-horned, Barren branches with 1-shaped leaves
6785 Umbel 5-fid bifid, Involucre perfoliate cordate acute, Leaves lanceolate entire
6786 Leaves lanceolate obtuse, Umbel 5-fid dichotomous, Involucre ovate obtuse 2-horned
6787 Umbel 5-fid bifid, Leaves spatulate lanceolate mucronate coriaceous serrulate, Involucre ovate, Caps smooth
6788 Leaves obversely obl Involucre oblong and ovate serrulate at end, Umbel 5-fid dichotom Caps keeled twice
6789 Leaves linear with long points entire smooth, Umbel 5-fid bifid, Involucre lanceolate, Leaves 2-horned
6790 Umbel trifid dichotomous, Leaves serrate somewhat hairy lower spatulate, upper and involucre spatulate
6791 Upper branches hairy, Leaves smooth lanceolate, Caps warted, Involucre cordate
6792 Umbel sub-5-fid bifid, Caul leaves and involucre cordate lanceolate obtuse toothletted, Involucre reniform
6793 Leaves lanceolate, Umbel 5-fid, Involucre oval obtuse, Caps ramentaceous hairy

**** Umbel 6-many-fid*

6794 Umbel multifid dichotomous, Involucre roundish entire, Branches none
6795 Umbel multifid dichotomous, Involucre subcordate, Branches sterile, Leaves setaceous, Cauline lanceolate
6796 Umbel multifid bifid, Involucre subtriangular, Leaves sessile erect, Caps rough
6797 Umbel 8-fid bifid, Involucre subovate, Leaves spatulate spreading fleshy mucronate rough at edge
6798 Umbel dichotomous bifid, Involucre roundish mucronate, Leaves obovate imbricate serrulate
6799 Umbel 5-fid bifid, Involucre cordate roundish entire, Leaves lanceolate mucronate coriaceous

and Miscellaneous Particulars.

much inflammation as to produce hæmorrhage from the nostrils, and swells the integuments of the head. When properly diluted, however, with starch or any other inert powder, and cautiously used, it is an effectual and excellent errhine in lethargy, deafness, palsy, amaurosis, and similar cases. (*London Dispensatory*, 298)

E. Lathyris has seeds about the size and color of caper buds, and in Paris is sometimes substituted for that pickle Eaten in any quantity they must prove highly deleterious

E. helioscopia has a peculiarly acrid milky juice, which is often applied by country people to eat off warts, but should be used with caution where the parts are tender According to Linnæus, sheep eat it, and are purged by it, and their flesh acquires a bad taste, but this is not the case with cows

History, Use, Propagation, Culture,

Many of the stove species of this genus are succulents, and will thrive the better if a little lime rubbish be added to their sandy loam They are somewhat difficult to strike Sweet says, "The way I have succeeded best, is to stick them in the tan amongst the pots in a good heat, and not cover them with any glass" (*Bot. Cult.* 55)

The inflorescence of this genus is not now considered to consist of twelve stamens surrounding an ovary, but almost as in Reseda, of a number of monandrous naked male florets surrounding a naked female floret This manner of understanding Euphorbia was first indicated by Jussieu, and afterwards correctly explained by Mr Brown

1104 *Pedilanthus* From πεδίλον, a slipper, and ἄνθος, a flower, in allusion to the form of the involucre A genus resembling Euphorbia in properties and appearance

1105 *Visnea* This seems to be a blunder of the younger Linnæus for *Visnea*, which now is the name of a distinct genus, which see Ripened cuttings root freely in sand

6800 Umbel multifid 3-fid bifid, Involucre ovate, Leaves lanceolate, Branches barren
6801 Umbel multifid bifid, Involucre broadly cordate Leaves obl. emarg smooth, Stem branched, Capsules warted

curious S tectorum, common on the roofs of buildings, is used by country people as an application to burns, inflammations, and ulcers, alone, in a bruised state, or mixed with cream Linnæus informs us, that house-

Class XII. — ICOSANDRIA. Stamens many, perigynous, or inserted into the Calyx.

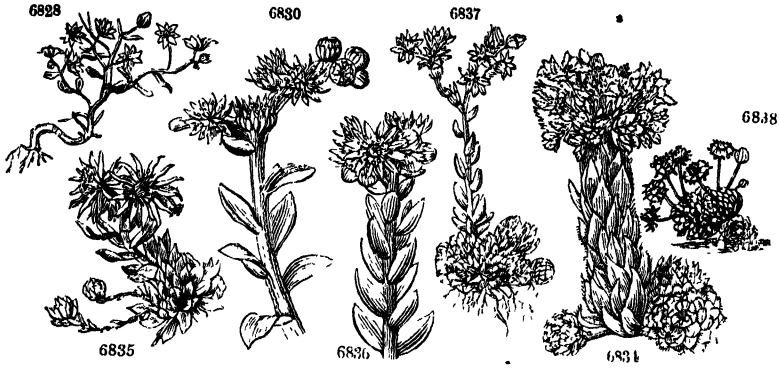
To gardeners this is one of the most interesting of the Linnean classes, containing a greater proportion than any other of objects which come within their observation and management It also consists of genera for the most part naturally allied, and comprises not only the most remarkable portion of Pricoideæ, all Cacti, and the chief of the Myrtaceæ, but almost every genus of the beautiful and hardy tribes of Rosaceæ Its characters are well defined, and depend upon the insertion of a number of distinct stamens, exceeding twenty, into the inner surface of the calyx, modifications of which organ are here found to be of more than ordinary importance in characterising the genera

The genera are extremely natural, and have been all studied with unusual attention Some difference of opinion exists among botanists as to the limits which ought to be assigned to them, and great diversity of nomenclature has thence arisen "But," as has been observed by a modern author, "in a class so strictly natural as this is, greater difficulty is always to be expected in finding characters for genera, than in those of which our knowledge is more imperfect, and whose series of individuals may therefore be considered less complete" In the apple and pear tribe, Pomaceæ, where the greatest difficulty is thought to exist, we adopt Mr Lindley's arrangement, as published in the Transactions of the Linnean Society, which we find admitted by all botanists of authority

But if it is difficult to ascertain the definite limits of the genera of Icosandria, it is yet more perplexing to arrive at a satisfactory conclusion respecting the species of which the genera are constituted Having all been, as long as gardens have existed, the objects of cultivation, it has happened that many individuals have, under the action of domestication, wandered so far from their original types, as to have acquired new characters for themselves, of so peculiar a kind as to have rendered it impossible at the present day to refer them with certainty to the source from which they originally sprung To remedy this confusion, which has been thus increasing for ages, some persons have thought it necessary to distinguish the species by such artificial characters as they are now found to possess, without reference to any changes the genera may have undergone, but it has been found that no facilities of discrimination have been gained by multiplying distinctions in consideration of differences which are neither permanent or remarkable, nor connected with natural habit, but purely artificial To others it has appeared proper to endeavour to reduce the aberrant forms which now exist to those from which, upon mature consideration, they may be presumed to have been derived, and to simplify the arrangement and discrimination of the species by confining them within their primitive limits As we think the latter to be the most simple principles of arrangement, and as they are certainly the most philosophical, we shall here follow those authors who have adopted them

It is usual in this class to distinguish the orders with two and three styles from that with five but the different species vary so much in the same genus in this respect, that we have only separated the genera into those with one style, Monogynia, with two, three, or five styles, Di-Pentagynia, and with many styles, Polygynia.

Order 1 MONOGYNIA.  Many perigynous Stamens. 1 Style



§ 1 *Ovary inferior*

1111. *Cactus* Cal imbricated. Petals numerous, in many rows the inner the largest Stigma many-cleft Berry many-seeded.

1112. *Rhipsalis* Cal 3-4-parted, very short Teeth acuminate, membranous, very fine Berry 1-celled, pellucid Seeds 12, in the centre

1113. *Bartonia.* Cal 5-cleft Petals many Caps cylindrical, 1-celled at the end with 3-5 lid-like valves. Placentas 3-5, parietal, bearing seeds in a double row

6835 Leaves ciliated, Offsets globose
6836 Leaves entire, Offsets spreading
6837 Leaves with entangled hairs, Offsets round
6838 Leaves rounded clavate clustered, Pedunc naked 1-fl Nects obcordate

and Miscellaneous Particulars

leek is a preservative to the coverings of houses in Smoland It may easily be made to cover the whole roof of a building, whether of tiles, thatch, or wood, by sticking the offsets on with a little earth or cow dung

---

1114 *Philadelphus* Cal 4-5-parted Petals 4-5 Style 4-cleft Caps half-superior, 4-5-celled, many-seeded Seeds with an arillus
1115 *Leptospermum* Cal persistent at base, 5-cleft, half-superior Petals 5, clawed, round, longer than stamens Stigma capitate Caps depressed, 4-5-celled Seeds angular, slender
1116 *Fabricia* Cal 5-cleft, half-superior Petals 5, sessile Stigma capitate Capsule many-celled Seeds winged.
1117 *Metrosideros* Cal 5-cleft, half-superior Petals 5 Stamens very long, separate Stigma simple Caps 3-4-celled
1118 *Psidium* Cal 5-cleft Petals 5 Berry soft, pulpy, many-seeded Cotyledons leafy, very small Radicle very large, arcuate Testa bony
1119 *Eugenia* Cal 4-5-parted, superior Petals 4-5 Fruit fleshy, 1-celled, 1-seeded Cotyledons half-cylindrical Radicle very small Testa membranous
1120. *Caryophyllus* Cal funnel-form Fruit dry, 1 or 2-celled Otherwise like Eugenia
1121 *Myrtus* Cal 5-cleft Petals 5 Berry 2 or 3-celled, many-seeded Radicle and cotyledons distinct
1122 *Calyptranthus* Cal truncate, before flowering covered with an hemispherical deciduous lid Cor O Berry 1-celled, 4-seeded
1123 *Pimenta* Cal 5-fid Petals 5 Ovary 2-celled Ovules solitary, appense Style straight Stigma somewhat capitate
1124 *Olyntha.* Cal 5-cleft Petals 5 Stigma hooked Berry 1-celled Seeds angular Embryo conferruminate
1125 *Stravadium* Cal 4-cleft Petals 4 Fruit 4-cornered, 1-seeded Flowers in terminal racemes Leaves alternate
1126 *Eucalyptus* Cal truncate, covered with an entire deciduous lid Cor O Capsule 4-celled, opening at end, many-seeded
1127 *Punica* Cal 5-cleft. Petals 5 Berry many-celled, many-seeded Seeds berried. Placentas parietal

§ 2 *Ovary superior*

1128 *Amygdalus* Cal 5-cleft Petals 5 Drupe with a nut perforated on its surface
1129 *Prunus* Cal 5-cleft Petals 5 Drupe with a hard smooth nut
1130 *Chrysobalanus* Cal 5 cleft Petals 5 Style lateral Drupe with a 5-furrowed, 5-valved nut

Order 2. DI-PENTAGYNIA  Many perigynous Stamens 2 to 5 Styles

§ 1 *Ovary inferior*

1131 *Mespilus* Cal 5-parted, with leafy divisions Disk large, honey-bearing. Styles smooth Apple turbinate, open, 5-celled, with a bony putamen
1132 *Crataegus* Cal 5 toothed Petals spreading, orbicular Ovary 2-5-celled Styles smooth Apple fleshy, oblong, closed by the teeth of the cal, or by the thickened disk Putamen bony
1133 *Pyrus* Cal 5-toothed Petals roundish Apple closed, 5-celled, with a cartilaginous putamen Cells 2-seeded Testa cartilaginous
1134 *Cydonia* Cal 5-parted, with leafy divisions Apple closed, many-seeded Testa mucilaginous
1135 *Photinia* Cal 5-toothed Petals reflexed Ovary half-superior, villous, 2-celled Styles 2, smooth Pericarp 2-celled, included in the fleshy calyx Testa cartilaginous
1136 *Raphiolepis* Cal. with a funnel-shaped deciduous limb Filaments filiform Ovary 2-celled Apple closed by the thickened discus, with a papery putamen Seeds gibbous
1137 *Eriobotrya* Cal woolly, bluntly 5-toothed Petals bearded Stamens erect, the length of teeth Styles 5, filiform, included, hairy Apple closed, 3-5-celled Chalaza none Radicle included between the bases of cotyledons
1138 *Amelanchier* Cal 5-toothed Petals lanceolate Ovary 10-celled Ovules solitary Apple 3-5-celled, with a cartilaginous putamen

1139. *Colonéaster* Flowers polygamous Cal turbinate, bluntly 5-toothed. Petals short, erect Stamens length of teeth Styles smooth, shorter than stamens. Achenopses parietal, included in calyx.

§ 2 *Ovary superior.*

1140 *Waldsternia* Cal 10-cleft, the alternate segments smaller Petals 5 Styles clavate, deciduous. Grains 2, obovate

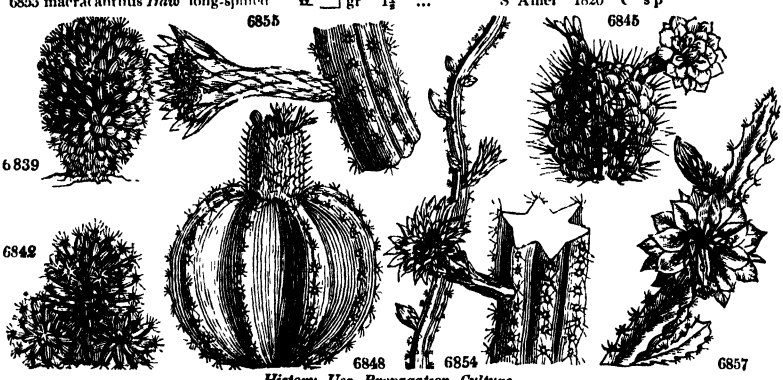
1141 *Spiræa* Cal spreading, 5-cleft Petals 5 Caps 1-celled, 2-valved, opening inwards, 1-3-seeded.

1142 *Gillenia* Cal. infundibuliform, 5-toothed Petals 5 Stamens very short. Capsule 5-celled

1143 *Sesuvium* Cal 5-parted, colored Petals O Caps ovate, 3-celled, cut round, many-seeded.

1144. *Aizoon* Cal. 5-parted. Pet. O Caps. 5-celled, 5-valved.

Order 3. POLYGYNIA. Stamens many, perigynous. Styles many



1145 *Tetragonia* Cal 3-5-parted Petals O Drupe inferior, with a 3-8-celled nut

1146 *Mesembryanthemum* Cal 5-cleft. Petals many, linear. Capsule turbinate, fleshy, inferior, many-seeded

1147 *Hymenogyne* Styles about 12, united in a delicate tube Caps. 1-celled, many-seeded Otherwise like Mesembryanthemum

History, Use, Propagation, Culture,

1111 *Cactus* A name under which Theophrastus describes a spiny plant, an article of food, which grew in Sicily This genus consists of succulent plants, permanent in duration, singular and various in structure, generally without leaves, and having the stem or branches jointed, for the most part armed with spines in bundles, with which, in many species, bristles are intermixed. These bundles of spines are placed on the top of the tubercles in the smaller melon thistle, which is tubercled all over, and produces its flowers between the tubercles In the great melon thistle the spines are ranged in a single row on the ridge of the ribs These are of an ovate or globular form The torch thistle, on the contrary, are slender, rise up high, are jointed and branched, many of them are almost cylindrical, with from five to ten shallow ribs, some, however, are square or three cornered The structure of the creeping Cereuses is the same with these, except that the stems are weak and cannot support themselves, they therefore seek support from trees, and throw out roots from the stem, like ivy In the Indian figs the branches are jointed, and flatted like the sole of a shoe, the bundles of spines or bristles are scattered over the surface, and the flowers are produced from the edge of the extreme branches In the Phyllanthus the branches are thinner, they are indented along the edge, and the flowers come out singly from the indentures This seldom has any spines. Pereskia has a round stalk with leafy branches, the leaves alternate, flat, and thick, the prickles are large and stiff, and come out in bundles on the stalk and branches, chiefly at the axils, the flowers are produced several together from the axils also. In this and the Indian figs the flowers are pitcher-shaped, in the other species they are subcylindrical and longer, in Phyllanthus very long The fruit in some of the sorts is small, like currants; but in most it is larger, and shaped like a fig, whence their name of Indian fig.

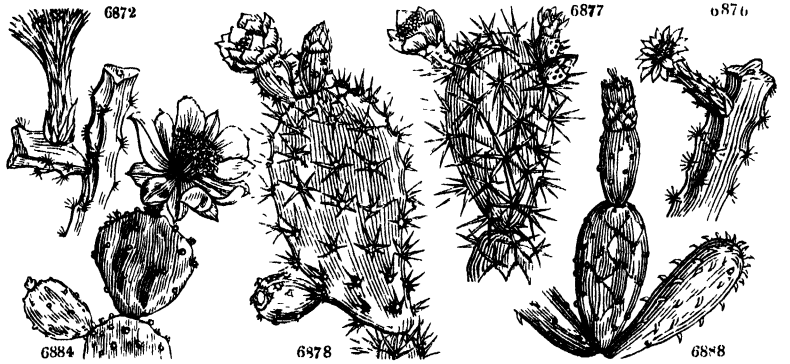
C. melocactus, the great melon thistle or Turk's cap, appears like a large fleshy green melon, with deep ribs, set all over with strong sharp thorns When it is cut through the middle, the inside is found to be a soft, green, fleshy substance, very full of moisture The flowers and fruit are produced in circles round the upper part of the cap. Some of those which have been brought to England, have been more than a yard in circumference, and two feet and half high including the cap But in the West Indies there are plants near twice as large. Linnæus observes, that this plant resembles a hedge-hog in its form and spines, and on the top has a discoid, convex, villous body, from which the flowers proceed.

1148 *Rosa* Cal. urceolate, 5-cleft, fleshy, contracted at orifice Petals 5. Grains bony, hairy, included in the fleshy tube of calyx.
1149. *Rubus* Cal 5-cleft. Petals 5 Berry composed of many cohering fleshy grains. Receptacle nearly dry
1150 *Dalibarda* Cal 5-cleft. Petals 5 Berry dry Styles 5, long, deciduous.
1151 *Fragaria* Cal 10-cleft Pet 5 Grains inserted upon a fleshy deciduous receptacle
1152 *Comarum* Cal 10-cleft Petals 5, less than calyx. Receptacle ovate, spongy, persistent.
1153 *Potentilla* Cal 10-cleft Petals 5 Grains rugose, roundish, naked, fixed to a small dry receptacle.
1154 *Tormentilla* Like Potentilla, but cal 8-cleft Petals 4
1155 *Geum* Cal 10-cleft Sepals unequal Petals 5 Grains generally with a jointed awn.
1156 *Kerria* Cal 5 cleft. Pet. 5, orbicular Ovaries 5-8, smooth, globose. Ovules solitary Styles filiform. Capsules globose
1157 *Calycanthus.* Stamens unequal, deciduous, the 12 outer fertile Grains many
1158 *Chimonanthus* Stamens equal, persistent, the 5 outer fertile, in maturity closing the orifice of the calyx by their united bases
1159 *Dryas* Cal simple, 8 cleft Petals 8 Grains with a hairy tail
1160 *Colurus* Like Sieversia, but the style jointed with the top of ovarium and deciduous, and the achenia glandular, included in the long turbinate tube of the calyx
1161 *Sieversia* Cal 10-cleft Petals 5 Stamens indefinite Ovaries indefinite, with an ascending ovule Styles terminal, continuous Achenia awned with the persistent style Embryo erect

MONOGYNIA.

6839 Roundish covered with ovate bearded tubercles
6840 Simple clavate, Tubercles ovate with woolly spines at end, Wool shorter than spines
6841 Roundish depressed with ten angles
6842 Proliferous, Warts small cylindrical, Spines fine whitish the lowest like hairs
6843 Roundish multiplex, Warts cylindrical bearded above furrowed proliferous
6844 Roundish deeply 16-angled, Angles with a remarkable swelling below each parcel of spines
6845 Warts large very green downy at end, Spines about 4 strong expanded
6846 Simple rounded obovate, Warts woolly at end with more than 20 spines
6847 Columnar, Warts small very numerous with little spines between, 2 in each parcel much longer than rest
6848 Roundish with about 14 angles
6849 Roundish with 15 angles, Spines broad recurved numerous
6850 Oblong with many angles, Angles and spines middle-sized straight
6851 Oblong with about 20 angles, Rays of spines capillary long
6852 Depressed spheroidal with about 21 angles, Rays of spines variable the lowest very broad flat deflexed
6853 Rounded bright green with 14 angles, Ribs straight with long thick white spines

and Miscellaneous Particulars



C melocactus, mammillaris, and proliferus, by many thought to be but one species, grow upon the steep sides of rocks in the hottest parts of America, where they seem to be thrust out of the apertures, having little or no earth to support them their roots shooting down into the fissures of the rocks to a considerable depth, so that it is troublesome to get the plants up As they delight in such rocky places, they seldom live long when transplanted into a better soil In times of great drought the cattle repair to the barren rocks where these plants grow, rip them up with their horns, tear off the outside skin, and greedily devour all the fleshy moist part The fruit is frequently eaten by the inhabitants of the West Indies. It is about three quarters of an inch in length, of a taper form, drawing to a point at the bottom, but blunt at the top: the taste is an agreeable acid

C repandus has a fruit about the size and shape of a Bergamot pear, having many soft spines on the skin; the outside is a pale yellow, the inside very white, full of pulp, having a great number of small black seeds lodged in it It frequently flowers in July, and in warm seasons will perfect its fruit, which has very little flavor in this country, but is frequently served up at table in the West India islands

The fruit of lanuginosus and peruvianus are also occasionally eaten where they are natives

C grandiflorus and flagelliformis have flowers remarkable for their beauty and sweetness C grandiflorus, when arrived to a sufficient strength, will produce many exceeding large, beautiful, sweet scented flowers, like most of this kind, of very short duration, scarcely continuing six hours full blown: nor do the flowers ever open again when once closed They begin to open between seven and eight of the clock in the evening, are fully blown by eleven, and by three or four in the morning they fade, and hang down quite decayed, but during their short continuance, there is scarcely any flower of greater beauty, or that makes a more magnificent appearance, for the calyx of the flower, when open, is near a foot diameter; the inside of which, being of a splendid yellow color, appears like the rays of a bright star, the outside is of a dark brown, the petals being of a pure white add to the lustre; the vast number of recurved stamens surrounding the style in the centre of the flower make a fine appearance add to all this the fine scent of the flower, which perfumes the air to a considerable distance. There is scarce any plant which deserves a place in the hothouse so much as this, especially as it may be trained against the wall, where it will not take up any room. The usual season of its

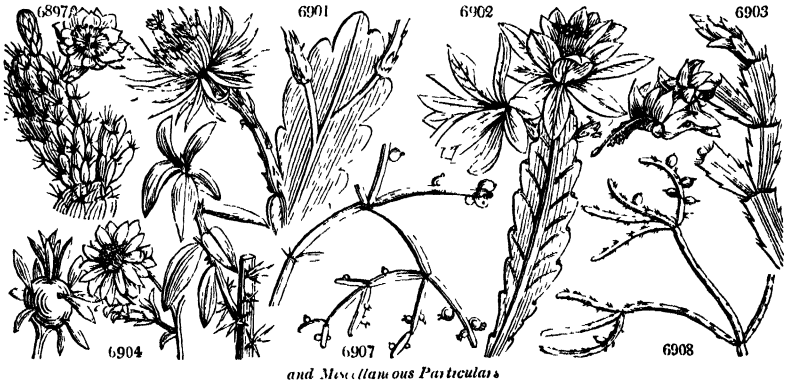
History, Use, Propagation, Culture,

flowering in July, and when the plants are large, many flowers will open the same night, and there will be a succession of them for several nights together Sometimes six, eight, or ten flowers open at the same time on one plant, making a most magnificent appearance by candle-light but none of them are succeeded here by any appearance of fruit,



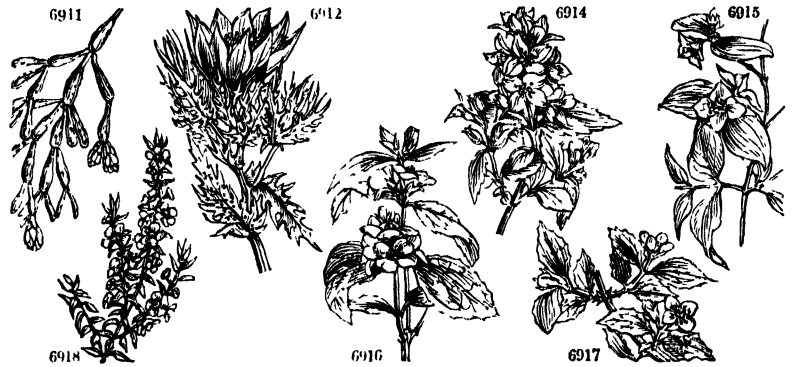
C. flagelliformis produces a greater number of flowers than the foregoing sort they come out in May, and sometimes earlier, when the season is warm The petals are of a fine pink color both within and without, they are not so numerous, and the tube of the flower is longer than that of the other These flowers keep open three or four days, provided the weather, or the place where the plants stand, be not too warm, and during their continuance they make a fine appearance This sort has very slender trailing branches, which require a support. they are not jointed, nor do they extend so far as those of the other sort Fruit sometimes succeeds the flowers, but seldom ripens

C triangularis, the strawberry pear, *Poirer de Chardon*, Fr, bears the best flavored fruit of any of the sorts, it is slightly acid, and at the same time sweet, pleasant, and cooling, in Martinique and other West India islands it is much esteemed

C opuntia, native of the country of the Opuntiani, whose chief town was Opus, in the vicinity of Phocis, though like the others a native of America, is now found growing wild on the sides of the roads between Rome and Naples and other parts of Italy, and even in the Valais Gerarde says, it was brought from Virginia into England, and Collinson had it from Newfoundland It was fruited in Scotland in a stove by

6854 Erect with deep furrows long with 6 distant angles
6855 Erect with deep furrows long with about 8 obtuse angles
6856 Erect with deep furrows long with 4 compressed angles
6857 Erect with deep furrows long slightly quadrangular with toothed angles
6858 Erect with deep furrows long jointed with about 5 angles
6859 Erect slender with shallow furrows jointed with 9 angles, Joints ovate, Spines as long as wool
6860 Erect slender with shallow furrows jointed with 9 angles not glaucous, Spines white, a variety of the last
6861 Erect slender with shallow furrows long with 9 obsolete angles, Spines shorter than wool
6862 Erect slender with shallow furrows long with 8 compressed wavy angles, Spines longer than wool
6863 Erect slender with shallow furrows, Branches jointed few bluntly triangular
6864 Erect slender with shallow furrows, Scarcely any Surface covered with variously imbricated lobed divisions
6865 Erect slender with shallow furrows black with numerous brown spines longer than the wool
6866 Erect slender with shallow furrows weak cylindrical, Surface covered with netted crossing furrows
6867 Erect rounded below long elegant with about 9 angles, Spines snow white weak, Wool very short
6868 Erect with 18 close obtuse angles with bristly yellowish spines longer than the wool
6869 Erect with deep furrows oblong with 7 angles
6870 Creeping triangular rooting
6871 Decumbent rooting 3-cornered, Spines fascicled divaricating seven two or three lines long
6872 Creeping rooting 3-cornered with scarcely channelled angles, Spines 5-7 in stellate fascicles
6873 Creeping rooting with about 5 angles
6874 Creeping 5-cornered with subulate spines longer than the wool
6875 Creeping rooting hispid with 10 angles
6876 Creeping with 3 or 4 angles which are scarcely channelled, Spines 5-7 in stellate parcels
6877 Erect, Joints broadly ovate-oblong, Spines subulate very long blackish
6878 Erect, Joints broadly ovate-oblong, Spines subulate long yellow
6879 Erect, Joints oblong and lanceolate, Spines of various shapes brownish black
6880 Joints oblong and ovate, Spines of various shapes yellow, Fl numerous solitary
6881 Stem rounded, Branches ovate compressed flat, Spines solitary or 3 together subulate strong
6882 Joints cuneate obovate decumbent, Spines variously shaped yellow
6883 Erect, Joints obovate roundish glaucous, Stigma 6-lobed
6884 Creeping prostrate, Joints ovate, Spines even numerous hair-shaped
6885 Erect, Joints ovate elliptical, Spines even numerous short
6886 Joints ovate oblong very thick, Spines unequal

6887 Jointed proliferous, Joints oval, Warts with a cluster of spines the length of the wool
6888 Joints ovate oblong unarmed
6889 Erect, Joints lanceolate-oblong, Clusters of spines fuscous weak with one strong white spine
6890 Erect, Joints oblong or oval, Spines numerous variable brown, one very long straw-colored
6891 Jointed proliferous, Joints ovate oblong with strong white spines longer than wool
6892 Nearly erect, Joints lanceolate with even short spines, Leaves 3 lines long
6893 Branches oblong with short soft hairs, Spines small
6894 Branches oblong scarcely spiny
6895 Joints very long slender compressed, Spines very long slender clustered white
6896 Joints oblong with numerous stiff spines of which one is very long and white at base
6897 Joints brittle cylindrical ventricose compressed much divaricating
6898 Joints brittle compressed short, Spines numerous variable white erect
6899 Jointed proliferous, Joints lanceolate-glaucous, Spines bristly longer than wool
6900 Joints brittle linear-lanceolate divaricating, Spines unequal
6901 Proliferous smooth branched ensiform compressed serrated with a central woody rib
6902 Branches ensiform compressed obovate with spreading teeth, Spines few setaceous longer than wool



and Miscellaneous Particulars

Justice, in 1750, and recently by Braddick, near London, in the open air This active horticulturist, having eaten with pleasure of the prickly pear in Virginia, was desirous of cultivating it here He recollected that the plant in its wild state delighted in a dry soil, amongst rocks, near the skirts of the sunny sides of the forests, and having heard that it would stand the open air in this country, he planted it in the compost described below, placed in a sheltered situation open to the sun "The first plant that I turned out has lived in the open ground of this country for six or seven years, during which period it has endured one exceeding hard winter, and several trying springs, and in all, except the two first years, it has never failed to ripen its fruit and seeds, so that it may be now considered decidedly acclimated The compost used by me for growing the Cactus Opuntia, is the following one half is carbonate of lime, for which lime-rubbish from old buildings will answer, the remaining half consists of equal portions of London clay and peat-earth, having the acid neutralised by barilla these are intimately blended and sifted One square yard of this compost I conceive to be sufficient for one plant, which must be placed in the middle of a small artificial hillock, raised eighteen inches above the surface of the ground, which ground should be rendered perfectly dry, if not naturally so, by under-draining Neither the leaves, flowers, nor fruit should ever be suffered to touch the ground, but they should as constantly as they are produced be kept from the earth by placing stones, pebbles, flints, or bricks under them, in imitation of artificial rock-work." (*Hort Trans* ii 238)

C Ficus indica is very common in Jamaica, and on it feed the wild sort of cochineal insect The fruit is large and of a deep purple color, and when eaten dyes the urine of a bloody color

History, Use, Propagation, Culture,

C tuna (*tyn* the Arabic name for fig) is used as a hedge plant in Spain, South America, and the West Indies When the island of St Christopher was to be divided between the English and the French, three rows of the tuna were planted by common consent between the boundaries (*Sloane*) Sir J E Smith informs us, that the stamens of the flower are very irritable, and that if a feather be drawn through them, in two or three seconds they begin to lie down gently on one side, and in a short time become recumbent at the bottom of the flower

C cochinillifer is the species on which the cochineal insect chiefly feeds The insect feeds on other succulent plants besides those of the Cactus genus, but this species is cultivated because least annoying by its prickles It produces an edible fruit larger than that of C opuntia On the top of the fruit there grows a red flower this when the fruit is ripe, falls down on the top of it, and covers it so that no rain or dew can wet the inside A day or two after, the flower being scorched up by the heat of the sun, the fruit opens wide, and the inside appears full of small red insects The Indians, when they perceive the fruit open, spread a large linen cloth, and then with sticks shake the plant, to disturb the insect, so that they take wing to be gone, but keep hovering over the plant, till by the heat they fall down dead on the cloth, where the Indians let them remain two or three days till they are dry The cochineal plants are called by the Spaniards Toona. They are planted in the country about Guatimala, Chiape, and Guaxaca, in the kingdom of Mexico

The difference, in point of goodness, observable in the cochineal, is entirely owing to the plant it feeds upon The prickly pear (C tuna) so abundant in Jamaica, is covered with the insects, but not having their proper food, they are in general diminutive, and have very little red tincture in their bodies The delicate red colored juice of the fruit is the natural food of the insect The exuviæ and animal salts of the insect are, from the minuteness of its parts, inseparable from the essential principles of the dye, and must diminish the brilliancy of the color and this has put some persons upon inspissating the juice of the fruit itself The ripe fruit is said to check fluxes by its mild restringency, it is also a powerful diuretic, and sometimes imparts a tinge to the urine

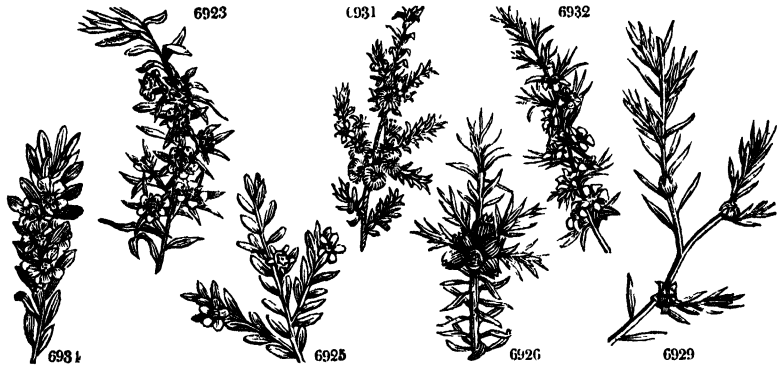
C pereskia, so called from the generic name of Plumier, who made this species a distinct genus, in memory of N. F Peiresk of Aix, whose name, as Tournefort says, is his only monument, has fruit about the size of a walnut, having tufts of small leaves on it, and within a whitish mucilaginous pulp

In our stoves, according to Sweet, "sandy loam, or loam mixed with a little brick rubbish, is the best soil for all the Cacti: the pots should be as small as the plants will allow, and well drained with potsherds They

6903 **Branched, Joints short oblong truncated**
6904 **Leaves elliptical fleshy, Spines about ¼ an inch long, Buds little woolly**
6905 **Spines numerous variable strong, Leaves lanc oblong with a strong rib beneath**
6906 **Leaves elliptical fleshy, Spines ¼ an inch long, Buds very woolly**

6907 **Branches pendulous whorled round smooth naked green**

6908 **Branches pendulous whorled round green the younger covered with bundles of white hairs**
6909 **Branches round as thick as a quill, Spines scarcely any**
6910 **Pendulous, Branches rounded fascicled, Hairs bundled in six lines**
6911 **Jointed erect, Branches round and angular, Young spines in minute inconspicuous parcels**



6912 **Ovary leafy, Seeds naked**
6913 **Ovary naked, Seeds winged**

6914 **Leaves somewhat toothed ovate oblong**

6915 **Leaves quite entire**
6916 **Leaves ovate acuminate toothletted, Axils of veins hairy, Stigmas 4 linear**
6917 **Leaves hairy oblong-ovate acute sharply and angularly toothed**

6918 **Leaves ovate mucronate obsoletely 3-nerved, Cal smooth with colored membranous teeth**
6919 **Leaves lin -lanc obtuse nerveless, Cal smooth with membranous naked teeth**
6920 **Leaves lanc lin acute 3-nerved, Cal silky villous, with membr colored naked teeth**
6921 **Leaves oblong or oval mucr pubescent on each side obsoletely 3-nerved, Branches villous, Cal very vill.**
6922 **Leaves lanc. oblong hairy oblique reflexed at end**
6923 **Leaves oval lanceolate, Young shoots colored, Flowers large. Teeth of calyx colored**
6924 **Leaves obovate nerveless, Branches and calyxes hairy with membranous colored teeth**
6925 **Leaves ovate lanceolate short three nerved, Fl sol sessile, Cal entire persistent**
6926 **Leaves subulate pungent, Branches hairy, Calyxes and teeth villous**
6927 **Branches flexuose, Flowers sessile fascicled, Cal hairy**
6928 **Leaves lin -lanc pungent, Branches silky, Cal smooth with membranous colored naked teeth**
6929 **Leaves lin -lanc pungent, Branches hairy, Cal smooth with membranous col pubescent teeth**
6930 **Leaves oblanc. densely dotted, Fl sol terminal, Sepals deciduous**
6931 **Leaves acicular rigid fascicled, Flowers solitary, Teeth of calyx colored**
6932 **Leaves linear recurved at end, Cal. smoothish, Teeth leafy lanc naked, Stamens longer than cor.**

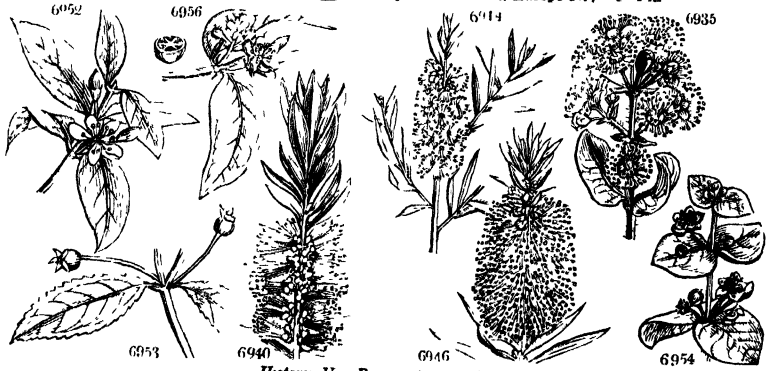
6933 **Leaves lanceolate obovate opp Teeth of calyx round**
6934 **Leaves obovate altern glaucous, Teeth of calyx triangular**

and Miscellaneous Particulars

require very little water The best way to flower them is to expose them to the air all the summer, which makes them get plump and throws them into flower-bud Most of the species are fine flowers Cuttings, after they are taken off, should be left to dry a few weeks till they are shrivelled, then potted, and they will root immediately (*Bot Cult* 31)

1112 *Rhipsalis* From ῥιπή, a willow branch, in allusion to the flexible decumbent branches of the genus Curious, branched, jointed, leafless, prostrate plants Culture as in Cactus

1113 *Bartonia* Named by Pursh, in honor of Dr B S Barton of Philadelphia, an American botanist Beautiful plants, with alternate pinnatifid rough glaucous leaves, and large white flowers, which open during the night, and spread a most agreeable odor Very rare, if they yet exist, in collections



1114 *Philadelphus* A name used by Athenæus for a tree which is now unknown Bauhin applied it to this genus The species are free flowerers, well adapted for the shrubbery The native country of P coronarius is not known, it is generally referred to the south of Europe, but it has only been found twice in Italy, and then in situations where it might have been planted The flowers have the appearance and odor of those of the orange, but the odor in near contact is much more powerful Seeds are seldom produced in this country The leaves taste like fresh cucumbers P grandiflorus is a very shewy plant. All the species grow freely in common soil, and are increased by layers

1115 *Leptospermum.* From λεπτος, slender, and σπερμα, seed, in allusion the extreme tenuity of the seeds. Pretty New Holland plants L scoparium grows commonly in dry places near the shores in New Zealand, and the underwood in Adventure Bay, Van Dieman's Land, chiefly consists of this shrub. The leaves were used by Captain Cook's ships' crews as tea, whence they named it the tea plant. The leaves have a very agreeable bitter flavor, with a pleasant smell, when fresh, but lose something of both, when dry If the infusion was made strong, it proved emetic to some, in the same manner as green tea. It was also used with spruce leaves, in equal quantity, to correct their astringency in brewing beer from them, and they rendered the beer exceedingly palatable

Young cuttings of all the species will root readily in sand, under a bell-glass; the species may also be raised from seeds, but plants from cuttings are best, as they flower young, and the seedlings do not flower till they attain a considerable size (*Bot Cult* 214)

1116 *Fabricia.* Dedicated by Gærtner to John Christian Fabricius, the famous Entomologist. The species

History, Use, Propagation, Culture,

requiring to grow to a good size before they produce flowers are well adapted for a conservatory. the culture and propagation as in Leptospermum

1117 *Metrosideros* From *μητρα*, the heart of a tree, and *σιδηρον*, iron, in allusion to the hardness of the wood One species (M vera) is called iron wood The Chinese make their rudders and anchors of it, and among the Japanese it is so scarce and valuable that it is only allowed to be manufactured in the service of their king The bark is used as a remedy for fluor albus and diarrhœa, being mixed with Pinang, and a small quantity of cloves and nutmegs This is a genus distinguished at sight by the peculiar character of the shrubs of Australasia, with both sides of the leaf alike M hispida, lanceolata, and speciosa, are beautiful plants, but not tree flowerers They are rather difficult to strike Sweet recommends "ripened wood planted under a bell-glass in sand"

1118 *Psidium* One of the Greek names of the Pomegranate In English it is called *Guava*, a corruption of the American name *Guayaba* Most of the species are cultivated in the tropics for their fruit, which also ripens freely in this country, though it is of little merit P pyriferum bears fruit the size of a hen's egg, yellowish, with a peculiar smell The rind is brittle and fleshy, pulp rather firm, full of bony seeds, flesh colored, sweet, aromatic, and pleasant In the West Indies it is eaten with avidity, not only by the natives, but by Europeans with those who are not accustomed to it, the Guava is apt to occasion a slight flux, but Jacquin affirms, that when he has been thirsty on a journey he has eaten of it to satiety without suffering any harm It is eaten raw in the dessert, but the seeds are scarcely separable It is also preserved with sugar. P. pomiferum has fruit like a pomegranate, which is seldom eaten, though eatable, and being astringent is counted strengthening for the stomach P Cattleianum is reckoned one of the best of the Guavas, the fruit is of a fine deep claret color, and the pulp in consistence and flavor bears a considerable resemblance to the strawberry

All the species are of easy culture in light and rather rich loam, and are increased readily by seeds, layers, or cuttings in sand under a hand-glass

6935 Leaves opposite cordate at base stem-clasping, Branches calyxes and peduncles hispid
6936 Leaves opposite stalked ovate lanceolate, Panicle brachiate, Pedic umbelled
6937 Leaves opposite stalked lin-lanc acuminate oblique, Panicle brachiate decompound
6938 Leaves opposite ovate netted veiny beneath pubescent, Heads lateral stalked and bractes downy
6939 Leaves opposite lin-lanc naked, Pedunc axillary umbelled, Bractes lanc smooth
6940 Leaves alternate lanceolate 3-nerved, Fl racemose clustered terminal smooth
6941 Leaves scattered linear channelled acute rigid, Fl lateral clustered sessile
6942 Leaves alternate lin filiform rigid mucronate channelled rough, Fl. clustered sessile
6943 Leaves alternate linear-lanceolate, Fl clustered lateral pubescent
6944 Leaves alternate lanceolate narrowed at each end mucronate, Fl lateral clustered sessile smooth
6945 Leaves alternate lanceolate mucronate, Fl lateral clustered sessile pubescent
6946 Leaves scattered lanceolate veiny glandular mucronate, Caps downy at end
6947 Leaves ovate-lanceolate acuminate quite smooth, Cymes stalked many-flowered
6948 Very like M lanceolata, but the blossoms appear more copiously
6949 Leaves alternate lin-lanceolate with a long acute point
6950 Leaves lin-lanceolate with a long point dotted rough

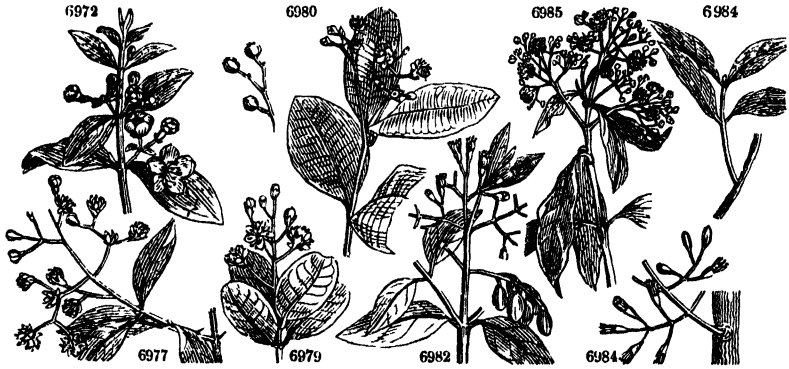
6951 Leaves elliptical pubescent beneath, Peduncles 1-flowered
6952 Leaves oblong lanceolate pubescent beneath, Peduncles 3-flowered
6953 Leaves oblong acuminate smooth, Peduncles 1-flowered
6954 Leaves sessile cordate rounded smooth on each side, Pedunc 1-fl. clustered
6955 Leaves oblong acuminate crenulate shining, Peduncles many-fl
6956 Leaves ovate oblong acute sub-crenate, pubescent above rugose beneath, Branches reclinate
6957 Leaves obovate smooth coriaceous, Fruit purple

6958 Leaves entire oblong, Peduncles 4-fl lateral
6959 Leaves entire lanceolate, Pedunc 4-fl terminal
6960 Leaves entire ovate-lanceolate, Ped many-fl axillary shorter than petiole
6961 Leaves elliptical, Pedunc trichotomous lateral and terminal, Stamens much longer than petals

6962 Leaves entire oblong acuminate obtuse flat, Pedunc axill many-fl the length of petioles
6963 Leaves entire roundish ovate obtuse, Pedunc axill many-fl trichotomous the length of leaves
6964 Leaves entire oblong-lanceolate acuminate, Pedunc axillary many-fl racemose shorter than leaf
6965 Leaves entire elliptical acuminate, Pedunc panic axill and terminal, Fruit globose
6966 Leaves entire lanceolate narrowed at base obtuse veinless, Pedunc 1-fl solitary terminal
6967 Leaves entire ovate-lanceolate, Pedunc 1-flowered solitary lateral
6968 Leaves entire oblong acuminate coriaceous not dotted, Pedunc 1-fl filiform
6969 Leaves entire ovate oblong acuminate netted with veins, Pedunc 1-fl. about 3 in fruit nodding

6970 The only species

6971 Flowers solitary, Involucre 2-leaved
α Leaves ovate longer than the peduncles
β Leaves ovate with round berries



and Miscellaneous Particulars

1119. *Eugenia* In honor of Prince Eugene of Savoy, who was a protector and encourager of botany, and possessed a botanic garden. Some of the species bear edible fruits. that of E. malaccensis is ovate, an inch and a half in diameter, flesh smelling like the rose, agreeable to the taste, and wholesome. It is generally cultivated between the tropics E Jambos bears smaller fruit, edible, but not so much esteemed, it is nevertheless excellent, resembling in appearance and flavor a Brussels apricot, and produced in great abundance in the stove All the species grow freely in two-thirds loam and one-third peat, and flower abundantly when the plants are of a good size Ripened cuttings strike root freely in sand under a hand-glass.

1120 *Caryophyllus* The Arabs, who have been acquainted from all antiquity with the clove, called it *qarunfel*, which the Greeks altered into *Caryophyllon* *Girofliier*, Fr. The fruit is thought to bear some resemblance to a nail, and hence is called clove, *clou*, Fr, *Chiode*, Ital, *Clavo*, Span, *Naghel*, Ger. and Dutch The whole tree is aromatic, and the fruit or clove is considered as one of the hottest and most acrid substances of the aromatic class, and as such is often used, not only internally, but externally, as a stimulant, as in paralytic cases for example, in which the oil of cloves has been administered to advantage. it is also made use of in the tooth ache, in which it often succeeds in suddenly abating and subduing the pain A tincture of cloves in rectified spirit is kept in the shops, as well as the essential oil, which latter is perhaps seldom free from sophistication For culinary purposes, the uses of cloves are innumerable. The Dutch, who had for a long time the monopoly of the spice trade, prevented while they could the tree from being removed from the Moluccas and other islands, where it grows naturally, but the French now cultivate it in Cayenne and St. Domingo There are a few specimens in the British gardens It grows freely in loam and peat, and ripened cuttings are not difficult to root in sand, in moist heat under a hand-glass.

1121 *Myrtus* From *μυρον*, perfume. *Μυρτος* of the Greeks. *Le Mirte*, Fr, *Myrte*, Ger, *Myrtus*, Dutch, *Mirto*, Ital and Span, *Myrta*, Portug, *Myrtel*, Dan. and *Myrten*, Swed The common myrtle is a well known popular shrub, which has been in English gardens for an unknown length of time, evidently from

History, Use, Propagation, Culture,

what Gerarde and Evelyn say, before the invention of greenhouses, and probably in that case preserved by covering or housing in rooms It was a great favorite among the ancients, for its elegance, and its evergreen sweet leaves It was sacred to Venus, either on this account, or perhaps because it flourishes most in the neighbourhood of the sea Myrtle-wreaths adorned the brows of bloodless victors, and were the symbol of authority for magistrates at Athens Both branches and berries were put into wine, and the latter were used in the cookery of the ancients The myrtle was also one of their medicinal plants All parts of it are astringent, but it is discarded from modern practice

M. coriacea, sometimes called wild cinnamon, is a most elegant tree, with a handsome ash-colored straight trunk, and pyramidal head It grows slowly, and flowers late twice a year In old trees, the bark becomes white, and hangs down in shreds which have an aromatic quality The timber is red, very hard, and used in mill-work The berries, which are the size of peas, and of an agreeable aromatic smell and taste, are used in culinary purposes.

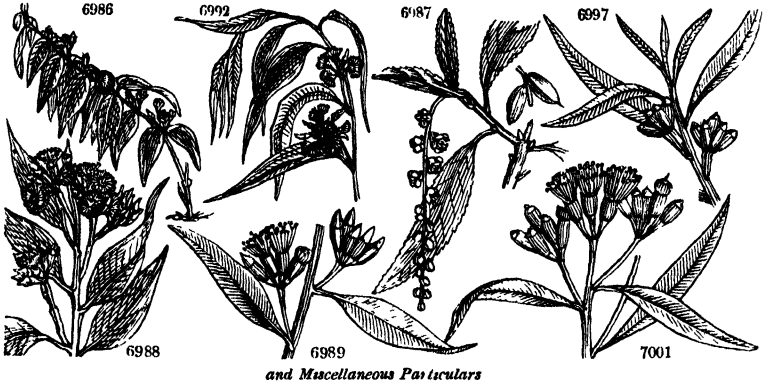
1122 *Calyptranthes* From καλυπτρον, a lid, and ανθος, a flower, in allusion to the peculiar manner in which the segments of the calyx, being grown together, fall off

Zuzygium, is so called from συζυγος, coupled, in allusion to the manner in which the branches and leaves are united by pairs. C Jambolana, frequently called the Java plum, bears a black esculent berry. Cuttings of this genus, Sweet observes, "do not strike freely, ripened ones strike best in sand under a bell-glass, but the plants root best from layers" (*Bot Cult* 34)

1123 *Pimenta* A genus readily distinguishable from Myrtus by the structure of its ovarium. It is a handsome tree, common in the hilly parts of the north side of Jamaica The flowers are without shew, and are succeeded by spherical purple berries crowned with a persistent calyx: they are called Jamaica pepper or all-spice, from their taste being thought to resemble a composition of all other spices The berries are gathered before being ripe, and are carefully dried on mats or terraced floors in the shade. In ten or twelve

γ Leaves ovate-lanceolate acute
δ Leaves ovate-lanceolate close together
ε Leaves lanceolate ovate acute
ξ Leaves lanceolate acuminate
η Leaves lin.-lanceolate acuminate. Very small

6972 Peduncles 1-flowered, Leaves 3-nerved downy beneath
6973 Peduncles 2-flowered, Leaves lanceolate
6974 Peduncles about 3-fl Leaves subsessile lanceolate attenuated
6975 Racemes axillary very short, Leaves stalked broad lanceolate acuminate
6976 Peduncles axillary many-fl Leaves ellipt. acute entire pubescent beneath
6977 Racemes lateral and terminal, Leaves broad lanceolate attenuated
6978 Peduncles axillary terminal and corymb trichotomous, Leaves ellipt convex coriaceous veiny dotted
6979 Peduncles 3-chotomous terminal, Leaves roundish elliptical convex coriaceous veinless dotted
6980 Leaves elliptical flat with close parallel transverse veins, Cymes stalked few-flowered shorter than leaves



6981 Pedunc axillary 3-chotomous spreading, Leaves ovate obtuse, Branches dichotomous
6982 Panic subterminal, Leaves ovate emarginate
6983 Peduncles terminal panicled trichotomous downy, Leaves ovate attenuated at end
6984 Panicles lateral, Leaves elliptical ovate entire

6985 Flowers trichotomous panicled, Leaves oblong lanceolate acuminate

6986 Leaves distichous deflexed ovate-lanceolate

6987 Leaves crenate, Raceme very long, Drupe ovate

6988 Lid conical contracted in middle broader than calyx, Leaves ovate
6989 Lid rostrate, Umbels lateral, Leaves ovate-lanceolate attenuate oblique
6990 Leaves linear lanceolate, Lid conical contracted in middle, Umb lateral
6991 Lid conical rounded very smooth membranous, Umb lateral solitary
6992 Lid conical rounded coriaceous twice as long as calyx, Umb lateral solitary
6993 Leaves ovate thickened at edge, Umbels lateral
6994 Leaves ovate-lanceolate, Heads lateral solitary, Fruit globose
6995 Leaves lin.-lanceolate, Heads lateral solitary, Fruit turbinate
6996 Lid hemispherical obtuse, Heads lateral solitary, Fruit turbinate
6997 Heads lateral solitary, Pedunc cuneate compressed, Fruit turbinate
6998 Umb lateral and terminal, Pedunc compressed, Branches angular
6999 Pedunc. compressed, Branches angular, Umbels lateral panicled or solitary
7000 Pedunc. and branches round, Umb lateral solitary
7001 Umb corymbose panicled terminal, Calyx round, Lid hemispherical mucronulate

and Miscellaneous Particulars

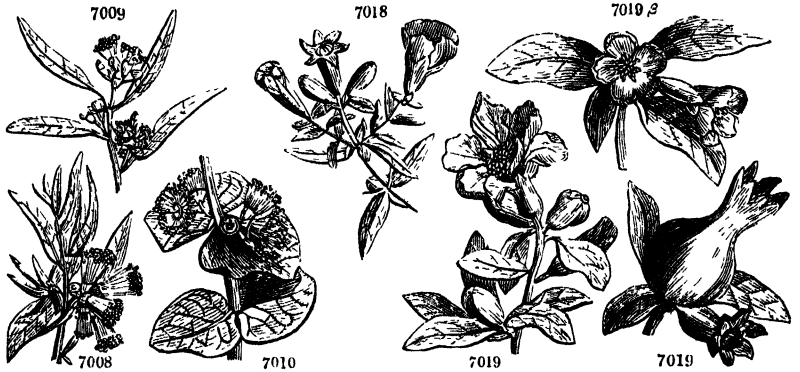
days they become wrinkled, dry, and of a dark brown color, and are then packed in bags or casks for sale. Some kiln-dry them by which the same object is sooner effected The berries have an agreeable aromatic subastringent taste, resembling that of a mixture of cinnamon, cloves, and nutmegs, with the warm pungent taste of the cloves, qualities which reside chiefly in the cortical part of the dried berry, and are better extracted by a watery infusion, than by spirit or distillation They are much used in the kitchen, and also by the druggists to cover the disagreeable taste of other remedies, or to give them warmth An oil is obtained by distillation which is said to be nearly equal to that of oil of cloves, and sometimes substituted for it

1124 *Olynthia.* So named from ὀλυνθος, a little fig or berry. A genus separated from Myrtus on account of the singular manner in which all the parts of the seed are consolidated. A small stove plant common in collections.

1125. *Stravadium.* The Malabar name of this plant is *Tyera samstrawadi*, from which Stravadium has been contrived A fine tree with racemose flowers, and large, four-cornered, oblong fruit. A delicate stove plant rarely seen

1126. *Eucalyptus* From ω, well, and καλυπτω, to cover as with a lid; a name, therefore, with the same meaning as Calyptranthes, No 1122 This genus consists of the loftiest timber trees of New Holland Botanists knowing them principally from dried specimens, their respective heights cannot be stated correctly They are all of the tallest habit, and soon grow beyond the limits of our stoves. In Van Dieman's Island a manufactory has been established for the preparation of extract of tannin from the bark of various species of Eucalyptus. A considerable quantity of the substance has been imported into England recently, and it is said to have been found by the tanners to be twice as powerful in its operation as oak-bark.

E. resinifera produces a gum resin something like the Kino of druggists (obtained from a species of Pterocarpus), and for all medical purposes full as efficacious.



All the species, Sweet observes, "are fine plants for a large conservatory, as they grow very fast, and are

History, Use, Propagation, Culture,

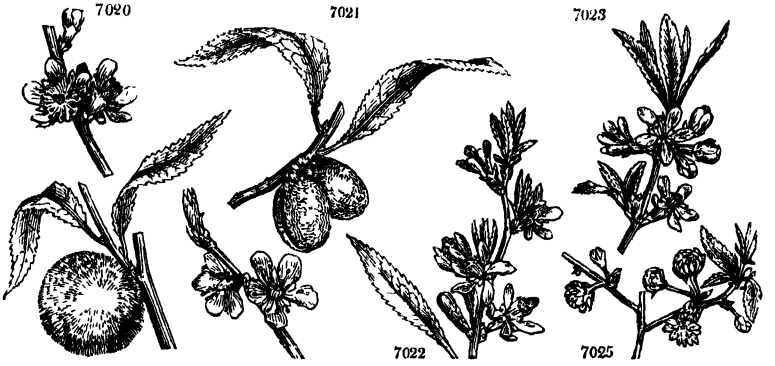
generally well clothed with beautiful foliage, they will also flower freely, when of a moderate size. The best soil for them is a mixture of loam and peat, and cuttings of them may be struck in sand under a bell-glass, but they are not so free to root, as most of this natural order are (*Bot Cult* 189)

1127 *Punica* This fruit was called by the ancients *Malum Punicum*, Carthaginian apple, because, as Pliny tells us, the tree was first known to grow in the vicinity of Carthage Hence has the term Punica been constructed. P nana has very small fruit and flowers, and is used in the West Indies as a hedge-plant, as P Granatum (from *granum*, grain, on account of the numerous grains of its fruit) is in the south of France and in Italy The latter, in its wild state, is a thorny bush not unlike our hawthorn the flowers have a fine appearance, and the fruit is very ornamental It will produce fruit, trained against a south wall, in many parts of England, and under a glass case, or against a flued wall, it is probable, the fruit might be as highly flavored as that imported from Genoa and Leghorn The flowers come out at the ends of the branches, singly, or three and four together, and, therefore, in pruning, care must be had to bring into action only the strongest buds For this purpose, all the weak shoots should be cut out, and the stronger ones shortened, so as to produce bearing-shoots over the whole tree The best soil is a rich strong loam

The double-flowering varieties are to be treated in the same manner, and are highly ornamental.

1128 *Amygdalus* The Greek name of the almond The species are fruit-trees, or ornamental trees and shrubs, both much esteemed for the gay color and early appearance of their flowers A Persica, the peach and nectarine, bears the most exquisitely delicious of European fruits, it is more gratifying to the palate by its mass of juicy pulp than the grape, and more delicate than the melon Some, however, prefer the grape and melon to the peach and nectarine, but the most delicate of taste consider the latter as surpassed only by the pine-apple The varieties of peach and nectarine are numerous, and by raising from seed might easily be rendered innumerable. The best varieties have been raised in France, at Montreuil, a village of peach growers for the Paris market. Some good varieties have been raised in England by Mr Knight, and other members of the Horticultural Society The peach, to attain its proper flavor, must be protected by glass during the spring and earlier summer months, and exposed to the direct influence of the weather during the ripening process Ripened under glass, unless very liberal supplies of air are given, the flavor will be very inferior Mr Knight considers that the direct rays of the sun (without the intervention of glass) are of great advantage to the proper ripening, and essential to the coloring of the peach

Linnæus divides the A Persica into two varieties, that with downy fruit, or the peach, and that with smooth fruit, or the nectarine. There are various instances on record (*Hort Trans* vol 1 p 103) of both fruits growing on the same tree, even on the same branch, and one case has occurred of a single fruit partaking of the nature of both. The French consider them as one fruit, arranging them in four divisions, the *pêches*, or free-stone peaches, the flesh of whose fruit separates readily from the skin and the stone, the *pêches lisses*, or free-stone nectarines, or free-stone smooth peaches, the *pavies*, or cling-stone peaches, whose flesh is firm, and adheres



7002 Lid hemispherical obtuse, Cal angular, Umb. panicled terminal
7003 Lid very long and cornute, Heads lateral solitary, Style persistent 3-4-fid at base, Leaves lin. lanceolate
7004 Leaves lanceolate subfalcate acuminate subovate at base oblique netted with veins beneath
7005 Leaves lanceol unequal at base, on one side rounded with an incurved point, Branches axillary many-fl.
7006 Leaves lanceolate with a long point at the base subovate oblique with parallel nerves beneath
7007 Leaves lanceol. with a short point wavy with parallel nerves beneath and a marginal nerve on both sides
7008 Leaves obl. unequal at base attenuated somewhat falcate with axillary 3-fl peduncles and sessile flowers
7009 Leaves lanceolate stalked, Pedunc. short axillary 6-12-flowered
7010 Leaves amplexicaul with a short point glaucous beneath
7011 Leaves lanc attenuated with a filiform point netted with veins beneath
7012 Leaves acute reticulated, the nerves united at the margin
7013 Leaves falcate at end, those on the branchlets small clustered
7014 Leaves linear narrowed at base obtuse veiny with nerves united on this side the edge
7015 Leaves 6 lines long and 1½ broad with the lateral parallel nerves united on this side the edge
7016 Leaves stalked cordate obtuse with nerves downy beneath, Branches and peduncles strigose
7017 Leaves amplexicaul. lanceolate with a long point glaucous beneath

7018 Leaves linear, Stem shrubby
7019 Leaves lanceolate, Stem arborescent

7020 Leaves with all the serratures acute, Flowers sessile solitary

7021 Lower serratures of the leaves glandular, Flowers sessile in pairs

7022 Leaves ovate attenuate at base simply and finely serrate
7023 Leaves oblong lanceolate serrate downy beneath
7024 Leaves lanceolate entire silvery perennial shorter than footstalk
7025 Leaves lanceolate doubly serrated

and Miscellaneous Particulars

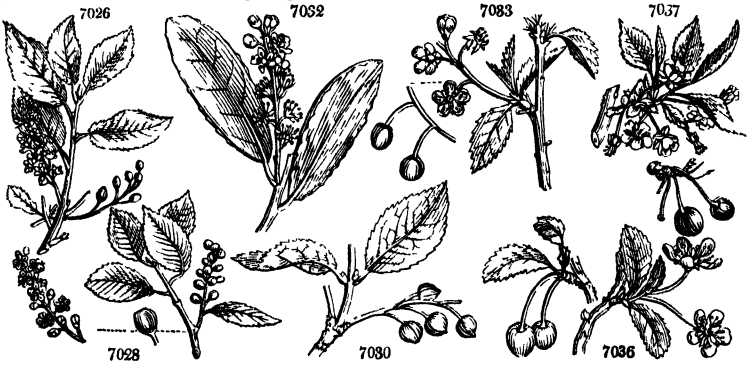
both to the skin and stone, and the *brugnons*, or nectarines, or cling-stone smooth peaches *Knight* (*Hort Trans* iii 1)

The double-blossomed peach is one of the most ornamental of spring-flowering trees, its blossoms appear about three weeks later than those of the common peach

A communis and amara, and especially the former, are employed as ornamental trees in front of shrubberies, and in suburban gardens In the south of France, Italy, Spain, and different parts of the Levant, they are cultivated for their fruit. In France they have above a dozen species or varieties, besides a hybrid called the almond-peach (See *Duhamel*) The common and bitter almond are only to be distinguished by the taste of the kernels of their fruit. The Jordan almonds, which come from Malaga, are the best sweet almonds brought to England, the bitter come chiefly from Magadore The bitter cuticle of almonds is taken off by immersion in boiling water The almond eaten as food is not very digestible, and requires to be well masticated

Robertson (*Hort. Trans* iii 382) and various botanists consider the peach and almond as one species

Four distinguished and ingenious attempts have been made to class the varieties of peaches and nectarines by the leaf and flower as well as the fruit the first is by Poiteau, in the Bon Jardinier, the next by Count Leheur, in his Pomone Française, the third by Robertson, nurseryman, of Kilkenny, whose arrangement is founded on the glands of the leaves, and the fourth, and most important, by Mr George Lindley, in the fifth volume of the Horticultural Society's Transactions The latter writer has, in a peculiarly distinct manner, arranged no fewer than 155 sorts of peaches and nectarines in well defined divisions or sections.



The bitter almond contains less fixed oil, than the sweet almond, and a portion of prussic acid or hydrocyanic acid, upon which its narcotic power is supposed to depend This variety is said to operate as a poison on dogs and some other animals, but not generally on the human species The distilled water exerts an action not less deleterious than that of laurel water on the human frame It produces vertigo, head-ache, tinnitis aurium, dizziness of sight, and vomiting, when taken to the extent of thirty drops only, and a drachm of it has killed a stout dog. When a large doze is taken, death almost instantly follows. In order to counteract its poisonous effects recourse is had to diffusibles, as brandy and ammonia, or three or four spoonfuls of oil of turpentine may be given at intervals of half an hour The fixed oil, which both varieties of the almond yield by expression in large quantity, is insipid and inodorous when heat has not been employed.

Sweet almonds are used more as food than as medicine, but they afford little nourishment. Heartburn is said to be relieved by eating six or eight of them decorticated. When triturated with water, milky mixtures or emulsions are formed, and they are also used in pharmacy for assisting, by trituration, the combination of substances, such as camphor and the resins with water Bitter almonds are scarcely ever used medicinally. (*London Dispensatory*, 151)

A. nana and pumila are very ornamental shrubs, both in their double and single varieties.

Rosaceæ Sp. 33—47.

History, Use, Propagation, Culture,

1129. *Prunus* The origin of this name is wholly unknown The Greeks called it *προυνη*, and the Latins *prunus* From this genus have been obtained the principal characters of that section of the natural order Rosaceæ, which is called Amygdaleæ or Prunaceæ, and which is curiously and chemically known by the presence of Prussic acid all in the species, and in all their parts

P Padus (a name of Theophrastus), the bird-cherry, is an ornamental tree, by its purple bark, leafy bunches of white flowers, and berries successively green, red, and black It is common in the native woods of Scotland and Sweden, and in both countries the berries are infused in spirits in order to give them an agreeable flavor. The fruit is nauseous to the taste, though greedily eaten by birds. The bark is used by the Finlanders to cure venereal complaints, and also with success by regular practitioners in Stockholm for the same purpose (*Stockholm Acts*) The tree is very leafy, and dislikes a wet soil, but bears lopping as copsewood. The wood is beautifully veined, and used for cabinet work in France, as is that of P virginiana in America.

P rubra greatly resembles P Padus P carolinıana is an imperfect evergreen

P. Lauro-cerasus is one of our most popular evergreens It was first brought from Constantinople to Holland in 1576, the first we read of in England was one at Highgate, in the garden of Mr James Cole, a merchant of London, who, as Parkinson informs us, used to cover it in winter with a blanket. In less than half a century afterwards (1688), Ray informs us, the laurel was common in English gardens It is now as universal in shrubberies as the rose The kernel-like flavor of the fresh leaves has led to their use in flavoring custards and other culinary preparations, but as these leaves are poisonous, they ought to be used with caution To brute animals the effect of the distilled water of laurel leaves is almost instant death; and two women in Dublin, and Sir T Boughton in England, have been poisoned by it

P lusitanica is a most beautiful evergreen shrub, nearly as universal as the lauro-cerasus. It was brought to England from Portugal, but does not appear to be a native of that country; probably of Madeira or some other islands possessed by the Portuguese in the sixteenth or seventeenth centuries

P Mahaleb (*Mahhaleb* the Arabic name) flowers profusely, and disperses an odor resembling that of Clematis for a considerable distance around Its fruit is round, shining black, and so hard that it has been bored for beads by the catholics The wood is perfumed and used by the French in cabinet-work, especially in the village of St. Lucie, near Commercy, whence, among the French, the plant has obtained the name of *Bois de St Lucie*

P. Cerasus, the cultivated cherry, is by some considered a distinct species, and by others only a variety of P. avium, the gean or wild black cherry Lucullus is said to have first introduced the cultivated cherry to Italy, in 73 A. C from a town in Pontus in Asia, called Cerasus, whence its specific name, and it was introduced to Britain 120 years afterwards Many suppose that the cherries introduced by the Romans into Britain were lost, and that they were re-introduced in the time of Henry VIII by Richard Haines, the fruiterer to that monarch. But though we have no proof that cherries were in England at the time of the Norman conquest, or for some centuries after it, yet Warton has proved, by a quotation from Lidgate, a poet who wrote about

7026 Flowers racemose, Racemes pendulous, Lvs. decid. doubly serrat somewhat rugose, Petioles with 2 glands
β Serratures of leaves less, Racemes more erect
7027 Flowers racemose, Racemes erect, Leaves deciduous doubly toothed smooth, Stalks with 4 glands
7028 Flowers in loose racemes, Lvs. decid simply serrated lower serratures glandular, Rib beard towards base
7029 Flowers in lateral racemes, Leaves without glands oblong acuminate entire smooth on each side
7030 Flowers racemose, Racemes lateral, Leaves evergreen without glands oblong acuminate entire
7031 Flowers racemose, Leaves evergreen ovate-lanceolate serrated without glands
7032 Flowers racemose, Leaves evergreen with two glands at back
7033 Flowers corymbose terminal, Leaves ovate
7034 Umbels sessile aggregate few-flowered, Cal acute, Branches virgate round, Leaves narrow lanceolate
7035 Umbels sessile aggregate few-fl Sepals lanc Stipules setaceous compound, Lvs. obl. oval suddenly pointed
7036 Umbels sessile, Leaves obovate obtuse smooth with glandular serratures
7037 Umbels somewhat stalked, Leaves ovate-lanceolate smooth folded together
7038 Leaves obovate acuminate flat serrated, Racemes pubescent
7039 Flowers racemose, Calyxes serrated, Leaves ovate serrated glandular at base
7040 Umbel sessile, Leaves ovate-lanceolate pubescent beneath folded together
7041 Umbel subsessile aggregate many-fl at length panicled, Leaves obl lanceolate serrated smooth
7042 Umbel sessile solitary few-fl Leaves deciduous ovate acuminate finely serrated, Petioles with 2 glands
7043 Peduncles solitary, Leaves ovate acuminate smooth, Branches unarmed
7044 Fl. lateral clustered, Leaves doubly serrated roundish acute
7045 Peduncles subsolitary, Leaves lanceolate ovate convolute, Branches not spiny
7046 Peduncles twin, Leaves ovate villous beneath convolute, Branches spiny
7047 Peduncles solitary, Leaves elliptical smooth, Fruit pendulous, Branches nearly unarmed
7048 Umbel sessile clustered few-fl Cal obtuse, Branches angular prostrate, Lvs cun lanc glaucous beneath
7049 Buds clustered 2-fl Ped very short, Cal smooth, Leaves oblong acum serrulate, Branches spiny
7050 Pedunc. subsolitary, Leaves ovate-oblong acuminate doubly serrated
7051 Peduncles solitary, Leaves obovate obl beneath glaucous serrated entire at base
7052 Peduncles solitary, Leaves ellipt lanceolate pubescent beneath, Branches spiny
7053 Peduncles twin, Leaves ovate cut serrate without glands beneath white, Stem prostrate
7054 Flowers corymbose, Ped elongated, Leaves oval oblong eroded membranous smooth
7055 Umbels sessile aggregate few-fl Leaves ovate ellipt acute smooth on each side with 2 glands at base
7056 Flowers sessile, Leaves subcordate

and Miscellaneous Particulars

or before 1415, that the hawkers in London were wont to expose cherries for sale in the same manner as is now done early in the season The tree is now very generally cultivated both as a wall and standard fruit, and has been forced for upwards of two centuries

The Romans had eight varieties of cherry in the British gardens are upwards of forty sorts The French divide their cherries into *griottes*, or tender-fleshed, *bigarreaux*, or hard-fleshed, and *guignes*, or small fruits The fruit of many varieties is somewhat heart-shaped, hence the very general cognomen, why some sorts are called dukes is not as obvious The Morello cherry is very distinct from the other varieties, bearing almost exclusively on the preceding year's wood, and the pulp of the fruit having the consistence and flavor of the Morel, whence the name Cherries are grafted or budded on seedlings from cherry-stones, or better from seedlings of the wild cherry For dwarfing, they are worked on the bird cherry or perfumed cherry the latter is preferred in Holland.

Cherry trees are very ornamental in shrubberies and woods, and valuable as encouraging the different species of thrush The gum of cherry trees is eatable, and equal to that of gum arabic, the wood is hard and tough, and used by the turner and cabinet maker

Prunus Pseudo-Cerasus, the Chinese cherry, is of recent introduction, and most valuable on account of its bearing an excellent fruit, and producing it abundantly in a forcing-house

P avium, the gean, *guignc*, Fr, attains a large size, and its timber is of considerable value the black corone cherry is supposed to be an improved variety of it, as are the different geans

P domestica is generally considered the original of the plum tree, *Prune*, Fr, *Pflaumen*, Ger, and *Prugno*, Ital Many, however, conjecture that P insititia, spinosa, and domestica, are the same species There are several sorts of plums found wild in Britain, independently of the sloe, such as the bullace, damson, muscle, and winesour The plum is said to love a lofty exposure, and to be favorable to the growth of grass under it. The bark dyes yellow, the wood is used in turnery, and the dried fruit or prune is formed into electuaries and gentle purgatives Prunes were originally brought from Damascus, whence their name of damask, but are now chiefly imported from France

There are a great many varieties of the plum in France, and in British gardens nearly a hundred sorts By far the best dessert plum is the greengage, *Reine Claude*, Fr, *Regina Claudio*, Ital It is well known throughout Europe, and perfectly distinct from every other variety The damson is the best baking plum, and the winesour the best for sweetmeats Plums are generally grafted or budded on muscle or damson stocks.

Prunus Armeniaca, *Abricot*, Fr, *Abricosenbaum*, Ger., *Albicocco*, Ital, *Albarcoque*, Portug is a fruit tree next in esteem to the peach From its trivial name, it is generally supposed to have originated in Armenia, but Regnier and Sickler assign it a parallel between the Niger and the Atlas, and Pallas states it to be a native of the whole of the Caucasus, the mountains there, to the top, being covered with it, Thunberg describes it as a very large, spreading, branchy tree in Japan Grossier says, that it covers the barren mountains to the west of Pekin, that the Chinese have a great many varieties of the tree double-

History, Use, Propagation, Culture,

blossomed, which they plant on little mounts for ornament, and dwarfs in pots for their apartments. It appears from Turner's Herbal, that the apricot was cultivated here in 1562, and in Hackluyt's Remembrancer, 1582, it is affirmed, that the apricot was procured out of Italy by Wolfe, a French priest, gardener to Henry VIII The fruit seems to have been known in Italy in the time of Dioscorides, under the name of *Præcocia*, probably, as Regner supposes, from the Arabic, *Berkoch*, whence the Tuscan, *Bacoche* or *Albicocco*, and the English *Apricock*, or, as Professor Martyn observes, a tree when first introduced, might have been called a *præcox*, or early fruit, and gardeners, taking the article *a* for the first syllable of the word, might easily have corrupted it to apricocks The orthography seems to have been finally changed to apricot about the end of the last century

There are fifteen or twenty excellent varieties of apricot, besides the peach apricot, a large fruit supposed to be a hybrid between a peach and an apricot The trees are generally budded on plum stocks, and always trained against walls Apricots do not force freely

1130 *Chrysobalanus* From χρυσος, gold, and βαλανος, an acorn, in allusion to the size, color, and form of its fruit C Icaco (the West Indian name) bears flowers and fruit not unlike the plum, which is sold in the markets of the West Indies, and eaten both raw and preserved Both species grow well in a sandy loam Large cuttings root best, taken off at a joint, and planted thinly in a pot of sand, without having their leaves injured, and a hand glass placed over them (*Bot Cult* 39.)

1131. *Mespilus* In Greek μισπιλη, from μισος, half, and πιλος, bullet, the fruit resembling half a bullet or round ball In French it is called *nefle*, from the Celtic *naff*, which also signifies truncate M. Germanica, bears a turbinated berry, which is eaten raw in a state of incipient decay It is little cultivated, but one or two trees are generally introduced in shrubberies or in complete orchards There are one or two varieties besides the wild sort, what is called the Dutch medlar is reckoned the best It is grafted on seedlings of the

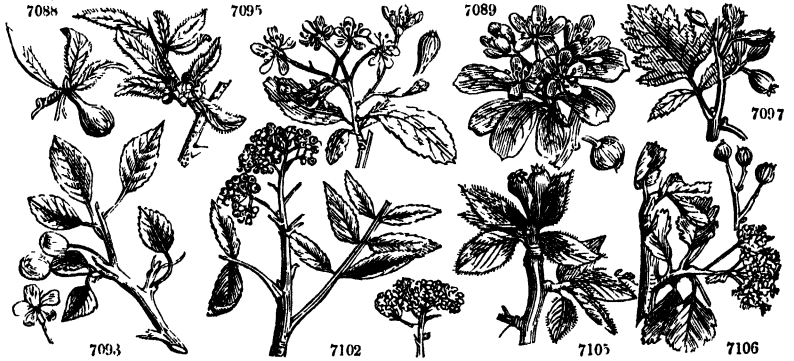
and Miscellaneous Particulars

wild medlar, or on any other species of the same genus often on the common thorn. The other species bears fruit similar to M. germanica, but more dry

1132. *Cratægus* From κρατος, force, on account of the extreme hardness of the wood of the original Cratægus, which appears to be what is now called Pyrus aria, the beam-tree This is a very ornamental genus of small hardy trees, valuable for the neatness of their foliage, the earliness of their flowers in spring, and the rich colors of their berries in autumn

C oxyacantha, οξυς, ακανθα, sharp-spine, is the best hedge plant in Europe, and also furnishes some highly ornamental varieties, especially the double-blossomed and scarlet-blossomed.



The fruit of C odoratissima is very agreeable That of the Azarole (*âl z'arour* Arabic, according to Castel and John de Souza) is much esteemed in the South of Europe In this country it rarely arrives at perfection

1133 *Pyrus* From the Celtic *peren*, the Anglo-Saxons made *pere*, the English, *pear*, the French, *poire*, and the Latins, *pyrus*, or for the fruit, *pyrum* From the Celtic word *aps*, which also signified a fruit resembling an apple, the Greeks obtained απιος, the English, *apple*, the Germans, *apfel*. To this day the French distinguish a tribe of small fruited apples by the name *aps*

P malus, *Pomme*, Fr, *Apfel*, Ger, and *Pomo*, Ital., is the most popular of British fruits None can be brought to so high a degree of perfection with so little trouble, and of no other are there so many excellent varieties in general cultivation, calculated for almost every soil, situation, and climate, which our islands afford Very good apples are grown in the Highlands and Orkneys, and even in the Shetland isles, (*Calcd Hort Mem* vol. ii) as well as in Devonshire and Cornwall, some sorts are ripe in the beginning of July, and others, which ripen later, will keep till June. Unlike other fruits, those which ripen latest are the best

The tree attains a great age, is in general very prolific, and the timber is valuable for the turner, millwright

History, Use, Propagation, Culture,

and cabinet maker The Romans had twenty-two varieties, and there are now several hundreds in Britain and France, and some excellent sorts from America They are usually divided into dessert, baking, and cyder fruits, the first high flavored, the second such as fall or become mellow in baking or boiling, and the third austere, and generally fruits of small size Besides this division, apples are classed as pippins or seedlings, pearmains or somewhat pear-shaped fruits, rennets or queens, specked fruits, calvilles or white-skinned fruits, russets or brown fruits, codlings or falling fruits, and burknots, which grow readily by cuttings Most sorts of apple form ugly trees as standards, but are otherwise very ornamental in shrubberries from their blossoms The crabs, and especially the varieties obtained from the Siberian crab, form much the handsomest heads, and have also more brilliant blossoms The apple may be propagated by layers, and many sorts by cuttings, but the usual mode is by grafting on crab-stocks, and for dwarfing on stocks of the paradise apple

P communis, *Poirier*, Fr, *Birnbaum*, Ger, and *Pero*, Ital, is a fruit-tree next in popularity and value to the apple tree It is a greatly superior dessert fruit, but not so valuable for culinary purposes and the press There are fewer good sorts of pears, in proportion to the number of current varieties, than of apples, but a few, as the Jargonelles, Bergamots, Beurrées, Chaumontelles, &c are most exquisite dessert fruits, and are much easier of digestion than the apple It arrives in greater perfection in France and the north of Italy than in England The Chaumontelles of Guernsey are in high repute, as are the St Germain's and other sorts of Picardy, and the Beurrées of Milan The Romans had thirty-six varieties, and there are many hundreds in the French and British nurseries, most of them good for little Professor Van Mons, of Brussels, and M Duquessie, of Mons, fruited about 8000 seedling pears, from which they obtained nearly 800 sorts worth cultivating (*Neill's Hort Tour*) The varieties are divided into dessert and baking fruits, and also into melting or butter pears, *beurrées*, Fr, breaking pears, *crevers*, Fr, and perry, *poirée*, Fr, fruits The tree is grafted on seedlings of the same species, and for dwarfing and precocity on the quince It is a much handsomer upright growing tree than the apple, more durable, and its wood hard and valuable for the turner and millwright, but its blossoms being white, are less showy than those of the apple

P domestica, and the other species of service are very ornamental trees, their leaves are mostly white

7086 Leaves ovate serrated, Pedunc. corymbose
7087 Leaves serrated downy beneath, Flowers corymbose
7088 Leaves lin lanc hoary white with down beneath, Fl. axillary solitary subsessile
7089 Leaves ovate stalked entire silky beneath, Flowers corymbose
7090 Umbel sessile, Leaves ovate oblong acuminate serrated smooth, Claws shorter than cal Styles smooth

7112 Leaves oblong lanc distantly toothed, Pedicels shorter than calyx
7113 Leaves lanceolate distantly serrated, Panicle hairy

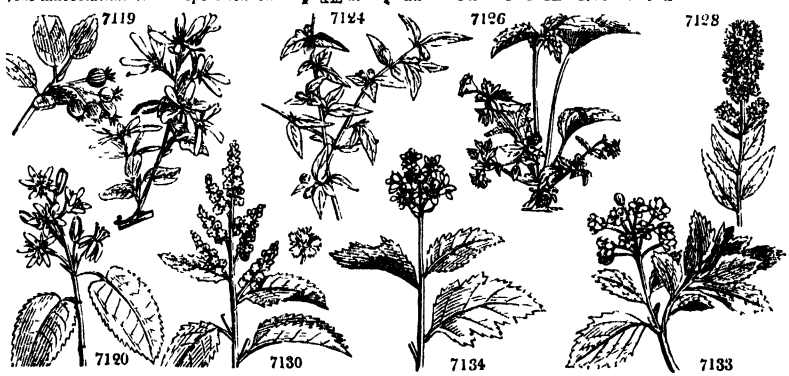
7114 Raceme imbricated with persistent foliaceous bractes, Petals roundish
7115 Leaves ovate lanceolate acuminate at each end, Pet lanc Stamens upright shorter than calyx
7116 Leaves long lanceolate, Stamens spreading longer than the calyx
7117 Leaves linear lanceolate, Sepals subulate much longer than stamens, Panicle contracted

7118 Leaves lanceolate serrated

and Miscellaneous Particulars

underneath, and they are generally profusely covered with blossoms and fruit. Of P domestica there are two varieties, the pear and apple-shaped, cultivated in some parts of France and near Genoa for their fruits Those like the medlar and quince are not eaten till in a state of incipient decay There are but few of the true service in English gardens, but the P hybrida and pinnatifida are common, and their fruit, which resembles that of the mountain ash, is sometimes made use of

P aucuparia and Americana are handsome trees for shrubberies, the former very popular in suburban gardens



1134 *Cydonia* So called from being native of the ancient town Cydon in the Island of Crete; or perhaps it may be a corruption of malus-*cotonea*, by which the Latins designate the fruit. C vulgaris is a deformed low tree, sometimes cultivated for its fruit, which is a pome with a persisting calyx like the medlar It is used as a marmalade for flavoring apple-tarts. It prefers moist loam, and is raised by layers It is most in use, however, as a stock for the pear C japonica is a beautiful low bush, remarkable for the brilliancy of its blossoms, which vary from the richest scarlet to the most delicate blush color It is hardy, and well adapted for single plants, upon grass, or for forming ornamental hedges in flower gardens

1135 *Photinia* So named, we believe, from φως φωτος, light, in allusion to the lucid surface of the leaves of the species P. serrulata and arbutifolia are elegant shrubs, and nearly hardy The latter succeeds perfectly against a south wall

1136 *Raphiolepis.* From ραφις, a needle, and λεπις, a scale, in allusion to the numerous, subulate, persistent bracteæ, which are mixed among the racemes of flowers. Pretty Chinese small shrubs, formerly known under the collective name of Cratægus indica

1137 *Eriobotrya.* From εριον, wool, and βοτρυς, a bunch of grapes, in allusion to the woolliness of its raceme This genus is excellently characterized by the structure of its seed, of which the radicula is retracted within the cotyledons, not exserted as in all the other genera of Pomaceæ E Japonica produces an agreeable fruit about the size of a gooseberry, of a fine yellow color, and, according to Sir Joseph Banks, as good as the mango To ripen it with flavor, it requires the temperature of the stove, and comes into use in March. It may be grafted on any species of the genus, or on the hawthorn

History, Use, Propagation, Culture,

1138 *Amelanchier* According to Clusius, *Amelancier* is the old Savoy name of the plant. It has been adopted by Mr Lindley as the title of a small group of plants nearly related to Pyrus, but curiously distinguished by the 10-cells of the ovary

1139 *Cotoneaster* Named in allusion to the cottony nature of the fruit and young branches of the most common species Small inconspicuous bushes, with solitary pink flowers almost hidden among the leaves

1140 *Waldsteinia* Named by Willdenow, in honor of Franz de Waldstein, a distinguished German botanist. Plants with the aspect of Potentilla or rather Geum

1141. *Spiræa* Σπειρα, signifies a cord *Spireon* is Pliny's name for a plant the blossoms of which are used in garlands. That plant is thought to have been the Viburnum Lantana. This genus affords some orna-

7119 Leaves roundish elliptical acute pubescent beneath, Sepals smooth, Germen villous
7120 Leaves oblong elliptical cuspidate smooth, Sepals smooth, Germen pubescent
7121 Leaves roundish elliptical acute smooth, Petals obovate, Sepals and germen pubescent

7122 Leaves ovate rounded at base, Cal. and pedunc. naked
7123 Leaves elliptical obtuse at each end, Cal. and pedunc. woolly
7124 Leaves ovate acuminate a little hairy on each side, Cal and pedunc naked
7125 Leaves ovate attenuate at base, Cal and pedunc woolly

7126 Leaves radical stalked 5-lobed

7127 Leaves lanceolate entire sessile, Racemes compound

7128 Leaves oblong serrated smooth, Racemes decompound

7129 Leaves ovate elliptical acute at each end smooth coarsely serrated, Racemes spreading panicled
7130 Leaves lanceolate unequally serrate downy beneath, Flowers doubly racemose
7131 Leaves linear-lanceolate toothletted smooth, Corymbs lateral
7132 Leaves obovate entire, Umbels sessile
7133 Leaves obovate cut-toothed at end, Corymbs stalked
7134 Leaves ovate lanceolate doubly toothed, Corymbs stalked
7135 Leaves broad ovate cut-serrate smooth, Corymbs terminal compound leafy
7136 Leaves obovate acute toothed at end 3-nerved, Corymbs close stalked
7137 Leaves oblong lanceolate serrated at end and entire, Corymbs stalked
7138 Leaves roundish bluntly lobed toothed, Umbels stalked
7139 Leaves obovate obtuse 3-lobed, Umbels lateral sessile
7140 Leaves obovate obtuse at the end bluntly and unequally 3-nerved, Corymbs axillary sessile
7141 Leaves ovate 3-lobed serrated, Corymbs stalked
7142 Leaves pinnated, Leaflets even serrated, Flowers panicled

7143 Leaves ovate acute smooth serrated stalked glaucous beneath, Cymes pubescent
7144 Leaves oblong bluntly and irregularly serrated, Flowers in dense corymbs
7145 Leaves obovate obtuse forwards doubly serrated smooth, Corymbs terminal compound, Flowers capitate
7146 Leaves supra-decompound, Spikes panicled, Flowers dioecious
7147 Leaves pinnated, Leaflets even serrated, Flowers corymbose

7148 Leaves pinnated downy beneath, The end lobe larger and 3-lobed, the side ones undivided

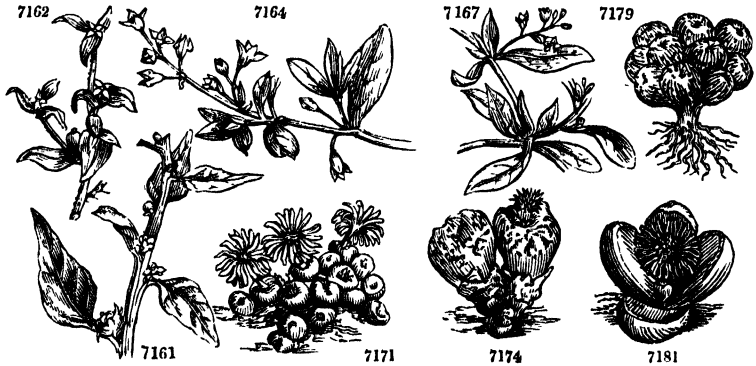
7149 Leaves pinnated smooth, The end lobe 7-lobed, the lateral 3-lobed, Corymbs proliferous

7150 Stipules linear entire, Calyx tubular campanulate
7151 Stipules leafy ovate cut-toothed, Calyx campanulate

7152 Leaves spatulate oblong, Joints of stem tumid, Fl stalked
7153 Flowers sessile, Leaves linear oblong flat
7154 Leaves linear lanc revolute at edge, Fl terminal sessile
7155 Leaves lin spatulate, Joints of stem equal, Fl stalked
7156 Leaves lanc spatulate, Joints of stem creeping filiform, Fl. stalked

7157 Leaves cuneiform ovate, Flowers sessile
7158 Leaves roundish cuneiform pilose, Fl sessile, Cal hairy
7159 Leaves lanceolate, Flowers sessile apetalous
7160 Leaves lanceolate, Flowers panicled

and Miscellaneous Particulars



mental shrubs, free flowerers, and of easy culture, as S. salicifolia, hypericifolia, tomentosa, &c. The herbaceous species, especially filipendula, ulmaria, and aruncus, are also very ornamental

1142. *Gillenia* A genus well divided by Monch from Spiræa, from which it differs in so many respects as to make it astonishing that the species should ever have been referred to that genus, even by the most unreasonable advocate of the exploded doctrines of synthetical botany. Pretty North American plants with lobed discolored leaves, and white flowers

1143 *Sesuvium* Meaning of the name unknown Inelegant plants with the habit of purslane.

1144 *Aizoon* From αει, always, and ζαω, alive, always alive, or evergreen A name given by the Greeks to the Sempervivum. This is an uninteresting genus, only known among the curious.

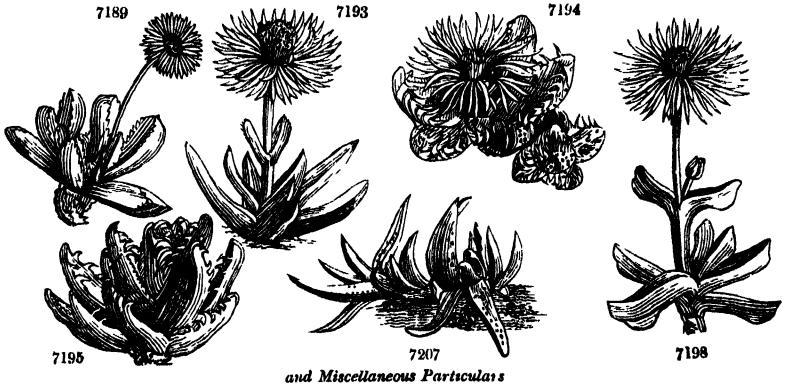
History, Use, Propagation, Culture,

1145 *Tetragonia* From τετρας, quaternary, and γωνια, an angle, in allusion to the four angles of the bony pericarpium The species are succulent trailers of no beauty, but possibly all fit to be used, like Chenopodium, as a spinage T expansa has been so used by Captain Cook when visiting New Zealand, and lately introduced for the same purpose in British gardens, as a summer spinage, it is as valuable as the orache, or perhaps more so. Every gardener knows the plague that attends the frequent sowing of common spinage through the warm season of the year, without that trouble it is impossible to have it good, and with the utmost care it cannot always be obtained exactly as it ought to be, (particularly when the weather is hot and dry,) from the rapidity with which the young plants run to seed. The New Zealand spinage, if watered, grows freely, and produces leaves of the greatest succulency in the hottest weather Anderson, one of its earliest cultivators, had only nine plants, from which, he says. "I have been enabled to send in a gathering for the kitchen every other day since the middle of June, so that I consider a bed with about twenty plants quite sufficient to give a daily supply, if required, for a large table."



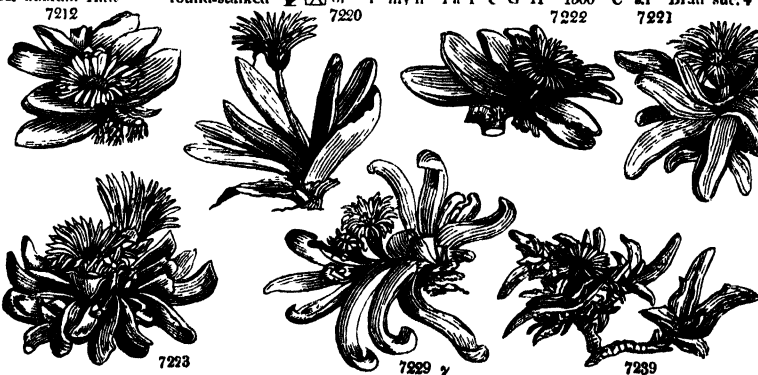
7161 Herbaceous, Leaves ovate rhomboid, Fruit with 4 horns
7162 Frosted, Leaves ovate sessile, Fruit not horned
7163 Shrubby, Leaves linear, Fruit winged
7164 Shrubby frosted, Leaves obovate, Fruit winged
7165 Procumbent, Leaves sessile lanceolate decumbent, Wings of fruit 8 alternately smaller
7166 Smooth herbaceous erect, Lower leaves ovate upper lanceolate smooth, Fl. racemose
7167 Smooth herbaceous, Leaves ovate stalked, Fruit winged
7168 Herbaceous, Leaves rhomboid ovate, Fruit ubinate
7169 Leaves alternate linear revolute at edge with a dorsal line above
7170 Leaves alternate frosted obovate with winged decumbent stalks

§ 1 *Stem none or very short, Root perennial, Leaves large.*

7171 Whitish polished unarmed, Flower with a long tube
7172 Smooth rather glaucous with branched confluent spots, Ovary exserted
7173 Smooth green with great confluent branched spots, Ovary included
7174 Glaucous, Spots branched confluent, Ovary included
7175 Green, Spots confluent wart-like, Ovary included
7176 Pyriform glaucous retuse at end, Spots generally distinct green and obsolete
7177 Very depressed and rather glaucous, Spots nearly distinct, Ovary exserted
7178 Somewhat hoary and pubescent much depressed
7179 Nearly globose pale green berry-shaped with little dark scarcely confluent spots
7180 Glaucous smooth, Ends of the leaves unequally distinct flat above
7181 Leaves about 4 broadly ovate or parabolical half rounded expanded
7182 Leaves 6-8 oblong-ovate half round erect
7183 Green, Leaves unequally half rounded acinaciform obtuse
7184 Whitish, Leaves equally half rounded very blunt
7185 Stemless, Leaves rounded very smooth
7186 Leaves perfect about 4 clavate 3-cornered very thick glaucous with many large dots

7187 Leaves hoary at the base half rounded and thin upwards gibbous and keeled
7188 Stemless, Leaves entire half round green marbled at the end keeled 3-cornered
7189 Stemless, Lvs glaucous towards the end and the bractes incurved and toothed, Pedunc length of leaves
7190 Leaves glaucous, Marginal fringes numerous very deep
7191 Nearly stemless Lvs glauc towards end entire or with large teeth, Bractes entire, Pedun longer than leaves
7192 Stemless smooth whitish, Lvs half round entire at end keeled 3-cornered little thickened with a recurved
7193 Stemless very smooth white, Leaves thick subulate 3-cornered obtuse with a point [point
7194 Green stemless, Leaves cordate ovate expanded marbled with white and with a deep fringe
7195 Stemless glaucous, Leaves deeply tooth-fringed obsoletely dotted with a cartilaginous keel at end
7196 Stemless green with clear spots, Leaves 3-cornered towards the end with a shortly toothed fringe
7197 Nearly stemless glaucous, Leaves with 3 rows of toothed fringe and small dots
7198 Leaves exactly hatchet-shaped, The old stem nearly six inches high and erect
7199 Leaves keeled 3-cornered green, Scape strong paniculed 2-edged
7200 Leaves erect incurved keeled upwards long glaucous rugose with large dots
7201 Leaves very glaucous triquetrous compressed at the end with a dilated keel which is often toothletted

7202 Leaves obt dotted with gibbous pustules at the base in the inside, Stem strong short decumbent branch
7203 Stemless, Leaves connate dotted half round at the end triquet reflexed acute, Fl sessile, Cal. cylin 6-fid
7204 Nearly stemless, Leaves hoary glaucous obtuse towards the end with a few spots, Cal 4-fid
7205 Nearly stemless, Leaves glaucous very blunt with many dots, Cal 2-4-fid
7206 Nearly stemless branched, Leaves subul elong dott very glauc Bractes 4 crossing shorter than scape
7207 Stemless, Leaves subulate elongated acute glauc much dott Bractes 2 longer than scape
7208 Like the last, but leaves half cylindr connate warted outside
7209 Leaves obl at the base inside with elevated pustules, Old stem three inches long decumbent
7210 Leaves papulose iced, the first psiform, the next half round, Stem much branched corky



and Miscellaneous Particulars

The seed should be sown in the latter end of March in a pot, which must be placed in a melon-frame; the seedling plants, while small, should be set out singly in small pots, and kept under the shelter of a cold frame, until about the twentieth of May, when the mildness of the season will probably allow of their being planted out, without risk of being killed by frost. The plants must be put out three feet apart in very rich soil. In five or six weeks from the planting, their branches will have grown sufficiently to allow the gathering of the leaves for use. In dry seasons, the plants will probably require a good supply of water They put forth their branches vigorously as soon as they have taken to the ground, and extend before the end of the season three feet on each side.

1146. *Mesembryanthemum.* From μεσημβρια, the mid-day, on account of the flowers usually expanding at that time the termination *anthemum*, which signifies flowering, is, to say the least of it, superfluous. The species of this extensive genus are singular, yet beautiful, and some even splendid plants. Their leaves are of odd shapes, and the habits of most of the sorts slovenly and insignificant, though some are grotesque, but the

History, Use, Propagation, Culture,

flowers make ample amends by their profusion, the brilliancy of their colors, and the length of time the species continue in flower. Few are annual, fewer biennial, many are perennial, but most are shrubby,

7211 First leaves connate spheroidal, next half round subulate very long recurved green
7212 Leaves sloping graver-shaped very broad thickest on one edge at the base inside pimpled, Fl sessile
7213 Nearly stemless Lvs. tongue-shaped thick, one convex blunt at end, the other with a long keel, Fl stlkd frag.
7214 Leaves obliquely tongue-shaped pale green very soft, the younger ciliated pubesc hooked inwards at end
7215 Nearly stemless, Lvs tongue-shaped sloping 4-inches long, 1-broad cultrate, Peduncle an inch long
7216 Nearly stemless, Lvs distichous tongue-shaped at the edge and end cultrate. Fl stalked
7217 Leaves long very green and polished, Peduncle longer than calyx, Caps small depressed
7218 Leaves broad tongue-shaped ascending obtuse green longer than peduncles
7219 Leaves tongue-shaped ascending 5-6-in long, 3-11-lines broad, with large pimples at the base inside
7220 Leaves long tongue-shaped shining thinner, Flowers subsessile, Caps large depressed

722 Leaves unequally tongue-shaped thick green partially keeled, Caps little elevated subsessile

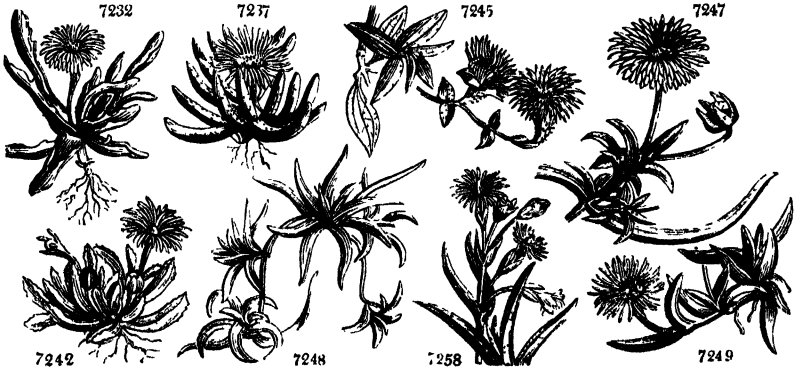
7222 Leaves tongue-shaped obtuse thick often sloping and a little hollowed, Caps large conical subsessile

7223 Prostrate, Lvs narr. tongue-shaped obt. recurved depressed variously bent inwards at end, Caps depressed

7224 Leaves lin tongue-shaped half cylindr very soft cruciate, Old stem three inches long
7225 Leaves bifarious obliquely crossed half round obt very thick yellowish green incurv Old stem 6 in high
7226 Stemless, Lvs ½ cylin subul variously obliquely hooked blunt with broad smooth spots at base, Caps flat [half included

7227 Lvs. crossing suberect or spreading half round subulate acute soft often pustulate at base, Ovary exserted [stalked

7228 Stemless, Leaves green deformed the upper longest
7229 Leaves linear linguiform half cylindrical very long



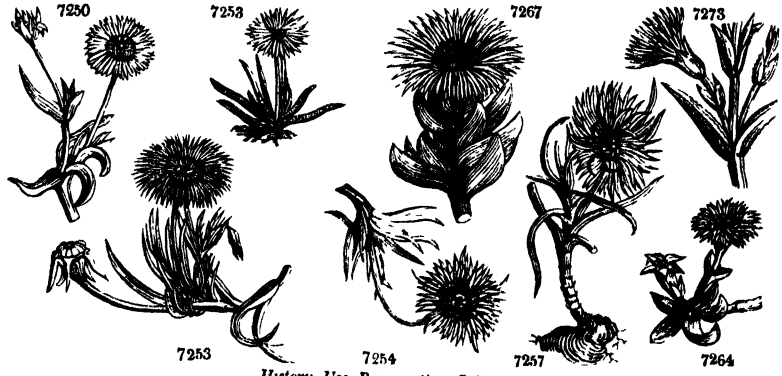
7230 Lvs. obliquely cruciate long variously obliquely deformed with one or more obscure teeth, Old stem 3-6-in
7231 Lvs. ½ cylin thick soft with two large opp fleshy teeth beyond the midd at the end variously and obliquely [deformed
7232 Lvs very narr tongue-shap ½ round towards end oblique with 1 or 2 obsolete teeth, Old stem branch 6 in.
7233 Nearly stemless, Leaves yellowish green spreading ovate half cylindrical rarely keeled at end
7234 Stem weak two or three inches long, Lvs obl ½-cylindr upwards 3-cornered yellowish green
7235 Stem weak two or three inches long, Leaves half-cylindr. 3-cornered or subovate very green
7236 Leaves downy hoary or silky smooth
7237 Leaves subulate glaucous at the base above flat, Styles 8
7238 Leaves obsubulate thick obtuse green
7239 Leaves 3-cornered cylindr subglaucous dotted 3 inches long, The old stem 3 inches closely branched
7240 Lvs 4 in long green roundish or cylindr the younger polished ½ round very green the old stems 6 in.
7241 Leaves 3-cornered rounded very thick green dotted two inches long [polished
7242 Leaves 3-cornered blunt with three rows of teeth at end, The old stem branched half shrubby

7242 Leaves half round subulate incurved with clear spots, Spots obsolete not wrinkled
7244 Leaves half round subulate incurved with clear spots, Spots large numerous with a white head
7245 Leaves half round subulate incurved with clear spots, Spots nearly middle sized with a little white point

§ 2. *Cluster-leaved Stem about a foot high decumbent perennial, Leaves in capitate clusters, Flowers polygamous, Calyx 5-leaved*

7246 Lvs capit. closely clustered ½ cylindr 3-cornered elong recurv somewhat glaucous, Stems roundish white
7247 Lvs capitate closely clustered long 3-cornered half cylindr glaucous or green, Stems angular red

7248 Lvs somewhat clustered long ½-cylindr 3-cornered minutely wrinkled, Stems prostrate with distant joints
7249 Leaves clust longish broad erect half cylindr 3-cornered shining, Joints close, Styles 12



and Miscellaneous Particulars

especially towards the base Leaves mostly opposite, seldom alternate, thick, or succulent, of various forms Flowers solitary, axillary, or extra-axillary, but more frequently terminating The fruit is some-

History, Use, Propagation, Culture,

times shaped like a fig. Linnæus arranged the species from the color of the flower; Haworth chiefly from the leaves.

7250 Leaves clust 3-cornered ½ cylindr very long glaucous incurved, Stems scarcely angular, Joints distant

7251 Leaves in pairs corniculate incurved ½ cylindr 3-cornered glaucous, Stems flexuose procumbent
7252 Leaves exactly cylindr. three inches long acute green, Styles 20
7253 Leaves glaucous about a foot long 3-cornered, Angles dilated with a broad furrow, Stem simple

7254 Leaves somewhat glaucous 6-7 inches long 3-cornered, Old stem simple
7255 Leaves green 3-4 inches long 3-cornered, Old stem two inches high simple erect
7256 Leaves dagger-shaped long glittering, Stem shrubby perennial
7257 Leaves glauc about a span long bluntly 3-cornered channelled or half round, Root large tuberous fleshy

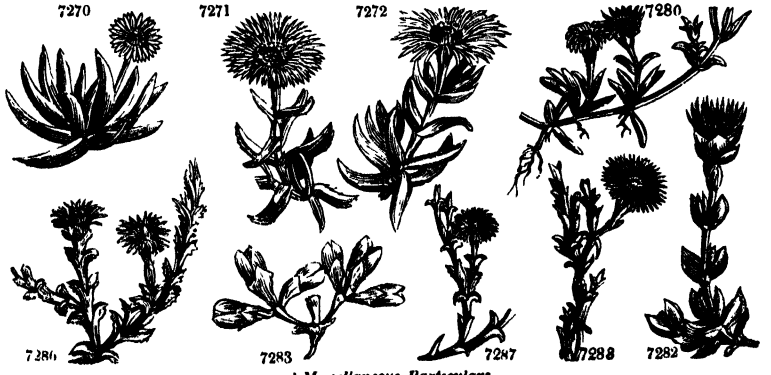
§ 3 *Trailers Stems prostrate or creeping, angular, Calyx 5-leaved, Flowers polygynous, Leaves connate at base acutely 3-cornered*

7258 Branches long slender spreading, Lvs equilateral 3-corn green hooked a little outwards at end, Fl 3 or 2
7259 Lvs equilateral 3-corn glauc much dotted straight at end lon than joints, Edges not serr Stems firm proc
7260 Lvs conn comp 3-corn very green warted often short than joints, Edges finely tooth Branches very slen.
7261 Runners 1½ foot long slender rooting, Lvs clustered compressed 3-corn bright green not rough at edge
7262 Leaves long equilateral 3-cornered straight roughish at edge, Stem firm procumbent
7263 Leaves compressed 3-cornered large recurved serrulate very rough, Old stems firm decumbent [decum
7264 Lvs bright green clust thick comp 3-corn acinacif dott lon than joints with rough edges, Stems short
7265 Lvs. comp 3-corn acinacif glauc not serrated and scarcely cartilaginous at edge generally lon than joints

7266 Lvs comp. 3-corn greenish rugose the edges with cartilaginous serratures generally shorter than joints

7267 Leaves acinaciform, Edges curled wavy rough

7268 Leaves acinaciform polished glaucous with entire cartilaginous edges
7269 Leaves acinaciform with the edges and keel rough and red



7270 Leaves compressed 3-cornered acinaciform and equilateral, Every edge roughish
7271 Old leaves equilateral 3-cornered green incurved three inches long blistered inside at base, Keel serrulate
7272 Leaves about two inches sharply 3-cornered, the old ones comp with their keel upwards serrulate burnt
7273 Young lvs incurved equilateral 3-cornered soft glauc with a cartilaginous smoothish white edge, Styles 7
7274 Leaves acinaciform or compressed 3-cornered glauc with a pink smooth cartilag edge, Stems prostrate
7275 Leaves not equilateral 3-cornered greenish, Stems prostrate, Pedunc terminal solitary winged, Styles 8
7276 Leaves equilateral 3-cornered greenish, Edges smooth cartilaginous, Stems weak prostrate
7277 Lvs comp 3-corn acinacif smooth dotted green, in the inside at the base blistered, Keel roughish at edge
7278 Leaves clustered 3-cornered acute glaucous with large rough pellucid dots, Stems filiform very weak
7279 Leaves glaucous dotted 3-cornered incurved smooth
7280 Leaves 3-cornered not dotted smooth very green half cylindrical at base
7281 Leaves clustered expanded obsoletely 3-cornered clavate obtuse green with a little point

§ 4 *Perfoliate Leaves connate sheathing generally three-cornered upwards, usually hooked at end, Calyx 5-leaved*

7282 Leaves 3-cornered compressed green prickly at end, Stem 2-edged decumbent
7283 Leaves erect white smooth 3-cornered thick sheathing beyond their middle with a cartilaginous edge
7284 Leaves 3-cornered subacinaciform white at edge, Keel dilated
7285 Leaves beaked connate half round subulate recurved dotted green, Stems prostrate branched knotty
7286 Leaves white thick hard dotted usually with about three spines beneath, Branches few

7287 Leaves whitish thick dotted recurved at end usually with one spine beneath, Branches many
7288 Leaves greenish with two spines beneath at the end
7289 Branches simple slender upright hard, Lvs 3-cornered dotted white with 1-4 teeth at the back upwards
7290 Leaves quite entire very green smooth thick hooked backwards at the end
7291 Leaves acute-angled 3-cornered acum incurved recurved green rough at edge
7292 Erect, Lvs usually close recurved smooth green with the angles roughish above, Sheath often sharp

[rough upwards
7293 Erect roughish, Lvs about an inch long spreading straight recurv at end, Sheaths green smooth, Angles

and Miscellaneous Particulars.

Most of the species are so hardy, that on dry rock-work, in a sheltered part of the garden, they will endure ordinary winters. Every thing, however, depends on keeping them dry Among the hardy sorts may be reckoned

History, Use, Propagation, Culture,

M. hispidum, striatum, barbatum, crassifolium, glaucum, uncinatum, corniculatum, &c Hardy, and vet shewy sorts, are M. inclaudens, aurantium, perfoliatum, deltoides, barbatum, &c. These will grow and

7294 Leaves half an inch long smooth suberect, Keel not serrulate, Stem three feet high and branches erect
7295 Lvs about three lines long horiz and sheaths smooth, Keel rough at end, Branches very stiff and spread.
7296 Lvs 3 lines long and more spreading thin and sheaths rough at edge, Branches filiform decumbent
7297 Lvs somewhat compressed 3-cornered glauc. about one inch long, Branches many erect, Cal. turbinate

7298 Leaves somewhat compressed 3-cornered glaucous and the branchlets spreading

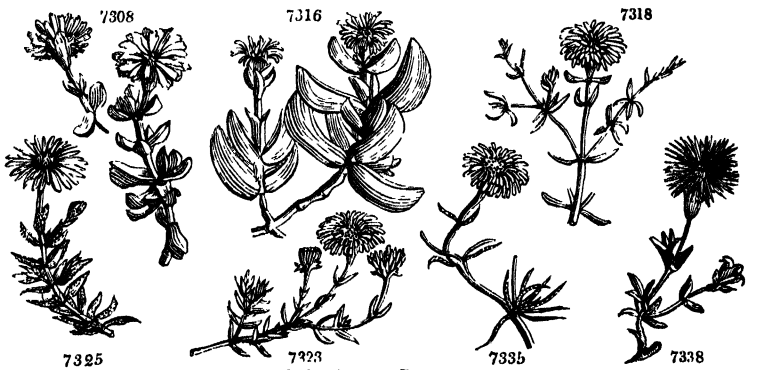
7299 Leaves distant roundish somewhat glaucous roughish with dots, Sheaths tumid at end

7300 Leaves remote greenish smooth about an inch and half long recurved at end, Sheaths tumid at end

7301 Leaves somewhat glaucous smooth clustered obtuse an inch long with a recurved point
7302 Leaves connate incurve-recurved blunt, Keel roughish at end with a sheathing line at base

§ 5 *Delta-leaved Leaves more or less deltoid or hatchet formed Flowers pink*

7303 Leaves subulate 3-cornered dotted with the keel serrated backward
7304 Leaves glaucous compressed 3-cornered gladiate, Keel cartilaginous torn, Petals much longer than calyx
7305 Lvs clust not dotted glauc shortly falcate gladiate, Angles cartilag Petals much shorter than calyx
7306 Lvs clust compressed 3-cornered shortly acinaciform glauc entire dotted with a cartilaginous edge



7307 Leaves distinct clust. equilaterally 3-corn shortly acinaciform green dotted with a cartilaginous edge
7308 Lvs subdelt smooth very green with a gibb entire keel, Pet not closing the inner imbricate very short
7309 Leaves clustered glaucous long 3-cornered deltoid, The sides not toothed, Keel entire
7310 Leaves clust very glauc 3-corn deltoid toothed in three rows, Keel of the bractes and sepals entire
7311 Leaves clust deltoid with the bractes and sepals 3-cornered glaucous toothletted in three rows

7312 Leaves 3-corn acuminate awned green blistered inside at the base, Branches much clustered
7313 Leaves obl ovate acute glaucous 3-corn with a little white point at end
7314 Leaves connate at base oblong ovate half round not pointed, the winter leaves joined almost to the end
7315 Leaves acute equilaterally 3-corn cymbiform grey obsoletely dotted with a downy fringe and recurv point

§ 6 *Triquetrous Leaves more or less 3-cornered distinct Cal 5-leaved Styles 5*

7316 Leaves large clustered much compressed 3-corn incurved very glaucous, Stem woody erect bushy
7317 Leaves small much clust somewhat connate compressed 3-corn closely incurved, Branches clustered
7318 Leaves minute distinctly compressed 3-cornered falcate, Branches numerous filiform
7319 Leaves much compressed 3-corn very glauc attenuate at each end incurved, Branches much clustered
7320 Leaves compressed 3-corn very glaucous attenuate at each end acinaciform, Stem erect

7321 Leaves 3-corn clust robust incurved very glaucous, Stem erect much branched
7322 Leaves much clustered thick acinaciform falcate with large spots glaucous
7323 Lvs bluntly 3-corn comp glauc incurv atten at each end, Pedunc and branches erect filiform comp
7324 Lvs clustered falcate inflexed from 3-cornered half round compressed subglaucous smooth
7325 Leaves subtriquetrous green shining warted very rough, Sepals ovate acuminate, Petals crenate at end
7326 Leaves subtriquetrous glaucescent warted very rough, Sepals ovate-acuminate, Petals two toothed at end
7327 Leaves subtriquetrous very glaucous rough, Sepals and petals distant reflexed, Stamens clust Bark white
7328 Erect woody, Leaves lin obsoletely 3-corn smoothish glauc. white imbricated at the ends of old branches
7329 Leaves subtriquetrous glauc roughish attenuated downwards, Stems clust deflexed, Pet very numerous
7330 Leaves subtriquetrous glauc. attenuated upwards smooth, Keel roughish, Branches distant filiform
7331 Leaves small glauc 3-corn rough, Branches bushy clust The young bark brown, Flowers panicled
7332 Leaves small often longer than the joints but inwards by pairs glauc 3-corn obtuse smooth
7333 Leaves much clust strong incurved-recurved clavate compressed dotted glaucous, Branches bushy
7334 Leaves compressed bluntly 3-corn roughish with dots glaucous, Sepals like spines spreading
7335 Leaves subglaucous subtriquetrous rough, Calyxes spiny, Petals deeply emarginate
7336 Leaves distinct remote subrecurved triquetrous much comp dotted glauc. Keel gibbous above middle
7337 Leaves distinct distant triquetrous compressed acute subglaucous dotted, Branches twiggy
7338 Leaves green, Bractes 4 broadly ovate keeled embracing the calyx, Pet. white at base, Branches fuscous
7339 Branches decumbent 2-edged brown, Leaves acinaciform 3-corn with sides membranous downwards, Dots large pellucid elevated

and Miscellaneous Particulars.

flower vigorously if planted in a bed in the open air and protected during winter, or if planted in a common pit, and matted over during frost

History, Use, Propagation, Culture,

M nodiflorum grows wild in Italy and Egypt, and in the latter country is burnt for potash, which it produces in excellent quality.

7340 Leaves glauc. slender roughish, Bractes ovate acute almost surrounding the calyx, Branches very slender [straight

7341 Leaves glaucous, Bractes broad ovate, Branchlets clustered, Stem hoary
7342 Leaves glauc equilateral 3-corn very rough, Bractes ovate acute embracing the peduncles upwards
7343 Leaves 6-12 lines long half erect glauc with little pellucid rough dots
7344 Leaves compressed 3-corn. longish bluish-green with rough pellucid dots, Keel usually onetoothed

7345 Low, Leaves green sparkling in the sun and branches very dense, Flower-stems decumbent
7346 Lowish, Lvs glauc. 3-corner and branches very close, Fl.-stems ascending or erect, Styles obovate twice
7347 Leaves green sparkling in the sun and branches close, Flower-stems erect [as short as stamens
7348 Lvs. close compressed 3-cornered very green, Ped longer than bract, Flowers spreading flat in the sun
7349 Leaves compressed 3-cornered glaucous, Branches stout, Pedunc. clavate, Corolla incurved
7350 Leaves cylindrical 3-cornered, Petals orange, Styles dark purple
7351 Leaves cymbiform pale-green with large dots, Branches few 2-edged hoary
7352 Lvs very glauc 3-corn compressed, Sepals obl. ovate, Pet deep orange imbricated, Styles purple outside
7353 Lvs acutely 3-corn much compressed glauc roughish, Sepals ovate cordate, Pet sulphur, Styles yellow
7354 Leaves 3-cornered obtuse expanded glaucous with large spots, Stem much branched woody stiff erect
7355 Leaves 3-cornered spreading cymbiform glaucous, Stems branched, Branches filiform nearly erect close
7356 Lvs distinct 3-corn ovate granular 3 lines long, Flowers yellow opening in the evening, Stems expanded
7357 Leaves spreading turgid 3-cornered hoary bluntly dotted at edge, Branches clustered 2-edged decumbent

§ 7. *Slender, Leaves distinct, dotted, rounded, without warts, Flowers opening in the morning, red, orange, or yellow*

7358 Lvs rounded 3-corn somewhat compressed obt glauc Pedunc smooth at base, Sepals obt. nearly equal
7359 Leaves 3-cornered acute green, Pedunc and cal unequal rough, Petals yellow inside

7360 Leaves about 3-cornered very green, Pedunc in fruit clavate, Sepals very unequal, Branches loose
7361 Leaves half round subcompressed subulate green smooth longer than joints, Stems erect or procumbent

7362 Lvs 3-corn compressed glauc rough, Sepals unequal, Petals changing from yellow to pink, Stems effuse
7363 Branches and lvs cylindrical subul spuniform erect recurved at end, Pedunc and keels of bractes rough

7364 Lvs distant expanded at base incurv half round subul Branch firm suberect roughish angul compressed
7365 Lvs 3-cornered subulate incurved below hooked at end, Branches filiform compressed wavy decumbent
7366 Leaves clustered half cylindrical acuminate much recurved at end, Branches erect very close
7367 Tufted, Leaves clustered half cylindrical acuminate with filiform very weak creeping stems
7368 Leaves rounded 3-cornered dotted distinct, Spines branched
7369 Leaves long rounded 3-cornered subulate incurved glaucous edged at base
7370 Leaves rounded incurved smooth thickest in middle glaucous, Stem straight branched
7371 Flowers terminal 3, Two sepals deeply divided
7372 Leaves subulate rounded 3-cornered acute somewhat incurved very glaucous, Bark chestnut-colored
7373 Leaves clustered cylindrical obtuse arcuate glaucous smooth
7374 Leaves connate at base very close and glaucous 3-cornered cylindrical soapy, Flowers afternoon

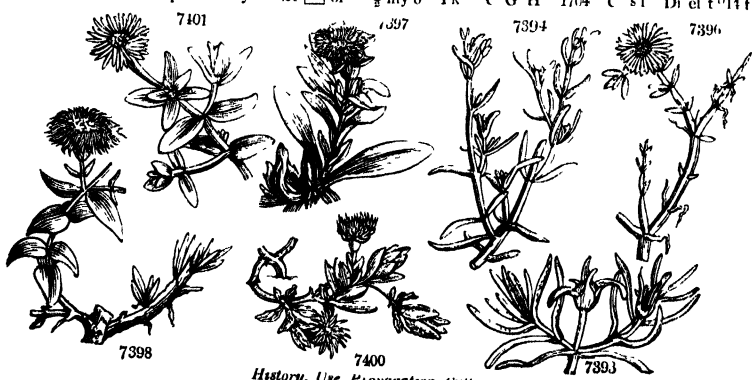
7375 Leaves clustered 3-cornered half cylindrical mealy obtuse shorter than joint soapy, Sepals very unequal

§ 8 *Warted, Leaves and branches almost always more or less warted, Root biennial or annual*

7376 Leaves large ovate acute wavy frosted with three nerves beneath, Root biennial
7377 Leaves large altern ovate much wavy, as are the stems and cal, bespangled with ice drops, Root annual
7378 Leaves oblong pinnatifid pimpled, Petals minute yellow
7379 Leaves flat spatulate and stems pimpled, Branches divaricating, Fl sessile

7380 Leaves amplexicaul spatulate keeled, Pimples conical rough, Petals very minute
7381 Leaves opp and altern ovate spatulate wavy pimpled, Branches and calyxes angular, Fl afternoon
7382 Leaves altern lanceolate bluntish pimpled, Calyxes stalked crystalline

7383 Leaves stalked cordate ovate, Stems procumbent spreading, Cal 4-cleft 2-horned
7384 Leaves broad lanceolate flattish smooth ciliated distinct, Stem peduncle and ovaries hairy



7385 Leaves opp lanc acute subciliate, Pedunc solitary subterminal very long hairy, Sepals lanceolate
7386 Lvs lin.-lanc ciliated, Stems branched effuse, Pedunc bractes and cal shorter than flower woolly villous
7387 Leaves lin.-lanc scarcely spatulate and calyx ciliated, Sepals linear thick or turgid, Pedunc scabrous
7388 Leaves spatulate flat smooth, Pedunc very long, Cal flat at base angular
7389 Leaves opp spatulate blunt rough, Pimples oblong, Sepals oblong blunt contracted in middle

and Miscellaneous Particulars.

M crystallinum is a popular hothouse annual, which does well in the open air in the summer season.
M. umbellatum forms one of the handsomest shrubs of the genus, standing without support with a stout

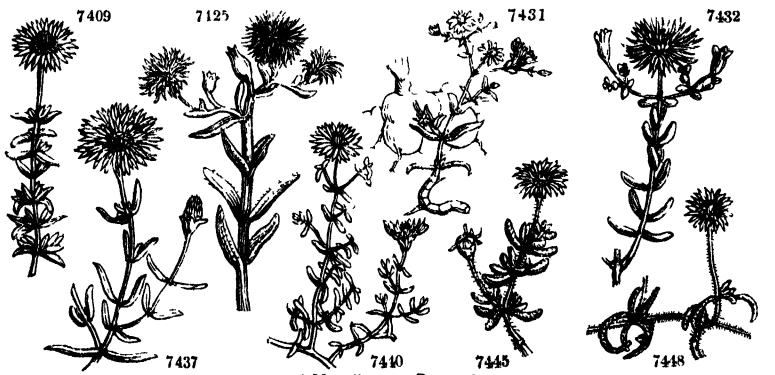
History, Use, Propagation, Culture,

stem, two or three feet high, with terminating white flowers, which open, when the sun shines, from seven or eight in the morning to two or three in the afternoon, and smell like those of the hawthorn The fruit of M. edule is eaten by the Hottentots and Dutch inhabitants of the Cape, and is called Hottentots' figs.

7390 Leaves linear inflexed channelled blunt rough, Pedunc and calyx jewelled with crystals

7391 Leaves pubescent connate not dotted, Stem hairy [of leaves
7392 Leaves filiform half round distinct, Pimples ovate, Fl. lateral sessile the terminal surrounded by a pair
7393 Leaves amplexicaul distinct linear flat above pimpled longer than joints, Fl stalked
7394 Leaves alternate roundish obtuse ciliated at base
7395 Leaves opp connate half round, Stipules membranous reflexed torn fringe-like
7396 Leaves half round papulose distinct, Fl sessile axill Cal 4-cleft
7397 Leaves alternate lanceolate flat not dotted, Stems lax simple, Cal 5-cornered
7398 Leaves flattish lanceolate not dotted spreading distinct opp and altern remote
7399 Leaves lanc acuminate keeled fleshy bluntly 3-cornered channelled, Pedunc very thick
7400 Leaves flattish oblong ovate papulose clustered connate, Cal 3-leaved 2-horned
7401 Leaves amplexicaul glaucous distinct obl lanc inflexed concave, Sepals ovate obl longer than cor
7402 Leaves lorate long channelled inflexed blunt very glaucous convex beneath, Sepals obtuse as long as cor
7403 Lvs lorate obl blunt glauc livid channelled dotted papulose keeled, Stems branched rounded decumbent
7404 Leaves lorate acuminate green smooth, Stem very short and thick
7405 Leaves lanc elliptical crystalline when dead having only the nerves remaining, Stems procumbent



7406 Leaves connate ovate papulose, Branches erect clustered
7407 Leaves lanc lin somewhat channelled convex beneath, Fl solitary termin d [acute
7408 Lvs clustered papulose erect somewhat imbricate subul half round, Fl ternate cymose, Sepals digitiform
7409 Leaves half round not dotted recurved distinct close, Cal terminal finger-shaped
7410 Lvs close flexuose recurved very green half round, Sepals finger-shaped, Stems flexuose shining slender
7411 Leaves acuminate green, Sepals 2 much elongated
7412 Leaves close linear subulate half round pale green deeply channelled, Sepals acute
7413 Leaves close flexuose reflex subulate half round glaucous, Sepals equal 5 membranes on each side

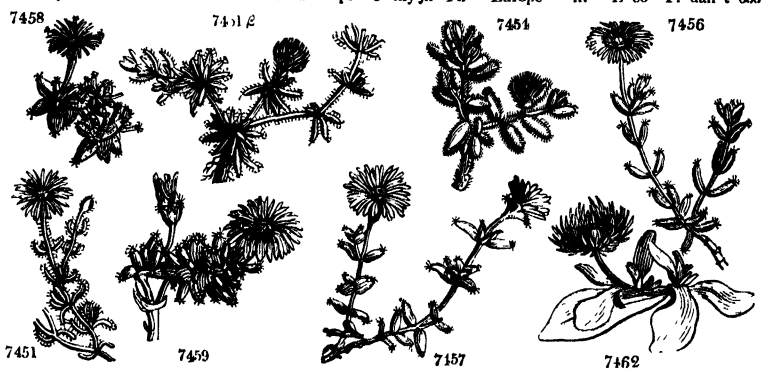
7414 Leaves distinct roundish pimpled, Stem erect, Branchlets 1-flowered
7415 Leaves opposite amplexicaul distichous oblong-lanceolate acute bluntly keeled, Pimples minute
7416 Leaves lanc linear keeled not dotted distinct, Flowers stalked, Two sepals very long

7417 Lvs subulate half round acute remote, Fl term dichotomous, Sepals very unequal, Branches sometimes
7418 Branches round granular closely dotted [rush-formed
7419 Leaves very slender 1-sided effuse, Leaves erect linear very fine
7420 Branches procumbent knotted at the base, Spines of the leaves very long
7421 Leaves close half round channelled, Stem and branches erect thick
7422 Leaves lin round obtuse narrowed at each end, Old stem strumose at base, Branches effuse
7423 Branches filiform weak long prostrate, Old roots strumose above, Leaves lin furrowed longer than joints
7424 Leaves lin half round with shining pimples, Stems procumbent filiform
7425 Leaves half round pimpled hairy, Cal hairy, Stem thick, Branches diffuse knotty
7426 Leaves half round blunt channelled spreading iced, Branches diffuse weak cinereous
7427 Beautifully pimpled all over, Leaves half round, Branches knotty slender, Fl small dichotomous
7428 Stems and leaves cylindrical pimpled, Branches dichotomous
7429 Leaves expanded compressed 3-cornered somewhat hoary soft recurved at end mucronate
7430 Leaves half round somewhat triquetrous glaucous, Fl dichotomous testaceous, Stem erect shrubby
7431 Leaves subtriquetrous compressed minutely pimpled recurved at end, Old root tuberous large
7432 Leaves remote obsoletely cylindrical glaucous, Fl 2 ternate cymose, Bark white

7433 Leaves remote subcylindrical glaucous exactly half erect, Fl ternate, Bark cinereous
7434 Leaves half round, Pedunc terminal aggregate clavate cymose
7435 Leaves remote half cylindrical glaucous exactly horizontal, Fl ternate
7436 Leaves half cylindrical subul subacute incurved sparkling, Sepals and petals obtuse, Cor funnel-shaped
7437 Leaves half cylindrical obtuse subrecurved much sparkling, Sepals and petals subacute
7438 Leaves expanded remote blunt compressed subcylindrical, Stems very rough spotted
7439 Leaves half round narrowed at each end sparkling incurved erect variously bent, Branches filiform
7440 Leaves distant cylindrical blunt small shining pimpled one of each pair deflexed, Branches hard suberect
7441 Leaves graniform expanded bluntly 3-cornered papulose shining, Branches hard rough erect
7442 Leaves cylindrical blunt spreading short, Branches numerous diffuse filiform
7443 Leaves expanded very short or globose cylindrical, Branches numerous filiform divaricating decumbent
7444 Leaves cylindrical 3-cornered obtuse with white dots, Calyx 6-cleft
7445 Leaves cylindr very blunt and cal smooth obconical green pimpled sparkling, Stamens longer than styles

7446 Leaves close cylindrical blunt with crystalline pimples, Cal turbinate hairy, Stamens length of styles
7447 Leaves cylindrical incurved crystalline hoary blunt sparkling, Branches long weak procumbent
7448 Lvs subcylindr incurv pimpl obt Cal hemispheric pimpl hairy cluster Branch numerous spreading

and Miscellaneous Particulars.



Mr Haworth's arrangement of the genus, which is the only intelligible one, is here followed

Respecting the general culture of the genus, Sweet observes, "the dwarf kinds require but little water, and to be grown in small pots in a very sandy or gravelly soil The species should be kept quite dry when in a dormant state,

History, Use, Propagation, Culture,

but when growing freely, and at the flowering season, they require a moderate supply of water The stronger and more woody kinds may be planted in a richer soil, but the poorer the soil is, the dwarfer they will grow, and the more abundantly they will flower, they also require more water than the dwarf kinds, particularly at the flowering season, but need very little in winter A good dry frame is sufficient to preserve them through the winter, with the covering of mats in frosty weather Cuttings of any of them strike root readily, planted in pots of earth, and kept dry till they begin to wither, when they may have a little water, and they will root very soon (*Bot Cult* 224)

1147 *Hymenogyne* From *ὑμην*, a membrane, and *γυνη*, a woman, or, in botanical language, a style, in allusion to the cohesion of the styles into a membranous tube An artificial division of Mesembryanthemum

1148 *Rosa* From *rhos*, signifying red in Armorican, whence *ῥοδον*, Greek, and *rosa*, Latin The rose has been a favorite flower from time immemorial among the civilized nations of Europe and Asia The shrub varies in size in different species, from one foot to six or eight, and the colors are red, white, yellow, purple, striped, simple, or in almost numberless shades and mixtures, the flowers are single, semi-double, and double The odour is universally grateful It is cultivated in every garden, from that of the most humble cottager upwards, some species, as R centifolia, damascena, &c are also cultivated by commercial gardeners on a large scale for distilling rose water, and for making attar, or essential oil of roses Six pounds of rose leaves will impregnate by distillation a gallon of water strongly with their odor, but a hundred pounds affords scarcely half an ounce of attar The rose is also used in medicine Botanists are not agreed as to the number of

7449 Lvs subcylindr incurved pimpled obt. hoary, Cal hemispheric pimpled numerous, Stamens longer than
7450 Leaves cylindrical fine, Two sepals leafy much longer than the others [styles
7451 Erect, Leaves subulate half cylindrical, Cal. woolly, Stamens the length of styles

7452 Slender, Lvs half cylindr blunt or half round, Cal. hairy at base, Pedunc long and branches decumbent
7453 Branches, leaves, peduncles, and calyxes hispid

7454 Leaves obl ovate subtriquetrous gibbous, Sepals very unequal filiform ragged hispid the length of petals
7455 Leaves close depressed cylindrical hispid all over, Old root tuberous
7456 Procumbent, Leaves remote suboblong exactly half erect with 5 rays at end, Cal 5-cleft very irregular
7457 Erect decumbent, Leaves remote nearly oblong horizontal flat above with 6 rays at end, Cal 5-cleft equal
7458 Lvs tufted hoary thick half round pimpl. rough with many rays at end ciliated at base, Cal. 6-8-fid hairy

7459 Densely tufted, Leaves half round papulose rough with many rays at end, Cal 6-cleft very hairy
7460 Branches villous, Leaves horizontal, Root tuberous
7461 Branches erect decumbent hairy, Leaves with about 10 rays at end, Calyx with a black beard

7462 Leaves on long stalks spatulate lanceolate green

and Miscellaneous Particulars.

original species of this genus some regard all the European species as originated from one source, others, and especially the moderns, divide them into species, subspecies, and varieties The most scientific work which has appeared in England on roses is the Rosarum Monographia of Mr Lindley, 1819, in which above a hundred species or subspecies are described, and some of them figured; Miss Lawrence has published ninety plates of A Collection of Roses from Nature, 1810 In France, Guillemeau has published Histoire Naturelle de la Rose, 1800, and Redouté and Thory are engaged in a splendid work, in folio, entitled Les Roses, containing plates of all the known species and varieties of this flower Thory has published a separate tract on their culture, entitled Prodrome de la Monographie du Genre Rosier, &c 1820, Pronville, a Nomenclature Raisonnée, in 1818, and Vibert, Observations, &c., in 1820 A copious and intelligent account of the Scotch roses has been given by Mr Sabine (*Hort Trans* iv 231), and some hundreds of new varieties have flowered from seedling plants in the Hammersmith nursery, and will soon be found in the sale catalogues

Species and varieties The lists of the London and Paris nurserymen contain upwards of 500 names that of Calvert and Co., Englishmen, who have established a nursery at Bonne-Nouvelle near Rouen, enumerates near 900 sorts. The greater part of these have been raised, within the last thirty years, from seed on the continent, where it ripens better than in this country A number of varieties have also been raised in Britain, especially of the R spinosissima, or Scotch rose, of which above 300 varieties are procurable in the Glasgow nursery New varieties are raised in France and Italy annually, Villaresi, royal gardener at Monza, has raised upwards of fifty varieties of Rosa indica, not one of which has, as far as we know, reached this

History, Use, Propagation, Culture,

country Some of them are quite black, others shaped like a ranunculus, and many of them highly odoriferous The most remarkable only are here arranged under the species to which they are referable

A modern invention, of Dutch origin, in the culture of roses, is that of forming standards, by budding on stocks of any of the hardy woody growing sorts, as the dog rose, R canina, or the tree rose, R villosa. They are budded at different distances from the ground, according to taste and the purposes in view, and form, after a few years, handsome round heads, which flower freely, and preserve the variety a longer time than in plants raised from cuttings or layers They are particularly valuable for shrubberies and lawns, where the culture at the root required by dwarf roses could not be given, and if omitted would occasion the degeneracy of the variety

New varieties of the rose are obtained from seed, but the usual mode of propagation is by layers All will grow by cuttings, and some, as the sempervirens, freely, but that mode is seldom resorted to For preserving delicate varieties, the best mode seems decidedly that of budding on hardier sorts.

No species of rose, wild or cultivated, thrives well in or very near large towns, on account of the smoke and confined air The yellow and Austrian roses (R lutea and R bicolor) are difficult to flower in any situation, but seldom or never blow in the suburbs of London even the monthly rose does not thrive so well there as at some miles distance in the country Roses are generally planted in the front of shrubberies, and in borders, they are also planted by themselves in rose gardens or rosaries, in groups on lawn, either with common edgings, or with edgings of wire, in imitation of basket-work These last are called baskets of roses, the ground enclosed in the basket-margin is made convex, so as to present a greater surface to the eye, and increase the illusion, the shoots of the stronger sorts are layered or kept down by pegs till they strike roots

7479 Lvs very long, Petioles with a few glands and lanc leafl downy ben Sep very narr longer than pointed [petals

and Miscellaneous Particulars.

into the ground, so that the points of the shoots furnished with buds appear only above the soil, which is sometimes covered with moss or small shells Under this treatment, the whole surface of the basket becomes, in two or three years, covered with rose buds and leaves of one or of various sorts Where one of the larger free-growing sorts is employed, as the moss, or any of the Provence varieties, one plant may be trained so as to cover a surface of many square yards Where different sorts are introduced in the same basket, they should be as much as possible assimilated in size of leaves and flowers and habits of growth, and as different as possible in the colors of their flowers By mixing small-flowered with large showy sorts, the beauty of the former is lost without adding to the effect of the latter

In rosaries, commonly, but one plant of a sort is introduced, and the varieties which most resemble each other are placed together, by which their distinctions are better seen Particular compartments are often devoted to one species, as the Scotch, Chinese, yellow, burnet-leaved, &c which has an excellent effect, sometimes a piece of rock-work in the centre is covered with the creeping roses, and on other occasions these are trained to trellis-work, which forms a fence or hedge of roses round the whole In this hedge, standard roses are sometimes introduced at regular distances, a grove of standards is also frequently formed in the centre of the rosary, and sometimes they are introduced here and there in the beds

Standard roses, however, have certainly the best effect in flower borders, or when completely detached on a lawn their sameness of form, and that form being compact and lumpish, prevents them from grouping well, either among themselves or with other objects Their beauty consists in their singularity as rose plants, and in their flowers, and, therefore, to display these beauties to the best advantage, they require to be seen singly, or in succession This is the case where they occur as single objects on a lawn, or in the centre, and here and

History, Use, Propagation, Culture,

there among groups of flowers, or in lines or avenues, along flower walks In the gardens of the Grand Trianon, they are planted profusely in large masses, like plantations of trees and shrubs, and there much of their individual beauty is lost, and no good general effect produced.

Most species of the rose, in their wild state, grow in sandy and rather poor soil, except such as are natives of woods, where the soil is richer, and comparatively moist. But all the cultivated roses, and especially the double-flowering kinds, require a rich loamy soil, inclining to clay rather than sand, and they require also, like most double flowers, plenty of moisture when in a growing state.

To produce strong flowers, roses require some attention to pruning, old wood should be yearly cut out, and the young shoots thinned and shortened according to their strength, and whether number or magnitude of flowers be wanted Those sorts which throw up numerous suckers should be taken up every three or four years, reduced, and replanted, and most sorts, excepting the standards, will be improved by the practice, provided attention be paid to remove a part of the old soil, and replace it by new The points of the shoots

of the more delicate sorts of roses, are very apt to die when pruning is performed in winter or spring, to avoid the consequences of this evil, many give a second pruning in June, or do not prune the tender sorts at all till the beginning of that month A very good time for performing the operation, is immediately after the bloom is over, cutting out old exhausted wood, shortening shoots which have flowered to a good bud accompanied with a healthy leaf, but leaving such shoots as are still in a growing state untouched till October Where very large roses are wanted, all the buds but that on the extreme point of each shoot should be pinched off as soon as they make their appearance, and the plant liberally supplied with water To lessen evaporation, and keep up a constant moisture at the roots of their roses, the Paris gardeners generally mulch them with half-rotten stable-dung, or partially rotten leaves.

The earliest flowering rose is the monthly, which, in mild seasons, and planted against a wall, will sometimes flower in the beginning of April, the roses next in succession are the cinnamon, which flowers in May, the damask in the end of May or beginning of June, the blush, York and Lancaster, Provins, and Dutch

common mode of obtaining late roses, and one of the greatest antiquity, is by cutting all the flower shoots off when the buds begin to appear, or by rubbing off all the rudiments of shoots, of every kind, early in spring, a second crop is in consequence produced, which will not be in a state to bloom before the autumn.

The best roses for forcing are the common and moss Provence, the Indian sorts force well, or rather, in stoves, continue in bloom all the year, but the commoner varieties of these not being fragrant, they are in less repute than the European roses Rose plants should be a year in pots previously to the autumn when it is intended to force them, they should be planted in pots of six or eight inches diameter, in rich loam, and

History, Use, Propagation, Culture,

plunged in an open airy situation, their flower buds pinched off as they appear, and the plants put early into a state of rest, by excluding the sun and rain, but not a free circulation of air

All the species of roses are very liable to the attacks of insects, especially of the aphides, some, and especially the briar and Scotch rose, are attacked by the Cynips rosæ, which, by puncturing the bark, occasions the production of rose galls, and of those mossy tufts often seen on wild roses, which were known formerly under the name of Bedeguar, and used in medicine Under cover tobacco smoke will prove an effectual remedy for the aphides, but the larvæ of many others, and especially of tipula and the tenthredinidæ, which occasion the wrapping up and shrivelling of the leaves, can only be removed by washing with lime-water or hand picking

1149 *Rubus* From the Celtic *rub*, which signifies red Many of the species are only biennial woody plants, producing suckers or stolones from the roots, which ripen and drop their leaves one year, and resume their

and Miscellaneous Particulars

foliage, produce blossom shoots, flower, and fruit, and die the next. The common raspberry and bramble are examples

R. idæus is a native fruit, greatly improved by cultivation; it has a grateful subacid taste, and like the strawberry, is one of the few fruits that does not undergo the acetous fermentation in the stomach There are red and yellow varieties, and one very excellent sort that bears twice a-year, in July and September The raspberry requires a soft rich moist soil, and if a plant stands singly or a single row is planted by itself, the situation should be gently shaded Where a plantation is made of several rows together it may be placed in the open garden, as the plants will shade one another to a sufficient degree. Frequent renewal is necessary to prevent the stools getting large and matted when they send up only weak suckers No more suckers should be left at the stools than are intended to bear the following year, unless young plants are wanted, and if very

History, Use Propagation, Culture,

large fruit is the object, no suckers should be left at all on the contrary, when the strongest suckers are wanted, the fruit-bearing shoots should be cut down

R occidentalis is a showy plant for large shrubberies The fruit of R cæsius is blue, edible, and it continues till frost R corylifolius and fruticosus are both common in our hedges, the shoots of the latter are much tougher than those of the former, and are preferred by thatchers for binding their roofs, and by straw-hive and mat makers The berries, eaten at the moment they are ripe, are cooling and grateful, a little before, they are coarse and astringent, and a little after, disagreeably flavored or putrid They are sometimes made into pies, but great care is requisite in gathering the fruit, for one berry of the last sort will spoil a whole pie. The double-flowering variety is considered very ornamental

The fruit of R arcticus and chamæmorus is eaten in the north of Scotland and Sweden In the latter country, Dr Clarke informs us, it is much prized in soups, sauces, and for making vinegar, and Dr Clarke was cured of a bilious fever by eating great quantities The plant is rather difficult to preserve in gardens, but by raising successive generations from the seed it might perhaps be subjected to the same culture as the cranberry The fruit of R. pauciflorus, the Nepal raspberry, is very agreeable

1150 *Dalibarda* Denis Dalibard was a French botanist, who published, in 1749, a catalogue of the plants in the neighbourhood of Paris. Small plants, resembling the little species of Rubus

7556 Leaves simple cordate somewhat lobed downy beneath, Stem prickly decumbent
7557 Branches round villous, Lvs. cordate obl 5-lobed the middle lobe elongated, Stip and bractes pectinate
7558 Leaves 3-5 downy beneath, Stem peduncles and petioles with recurved prickles

** *Herbaceous.*

7559 Leaves tern naked, Runners creeping herbaceous, Panic few-flowered
7560 Leaves tern naked, Leafl rhomboid acute cut serrate the odd one stalked, Flowers about 3

7562 Leaves ternate, Stem unarmed 1-flowered
7563 Leaves simple lobed, Stem unarmed 1-flowered

7564 Leaves simple cordate crenate, Peduncles 1-flowered

7565 Leaves ternate, Leafl cuneate serrate-cut, Tube of cal obconical

7566 Cal of fruit reflexed, Pubescence of petioles spreading, of the peduncles appressed
7567 Leaves simple
7568 Cal of fruit erect, Pubescence of pedun erect, of petioles much spreading, Leaves downy on each side
7569 Cal of fruit reflexed, Pubescence of pedunc and petioles much spreading
7570 Large, Leaves broad oval, Pedic long recurved pendulous, Rtcept much excavated globose villous
7571 Cal of fruit spreading, Pubescence of petioles erect, of peduncles appressed, Leaves smoothish above
7572 Cal. of fruit erect, Pubescence of peduncles and petioles erect, Lvs smoothish above
7573 Cal. of fruit erect, Pubescence of peduncles and petioles much spreading, Lvs. villous on each side
7574 Outer sepals larger than the rest obovate 3-toothed

7575 Leaves pinn Petals smaller than calyx
7576 Leaves tern Petals larger than calyx

7577 Leaves pinnate, Leafl lin obl flat, Petioles long, Branches 1-2-fl
7578 Leaves pinnate, Leafl lin obl revolute at edge, Petioles short, Corymbs terminal
7579 Leaves interruptedly pinnate silky, Leaflets finely serrate, Stem creeping, Pedunc 1-fl
7580 Leaves ternate stalked, Leafl obovate cut serrate white with down beneath, Sepals ellipt Pet obcordate
7581 Rad lvs quinate cauline tern Leafl cuneate obl serrate, Stipules large adnate entire
7582 Leaves pinnate white with down beneath, Leafl serrate, Stem shrubby

7583 All over silky, Lvs interruptedly pinn Fl dichoto corymb Sepals ov acute, Stem erect nearly simple
7584 Lvs interruptedly pinn with spread hairs, Leafl lanc cut toothed, Stip cut, Pet obcord larger than cal.
7585 Lvs bipinnatifid in many pairs downy on each side segments parallel approximating, Stem decumbent
7586 Lvs bipinnatifid in four pairs smooth above downy beneath segments distant, Stem decumbent
7587 Leaves pinnate the outer largest, Runners creeping
7588 Rad leaves subpinn cauline tern Leafl lanc unequally coarsely serrate hairy on each side
7589 Leaves pinnate alternate, Leafl 5 ovate crenate, Stem erect
7590 Leaves pinnate nearly equal, Leafl oblong subbifid the outer confluent
7591 Leaves pinnate, Leafl roundish toothed equal, Stem erect
7592 Leaves pinnate upper ternate, Leafl deeply toothed, Stem erect pubescent
7593 Leaves pinnate, Leafl oblong deeply toothed, Stem decumbent dichotomous, Pedun axill. solitary
7594 Leafl 7-5 lanceolate coarsely toothed, Petals obcordate larger than calyx, Stem erect
7595 Leafl. 5 cuneiform cut downy beneath, Stem erect
7596 Radic leaves 5-nate, Cauline ternate, Stem nearly erect much branched
7597 Lvs. 5-nate with adpressed hairs of the branches ternate, Leafl obl cuneate deeply toothed, Stem ascend.

and Miscellaneous Particulars

1151 *Fragaria* From *fragrans*, in allusion to the perfumed fruit *Fraisier*, Fr., *Erdbeere*, Ger., and *Tragolo*, Ital. This is a genus of fruit-bearing herbaceous plants, of which there are few in the vegetable kingdom, and none to equal the strawberry in wholesomeness and excellence This fruit is universally grateful, alone, or with sugar, cream or wine, and has the property, so valuable for acid stomachs, of not undergoing the acetous fermentation. Besides the species or subspecies enumerated, there are upwards of sixty mongrel varieties or different names, some of which, recently produced from seed, are of great excellence The strawberry is not only a valuable and easily cultivated out-door fruit, but forces well, and with a little trouble in choosing a succession of sorts, they may be had at the dessert every month in the year, though during the three winter months they are without flavor

In cultivating the strawberry an open situation and rich loamy soil, rather strong, is required for most varieties; and from their large mass of foliage and flowers, they must, till the fruit is set, have copious supplies of water. The row culture is most convenient, and frequent renewal insures vigorous plants and large fruit

1152 *Comarum* A name given by the Greeks to the Arbutus. The Comarum of the moderns produces a fruit not unlike that of the Arbutus

1153 *Potentilla* In allusion to its supposed *potential* virtues in medicine These, however, appear to con-

History, Use, Propagation, Culture,

sist of nothing beyond a slight vulnerary quality P fruticosa and floribunda are shewy shrubs P anserina is remarkable for the silvery whiteness of its foliage, which is eaten by geese, as the roots were once by the country people in some places All the species are pretty, and deserving cultivation

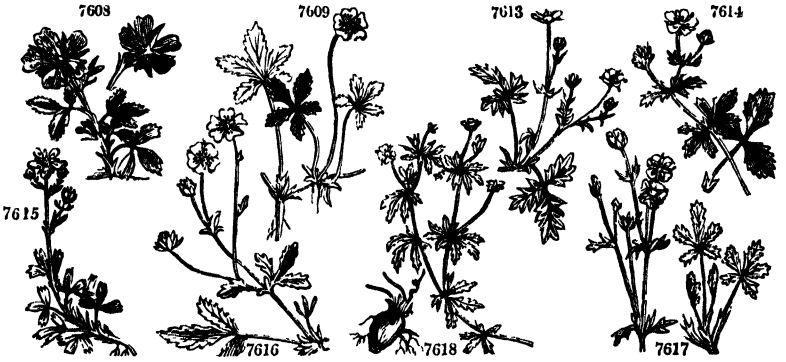
1154 *Tormentilla* From *tormina*, the dysentery, which this plant was formerly employed for curing T erecta was once a plant of some importance in œconomy and medicine The roots are still used in most of the Western Isles of Scotland and in the Orkneys for tanning leather, for which they are superior even to oak-bark They are first boiled in water, and the leather is then steeped in the cold liquor In the islands of Tirey and Col, the inhabitants have destroyed so much ground by digging them up, that they have been prohibited the use of them They are also used for dying of a red color And Mr. Young informs us, that many swine are reared with them on the mountains of Killarney

In the London Materia Medica it is employed in intermittents, and as a local application in the form of gargle and lotion, in ulcerations of the tongue and mouth, against spongy gums, and as an application to fœtid ill conditioned sores, but it is seldom used. (*London Dispensatory*, 538.)

1155. *Geum.* From γεύω, to taste well The roots of G urbanum have a mildly astringent aromatic taste, somewhat like that of cloves, whence this plant has the name of Caryophyllata. They should be gathered in dry warm situations, for in shady moist places they have little virtue. Gathered in the spring, and put fresh into ale, they give it a pleasant flavor, and prevent its turning sour. Infused in wine, it is esteemed a good

7598 Leafl 5-7 cuneiform cut pilose, Stem erect hairy
7599 Leafl 7 sessile seated upon a dilated stipule
7600 Rad. lvs 5-7 lin cuneiform toothed, Petals retuse the length of calyx, Stems filiform decumbent hairy
7601 Leaves 5-nate obovate toothed pubescent, Pet. obcord. larger than calyx, Stems declinate
7602 Rad lvs. 5-nate, Leafl cuneif ciliate 5-toothed at end, Caul 3-nate subsess Pet obcord. larger than calyx
7603 Rad lvs 5-nate oblong toothed upper 3-parted, Cor larger than calyx, Stem ascending
7604 Leaves 5-nate with connivent serratures at end, Stems filiform procumbent, Recept. hairy
7605 Leaves 5-nate with connivent serratures at end, Stems many-fl decumbent, Recept. hairy, Pet obovate
7606 Leaves 5-nate with connivent serratures at end, Stems many-fl decumbent, Recept. hairy, Pet roundish
7607 Leaves 5-nate silky on each side, Leafl obovate bluntly toothed at end, Pet. length of cal. Recept. woolly
7608 Leaves subtern downy with 3 connivent teeth, Stems 1-fl. Recept. woolly
7609 Leaves 5-nate, Stem creeping, Pedunc 1-flowered
7610 Leaves 5-nate obovate coarsely serr Stip cut bifid, Pedunc 1-fl axill. Stem producing runners
7611 Rad lvs subpinnate cauline ternate, Leafl lanc unequally and coarsely serrated with spreading hairs on [each side
7612 Leaves ternate, Stem branched erect, Peduncles with a knee at base
7613 Leaves ternate cut downy beneath, Stem ascending
7614 Leaves ternate, Stem dichotomous, Pedunc axillary
7615 Leaves ternate cuneiform 3-fid at end
7616 Leaves ternate toothed hairy on both sides, Stem decumbent longer than leaves

7617 Stem creeping, Leaves stalked
7618 Stem nearly erect, Leaves sessile



7619 Fl erect, Awns hooked naked, Caul lvs pinn Leafl. and stipules split, Petals longer than calyx
7620 Fl erect, Lvs pinn Leafl nearly equal irregularly cut toothed, Stip ovate nearly entire Pet oval length of [calyx
7621 Fl erect, Rad lvs pinn cauline tern upper simple, Lower stip cut, Pet length of calyx
7622 Fl. erect, Awns hooked naked, Caul lvs tern upper lanc Petals shorter than calyx
7623 Fl. erect, Awns hooked naked hairy at end, Rad lvs lyrate pinnate terminal pinnate cordate
7624 Fl erect, Awns hooked naked, Caul lvs tern radical lyrate pinnate
7625 Fl nodd. Pet length of cal Awns hooked naked, Grains hairy, Rad lvs lyrate pinn · cauline ternate
7626 Fl nodd. Pet length of cal Awns feathery twisted in the middle
7627 Fl nodd Cal leafy longer than the polypetalous corolla
7628 Fl. nodd. Pet longer than cal. Awns hairy twisted at base, Rad lvs lyrate pinnate cauline simple trifid

7629 The only species

7630 Leaves oblong downy beneath
7631 Leaves lanceolate smooth on each side glaucous beneath
7632 Sepals lanc Lvs obl acute by degrees somewhat rugose smooth and green on each side, Branches very [straight and erect

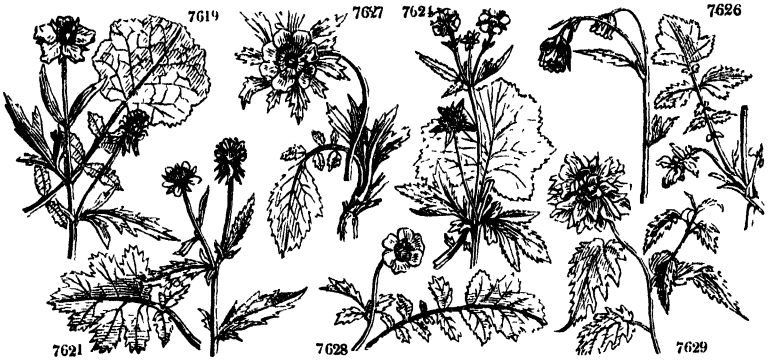
7633 The only species Fl small very fragrant pale yellow appearing in the winter

7634 Leaves toothed

and Miscellaneous Particulars.

stomachic; but in water, Haller affirms it to have been attended with bad effects, when given in malignant fevers, producing delirium. Chewed in the mouth, the roots take off from a disagreeable breath

1156 *Kerria.* So named after Mr William Ker, a botanical collector, who was sent some years since to China, whence he sent many curious plants The plant named after him is the common Corchorus japonica of the gardens.



1157 *Calycanthus* From καλυξ, and ανθος, a flower, the calyx being colored and similar to petals, which are not present in the genus Small North American shrubs, with chocolate-colored blossoms. The flowers of C floridus have an agreeable scent like those of allspice, and is so called in Carolina.

1158 *Chimonanthus* From χειμων, winter, and ανθος, a flower, in allusion to the period of the year when its blossoms are produced. C fragrans is highly odoriferous, and though hardy, deserves a place in the front border of a conservatory, on account of the odor it disperses early in spring

1159 *Dryas* A name poetically applied to this little plant, from the resemblance of its leaves to those of the oak, which was sacred to the Dryads. This is a delicate evergreen plant, and with its snow-white blossoms is a great ornament to alpine heights. The stalk and branches are woody and perennial, lying flat upon the ground, and spreading wide about the root in tufts

It requires some care to preserve it in gardens, and grows better in a shaded bed of peat than in pots.

History, Use, Propagation, Culture,

1160 *Coluria* From κολιὸς, deprived of the tail, or, as we usually say in English, bob-tailed Distinguished by Mr Brown from Geum, principally on account of the deciduous nature of the style or tail of the grains.

Class XIII. — POLYANDRIA. Stamens many, hypogynous, or inserted under the Ovary.

This class agrees with the last in having hermaphrodite flowers, with an indefinite number of stamens, which neither cohere in any part of their length, nor are distributed in distinct parcels, but it is distinguished by the stamens being inserted distinctly from the floral envelopes, immediately under the ovary, into what has been called the *receptacle* by Linnæus and his followers, *torus*, by Mr Salisbury, and *thalamus*, by some other botanists The class consists of the greater part of several extensive natural orders, such as Ranunculaceæ, Magnoliaceæ, Cistineæ, &c , and, like the last, is replete with subjects of interest to gardeners and florists The various kinds of Clematis form the most valuable portion of the hardy climbing plants of the verandah The brilliant varieties of the ranunculus and anemone constitute the most attractive part of the flower garden Pæonia, well known for the richness of its coloring, and the robustness of its constitution, is the ornament of every cottage, and the noble varieties of Magnolia, the pride of the North American forest, are the finest exotics of the shrubbery Nymphæa and Nelumbium are beautiful genera of aquatic plants Annona, or the custard apple, is one of the most important of the fruit trees of tropical countries, and the celebrated water vine of Sierra Leone is a species of Tetracera Nor must Sarracenia, with its curious pitcher-like leaves, Papaver, from which opium is extracted, Cimicifuga, whence is obtained the antidote to the dangerous bite of the rattle-snake, Bixa, or the arnotta tree, from the fruit of which the coloring matter for the red cheese of England is procured, nor Hepatica, with its modest beauties, be omitted.

The commencement of M Decandolle's laborious Systema Vegetabilium has included nearly every thing contained in the class, and is followed in the discrimination of the species, as being the best authority which can be taken.

Order 1. MONOGYNIA  Stamens many, hypogynous Style 1

1162. *Capparis* Cal 4-leaved, coriaceous, deciduous Petals 4 Stamens long. Stigma capitate. Berry with a rind, 1-celled, stalked, subglobose, or like a pod

1163 *Marcgraavia* Cal 6-leaved, imbricated. Corolla monopetalous, calyptriformis. Berry many-celled, many-seeded. Style O

1164. *Actæa.* Cal 4-leaved, deciduous Petals 4. Berry 1-celled Seeds half orbicular

1165. *Sanguinaria.* Cal 2-leaved Petals 8 Pod ovate, 1-celled

1166. *Podophyllum.* Cal 3-leaved Petals 9 Berry 1-celled, crowned with the stigma

1167. *Chelidonium* Cal 2-leaved Petals 4 Pod 1-celled, linear Dissepiment O. Seeds several, crested

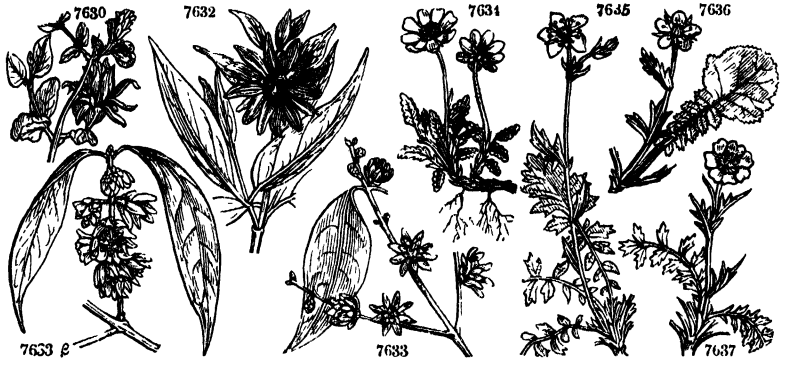
1168 *Romeria* Petals 4 Caps long, 2-3-4-valved, the valves opening from the vertex to the base. Seeds reniform, scurfy, without a glandular crest

1169. *Glaucium.* Cal. 2-leaved Petals 4 Pod 2-celled, linear, 2-3-valved. Seeds several, dotted.

1170. *Papaver.* Cal 2-leaved Petals 4 Capsule 1-celled, opening by pores under the persistent stigma

1171. *Meconopsis.* Petals 4 Style short. Stigmas 4-6, radiating, convex, distinct. Capsule opening with 4-6 valves.

1172. *Argemone* Cal 3-leaved Petals 6 Capsule half valved



1173 *Sarracenia.* Cal. double, 3-5-leaved Petals 5 Caps 5-celled Style with a clypeate stigma.

1174. *Nymphæa.* Sepals at the base of the discus Petals and stamens connected with the whole of the discus, which covers the carpella.

1175. *Limnocharis.* Sepals 3. Petals 3, very delicate, withering Plant monocotyledonous.

7635 Stem about 2-flowered, Awns straight naked, Cal of fruit erect, Lvs pinnate toothed

7636 Leaves pinnate the outer leaflet very large round, lower smaller by degrees
7637 Leaves pinnate cut, Runners creeping

and Miscellaneous Particulars

1161. *Sieversia* Named by Willdenow, after M Sievers, a well known Russian botanical collector Plants resembling Geum in habit.

1176 *Nuphar* Sepals, petals, and stamens inserted at the base of the discus
1177 *Euryale* Sepals, petals, and stamens united with the discus, which covers the carpella.
1178 *Bixa.* Cal 5-toothed Petals 10 Capsule hispid, 2-valved
1179 *Pyrckia* Cal 3-leaved, besides two extra leaves at base Cor O Berry 5-angled, many-seeded.
1180 *Sloanea* Cal 1-leaved, 5-cleft Cor O Anthers united to filaments beneath the end. Caps echinate, 3-6-celled, 3-6-valved. Seeds 2, with a berried arillus
1181. *Apeiba* Cal 5-leaved Petals 5 Caps echinate, many-celled
1182 *Spurmannia* Cal 4-leaved Petals 4 Filaments cohering at base, torulose Capsule echinate, 5-angled, 5-celled Cells 2-seeded
1183 *Entelea* Sepals 4-5 Petals 4 Stamens indefinite, uniform Anthers roundish, incumbent Stigma denticulate Caps roundish, echinate, 6-celled, half 6 valved, many-seeded.
1184 *Muntingia* Cal 5-parted Petals 5 Berry 5-celled, 1-5-many-seeded
1185 *Grewia* Cal 5-leaved, coriaceous, colored inside Petals 5 Scales 5 Ovary usually stalked. Drupe 4-lobed, 4-celled Nut 1-4-seeded
1186 *Tilia* Cal 5-parted Petals 5 Capsule coriaceous, globose, 5-celled, 1-valved, opening at base, 1-seeded
1187 *Corchorus* Cal 5-leaved, deciduous Petals 5 Style scarcely any Stigma 1-3 Capsule pod-shaped, 2-celled, 2-5-valved, many-seeded
1188 *Grias* Cal 4-cleft Petals 4 Stigma sessile, cruciate Drupe with an 8-furrowed nut
1189 *Calophyllum* Cal 4-leaved, colored Petals 4 Drupe globose
1190 *Mammea* Cal. 2-leaved Petals 4 Berry very large, 4-seeded
1191 *Ochna* Cal 5-leaved Petals 5 Berries 1-seeded, with a large roundish receptacle
1192. *Elæocarpus* Cal 5-leaved Petals 5, torn Anthers 2-valved at end Drupe with a curly nut.
1193 *Alangium* Cal 6-10-toothed, superior Petals 6-10, linear Berry coated, 1-3-seeded
1194 *Mentzelia* Cal 5 leaved Petals 5 Capsule inferior, cylindrical, many-seeded
1195 *Lagerstroemia* Cal 6-cleft, campanulate Petals 6 Stamens many, of which the six outer are the kest Caps 4-6-celled, many-seeded
1196. *Ægle* Cal 1-leaved, 5-lobed Petals 5, spreading Style short, thick. Berry coated, turbinate, globose, finally woody, with 12-16 cells
1197 *Cistus* Cal 5-leaved, with two small leaflets Petals 5 Caps 5-celled, the valves bearing the dissepiments in the middle
1198 *Helianthemum* Divisions of the calyx often unequal the two outer the smallest Caps 1-celled, 3-valved, with the dissepiment in the middle of the valves

Order 2 DI-TRIGYNIA  Stamens many, hypogynous Styles 2-3.

1199 *Bauera* Cal 7-9-leaved, persistent Petals 7-9, deciduous Caps inflated, 2-celled, many-seeded.
1200 *Fothergilla* Cal truncate, entire Cor O Filaments very long, clavate Ovary bifid. Caps 2-celled, 2-horned Seeds solitary, bony
1201 *Curatella* Cal 5-leaved Petals 4 Styles 2 Caps 2-parted Cells 2-seeded.
1202 *Paeonia* Cal 5-leaved Petals 5 Style O Caps many-seeded, like a pod
1203 *Hibbertia* Stamens distinct, filiform, equal Anthers oval, oblong. Ovaries 1-15 Styles filiform, inflexed Carpella membranous, generally 1-2-seeded
1204 *Delphinium* Cal O Petals 5 Nectary bifid, cornute behind Siliques 3-1
1205 *Aconitum.* Cal O Petals 5, the upper vaulted Nectaries 2, hooded, stalked, recurved. Siliques 3-5
1206. *Trachytella.* Carpella 1-2, berried, many-seeded; otherwise Tetracera.

Order 3. PENTAGYNIA.  Stamens many, hypogynous. Styles 5

1207. *Cimicifuga.* Cal 4-leaved Cor. with four urceolate nectaries. Caps 4. Seeds scaly
1208. *Aquilegia* Cal O Petals 5 Nectaries 5, horned between the petals Caps 5, distinct

1209. *Nigella.* Cal. 0 Petals 5. Nectaries 5, trifid between the corolla.
1210. *Reaumuria* Cal 5-leaved Petals reflexed, 5 Caps 5-celled, 5-valved, many-seeded. Seeds woolly
1211. *Colbertia* Ten stamens much longer than the others Carpella 5, united? Stigma capitate Seeds several in each cell, reniform, inclosed in a pellucid pulp
1212 *Tetracera* Flowers often dioecious or polygamous Carpella 3-5, capsular, surrounded by the imbricated sepals. Seeds 1-2, shining, ovate, with an arillus

Order 4. POLYGYNIA.  Styles many. Stamens many, hypogynous.

1213 *Nelumbium* Cal 4-5-leaved. Petals many Fruit turbinate, in a truncate discus, with several 1-seeded hollows Nuts ovate, crowned with the persistent style
1214 *Dillenia* Cal 5-leaved Petals 5 Capsules many-seeded, connate, replete with pulp
1215 *Illicium* Cal 6-leaved Petals 27 Caps many, placed in a circle, 2-valved, 1-seeded.
1216. *Liriodendron.* Cal 3-leaved. Petals 6. Samaræ imbricated in a cone Caps 1-2-seeded, not opening, attenuated
1217 *Magnolia* Cal 5-leaved. Petals 6-9. Caps 2-valved, 1-seeded, imbricated in a cone. Seeds pendulous
1218 *Michelia* Cal 3-leaved Petals 15 Berries many, 4-seeded
1219 *Uvaria* Cal 3-leaved Petals 6 Berries numerous, pendulous, 4-seeded
1220 *Annona* Sepals 3, united at base, concave, cordate, acute Petals 6, thick; the interior thicker or none Anthers subsessile, with a dilated angular end Berry pulpy, many-celled towards the outside
1221 *Artabotrys* Cal 3-parted Petals 6 Stamens hypogynous Ovaries distinct, 2-seeded. Berries 2-seeded Seeds collateral erect, without arillus
1222 *Guatteria* Sepals 3, united at base, ovate, subcordate, acute. Petals 6, ovate or obovate. Berries dry, coriaceous, ovate or subglobose, stalked, 1-seeded
1223 *Asimina* Cal 3-parted Petals 6, spreading, ovate-oblong, the inner smallest. Anthers subsessile. Berries usually 3, sessile Seeds several

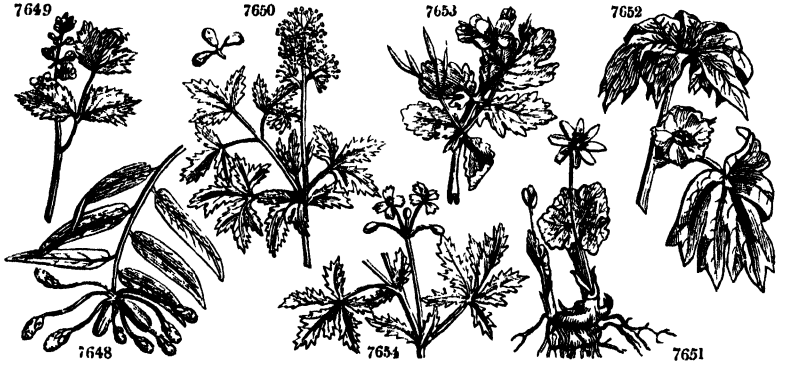
History, Use, Propagation, Culture,

1162 *Capparis* From its Arabic name *Kabar*, from which the Greeks made καππαρις *Capparis*, Fr *Capsolo*, Ital and *Kapernstrauch*, Ger This is a genus of low shrubs, some of which produce berries and others pods C spinosa has the habit of the common bramble, it grows in similar situations in the south of Europe, and especially on rocks and ruins The chief supply of caper buds is from Sicily, but the plant is cultivated in the neighbourhood of Toulon in orchards, in the intervals between fig and olive trees, and in the neighbourhood of Paris, where it is trained on low walls, and the shoots during winter laid down and covered with soil to protect them from the frost In this country it is generally treated as a stove plant, though it has stood the winter in the open air in some situations, and by raising from the seed for several generations might probably be naturalized A plant stood near a century against the wall of the garden of Camden House, Kensington, it produced many flowers annually, though the young shoots were frequently killed to the stump during winter



As a pickle, the flower buds of the caper are in great esteem throughout Europe In Italy, the unripe fruit is prepared in the same way as the flower buds, both are highly acrid and burning to the taste. In the isles of the Mediterranean, and near Toulon, the flower buds of the caper are gathered just before they begin to expand, which forms a daily occupation during six months, when the plants are in a flowering state As the buds are gathered they are thrown into a cask among as much salt and vinegar as is sufficient to cover

1224. *Xylopia* Cal. 3-5 lobed Petals 6, the exterior largest. Stamens usually inserted in a globose receptacle Berries 2-15, on short stalks, compressed, frequently dry and opening Seeds shining
1225 *Hepatica* Invol 3 leaved, 1-flowered, resembling a calyx, entire. Sepals petaloid, 6-9, arranged in 2 or 3 rows Ovaries many Grains without an awn
1226 *Anemone.* Invol 3-leaved, distant from the flower, cut Sepals 5-15, petaloid Petals O.
1227 *Clematis* Invol O, or like a calyx under the flower. Sepals 4-8, colored Petals O, or shorter than the sepals Grains terminating in a feathery awn
1228 *Naravelia* Petals 6-12, longer than calyx Grains seated on a thick hollow stalk
1229 *Thalictrum* Invol. O Petals O Grains dry, not awned, sometimes stalked, sometimes with a longitudinal furrow
1230 *Adonis* Sepals 5, appressed Petals 5-15, with a naked claw Grains many, 1-seeded, spiked, ovate, pointed with the persistent hardened style
1231 *Knowltonia* Sepals 5. Petals 5-15, with a naked claw. Ovaries upon a globose receptacle. Grains 1-seeded, berried, with a deciduous style
1232 *Ficaria* Sepals 3, deciduous Petals 8, with a honey-pore at base. Grains obtuse
1233 *Ranunculus* Sepals 5, not deciduous. Petals 5, rarely 10, with a honey-scale at base. Grains pointed
1234 *Trollius* Sepals colored, 5-10-15, deciduous, petaloid Capsules many, subcylindrical, many-seeded.
1235 *Isopyrum* Sepals 5, deciduous Petals 5, equal, tubular, 2-lipped. Ovaries 2-20 Capsules compressed, membranous, many-seeded Seeds minute, dotted
1236. *Eranthis* Involucre under the flower, cut into many divisions Sepals 5-8, colored, oblong, deciduous. Petals 6-8, tubular Capsules stalked Seeds globose
1237. *Helleborus* Sepals 5, persistent, roundish, obtuse, large, usually green Petals 8-10, tubular, nectariferous. Stigmas orbicular Capsules coriaceous
1238 *Coptis.* Sepals 5-6, colored, petaloid, deciduous Petals small, cucullate. Stamens 20-25 Caps. 6-10, on long stalks, membranous, 4-6-seeded
1239 *Caltha* Sepals 5, colored, round. Petals O Stamens many Capsule spreading, 1-celled, many-seeded
1240 *Hydropeltis* Sepals 3-4 Petals 3-4 Ovaries 6-18 Seeds in a pendulous ovate globose capsule
1241 *Hydrastis* Sepals 3, ovate. Petals O. Carlopsides berried, many in a head, terminated by the style, 1-celled, 1-2-seeded.

MONOGYNIA.

7647 Pedunc umbelled, Leaves persistent lanceolate downy beneath, Flowers octandrous

7648 Leaves ovate-oblong acuminate veiny

and Miscellaneous Particulars.

them, and as the supply of capers is increased more vinegar is added When the caper season closes, the casks are emptied, and the buds sorted according to their size and color, the smallest and greenest being reckoned the best, and put into small casks of fresh vinegar for commerce. They will in this state keep fit for use for five or six years It is said to be a common practice to put filings of copper in the first pickle to save vinegar, and give the buds a green color The best capers are called nonpareilles, and the second best capucines (*N. Cours complet d'Agr*, art *Caprier*)

Most of the species are very shewy when in flower · C cynophallophora has large petals, and stamens upwards of four inches long Ripe cuttings of all the species grow readily in sand

1163 *Marcgravia.* In memory of George Marcgraaf, of Leibstadt, author of a voyage to Brazil in 1648 A sub-parasitical creeping shrub at first it is radicant like some ferns, but as it advances, the stem becomes shrubby, adhering still by its fibres to the trunk of some tree, to the top of which it frequently runs, at length dividing into several subdivided loose pendulous branches, commonly terminated by flowering umbels It is frequent in the cool wooded mountains of Jamaica, and, according to Browne, *appears in such various forms*, that it has been mistaken for different plants in the different stages of its growth. It grows freely in British stoves, and cuttings root in sand under a glass. The genus is remarkable for the transformation of part of the bractes into fistular bodies, resembling the pitchers of some other plants.

History, Use, Propagation, Culture,

1164 *Actæa* Aκτη was the Greek name of the elder, which this plant resembles in foliage and fruit Weed-like plants seldom seen in gardens The berries of A. spicata are poisonous, and with alum yield a black dye. The tubers of A racemosa are called snake root, and much used in North America by self-practitioners, and as an antidote against poison and the bite of the rattle snake

1165 *Sanguinaria* From *sanguis*, blood All parts of the plant on being wounded discharge a blood-colored fluid. This is a singular and very delicate looking plant. It has a tuberous fleshy root with red fibres and a reddish juice from each bud of the root there springs only a single fig-like glaucous leaf, with a one-flowered scape, the flower has no smell, and is very fugacious It abounds in the woods of Canada, and in the back settlements, where the Indians stain themselves with its red juice

1166 *Podophyllum* From πους ποδος, a foot, and φυλλον, a leaf, in allusion to the long firm stalk on which the leaves are placed Low neat herbaceous plants, with white flowers hidden by the overshadowing broad leaves

1167 *Chelidonium* From χελιδων, the swallow, because it was thought to flower with the arrival of that bird, and to perish with its departure The English word celandine appears to be a corruption of chelidonium The juice of C majus is of an orange color and very acrimonious It cures tetters and ringworms Diluted with milk it consumes white opake spots on the eyes It destroys warts, and cures the itch There is no doubt but a medicine of such activity will one day be converted to more important purposes (*Wstherng*) The root, according to Loureiro, is extremely bitter, and greatly esteemed among the natives of Cochin-China, for a variety of uses in medicine

1168 *Romeria* Named after J J Römer, professor of botany at Landshut, and the collaborator of Schultz in an edition of the Species Plantarum of Willdenow He died in 1820 A genus intermediate between Chelidonium, Glaucium, and Papaver

1169 *Glaucium* All the parts of the species appear covered with a *glaucous* bloom. Handsome sea-coast plants G luteum has large and numerous flowers, which, although of short duration, succeed one another in great abundance during most part of the summer, make a fine contrast with the sea-green dew-bespangled leaves, and are a great ornament to our sandy shores The whole plant abounds in a yellow juice, is fœtid, and of a poisonous quality, and said to occasion madness.

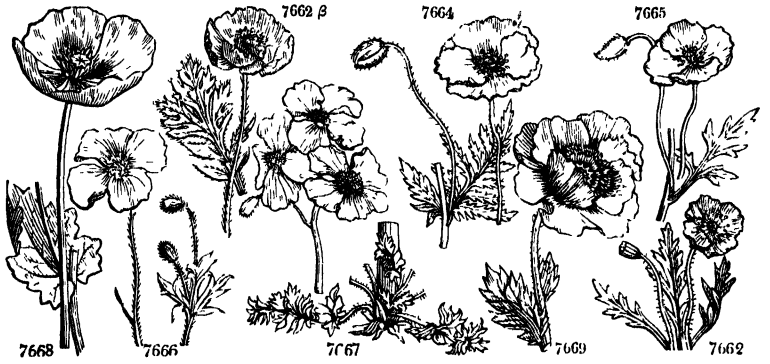
1170 *Papaver* Said by De Theis to have been so called from the Celtic *papa*, which signifies *pap*, or the soft food given to children, in which the seeds were formerly boiled to make the infants sleep Opium is derived from οπος, juice, it is supposed to have been the Nepenthes of Homer Rhœas, the name of one of the species, is from ρεω, to flow or fall, in allusion to the quickly perishable nature of the flowers The poppy produces a great quantity of seeds, for which reason Cybele, the mother of the gods, is represented crowned with poppy-heads as a symbol of fecundity

The species of this genus are all shewy, with large, brilliant, but fugacious flowers They are all easy of culture in almost any soil, and one species affords that singular medicine opium P. Rhœas is one of the commonest weeds among corn on gravelly soils, but in its double and semidouble variegated varieties, it is also one of the handsomest of garden annuals The capsules, as in P somniferum, contain a milky juice of a narcotic quality: an extract from them has been successfully employed as a sedative, and some foreign practitioners are said to prefer this extract to opium

P. somniferum, although it is found growing wild in the southern parts of Europe, and even in England, yet there is every reason for thinking that its seed must have been carried to these parts from Asia. It was very early cultivated in Greece, perhaps at first solely for the sake of its seed, which was used as food. It is extensively cultivated in most of the states of Europe in the present age, not only on account of the opium,

7649 Berries roundish, Petals length of stamens, Raceme ovate, Leaves 2-3 ternate
7650 Berries ovate-oblong, Petals shorter than stamens, Raceme ovate, Leaves bi-triternate

7651 The only species



7652 Stem erect 2-leaved 1-flowered, Fruit ovate

7653 Peduncles umbelled, Leaves pinnated with roundish toothed lobed segments, Petals elliptical entire
7654 Peduncles umbelled, Leaves pinnated with finely cut segments, Petals serrated or cut

7655 Pods 3-4-valved erect with rigid bristles at end

7656 Stem smooth, Cauline leaves repand, Pod warted roughish
7657 Stem smooth, Cauline leaves roundish sinuated, Pods rough, Flowers subsessile
7658 Stem hairy, Cauline leaves pinnatifid cut, Pod bristly

7662 Caps hispid, Scape 1-fl naked hispid, Leaves simple pinnate sinuated

and Miscellaneous Particulars

for which it is reared in Turkey, Persia, and India, but also on account of the capsules, and of the bland oil obtained from the seeds All the parts of the poppy contain a white, opaque, narcotic juice, but it abounds more in the capsules hence these are the only officinal parts of the plant, and for them chiefly is the plant cultivated in this country They are gathered as they ripen, and as this happens at different times, there are annually three or four gatherings They are brought to market in bags, each containing about 3000 capsules, and sold to the druggists The London market is chiefly supplied from Mitcham in Surrey

The milky juice of the poppy, in its more perfect state, which is the case in warm climates only, is extracted by incisions made in the capsules, and inspissated, and in this state forms the opium of commerce The mode of obtaining it appears to have been nearly the same in the time of Dioscorides as is at this day adopted The plants, during their growth, are carefully watered and manured, the watering being more profuse as the period of flowering approaches, and until the capsules are half grown, when it is discontinued, and the collection of the opium commences At sunset, longitudinal incisions are made upon each half-ripe capsule, passing from below upwards, and not penetrating to the internal cavity The night dews favor the exudation of the juice, which is collected in the morning by women and children, who scrape it from off the wounds with a small iron scoop, and deposit the whole in an earthen pot, where it is worked by wooden spatules in the sunshine, until it attains a considerable degree of thickness It is then formed by the hand into cakes, which are laid in earthen basins to be further exsiccated, when it is covered over with poppy or tobacco leaves Such is the mode followed in India, and according to Kampfer's account, nearly the same is practised in Persia, and when the juice is drawn in a similar manner in this country and inspissated, it has all the characters of pure opium

Opium is brought to this country in chests from Turkey and India The Turkey opium is in flat pieces, covered with leaves East Indian opium is in round masses, covered with the petals of the poppy in successive layers, to the thickness nearly of one-fourth of an inch Mr Kerr relates, that at Babar, it is frequently adulterated with cow-dung, the extract of the poppy procured by boiling, and various other substances In Malava it is mixed with oil of sesamum, which is often one half of the mass, ashes and the dried leaves of the plant are also used It is also adulterated with the aqueous extract of the capsules, the extracts of Chelidonium glaucum, Lactuca virosa, and Glycyrrhiza glabra, and sometimes with gum arabic, tragacanth, aloes, and many other articles

Poppy heads or capsules possess anodyne properties, they are chiefly employed, boiled in water, as fomentations to inflamed and ulcerated surfaces, and a syrup, prepared with the inspissated decoction, is used as an anodyne for children, and to allay the tickling cough in chronic catarrh and phthisis.

Opium operates as a powerful and very diffusible stimulus, but its primary operation is followed by narcotic and sedative effects in a degree much greater than could be expected from the previous excitement it induces It acts directly on the nervous system, and when taken into the stomach destroys irritability, and allays pain in the most distant parts of the body, independent of the circulation, and without inducing any change on the composition of the blood As the principle, therefore, on which opium acts is the same over all the body, the topical application of it is capable of producing similar effects, only in a diminished degree, to those resulting from it when it is taken into the stomach.

In moderate doses, opium increases the fulness, the force, and the frequency of the pulse, augments the heat of the body, quickens respiration, and invigorates both the corporeal and mental functions, exhilarating even to intoxication, but by degrees these effects are succeeded by langour, lassitude, and sleep, and in many instances headach, sickness, thirst, tremors, and other symptoms of debility such as follow the excessive use

History, Use, Propagation, Culture,

of ardent spirits, supervene In very large doses the primary excitement is scarcely apparent, but the pulse seems to be at once diminished, drowsiness and stupor immediately come on, and are followed by delirium, sighing, deep and stertorous breathing, cold sweats, convulsions, apoplexy, and death The appearances on dissection are those which indicate the previous existence of violent inflammation of the stomach and bowels, but notwithstanding the symptoms of apoplexy which an overdose, when it proves fatal, occasions, no particular appearance of an inflammatory state or fulness of the vessels of the brain are perceived

The Turks call opium *afiom*, and in the *tersakhana*, or opium shops of Constantinople, they take it in graduated doses from ten grains to one hundred grains in a day It is mixed with rich syrup and the inspissated juices of fruit, to render it more palatable and less intoxicating, and is taken with a spoon, or made up into small lozenges stamped with the words, Mash Allah, literally, "The work of God" The Tartar couriers, who travel great distances, and with astonishing rapidity, take nothing else to support them during their journeys (*Dallaway's Constantinople*, quarto, 78) There is, however, some reason for supposing that the Mash Allah, or Maslach of the Turks, contains other narcotics, as those of hemp and of lolium, as well as opium

The use of opium for the purpose of exhilarating the spirits has long been known in Turkey, Syria, and China, and of late years it has been unfortunately adopted by many, particularly females, in this country Russell says, that in Syria, when combined with spices and aromatics, he has known it taken to the amount of three drachms in twenty-four hours Its habitual use cannot be too much reprobated It impairs the digestive organs, consequently the vigour of the whole body, and destroys also gradually the mental energies The effects of opium on those addicted to its use, says Russell, are at first obstinate costiveness, succeeded by diarrhœa and flatulence, with the loss of appetite and a sottish appearance The memories of those who take it soon fail, they become prematurely old, and then sink into the grave, objects of scorn and pity Mustapha Shatoor, an opium eater in Smyrna, took daily three drachms of crude opium The visible effects at the time, were the sparkling of his eyes, and great exhilaration of spirits He found the desire of increasing his dose growing upon him He seemed twenty years older than he really was, his complexion was very sallow, his legs small, his gums eaten away, and the teeth laid bare to the sockets He could not rise without first swallowing half a drachm of opium (*Phil Trans* xix 289)

When opium has been taken in an overdose, the first thing to be done for counteracting its bad effect, is the exhibition of a powerful emetic, and for this purpose sulphate of zinc, or sulphate of copper dissolved in water, should be immediately swallowed, and the vomiting kept up for a considerable time, and urged by irritation of the fauces Large draughts of vinegar and water, or other acidulated fluids, should afterwards be frequently taken, and the powers of the habit supported by brandy, coffee, and cordials The sufferer should be kept awake, and, if possible, in continued gentle motion Currie recommends the affusion of warm water at 106 degrees or 108 degrees for removing the drowsiness (*London Dispensatory*, 426)

Medical men have of late sought to discover the sedative principle of opium, and have found it in the extractive, from which a crystallized salt called morphia is obtained Some foreign physicians, and Mr

and Miscellaneous Particulars

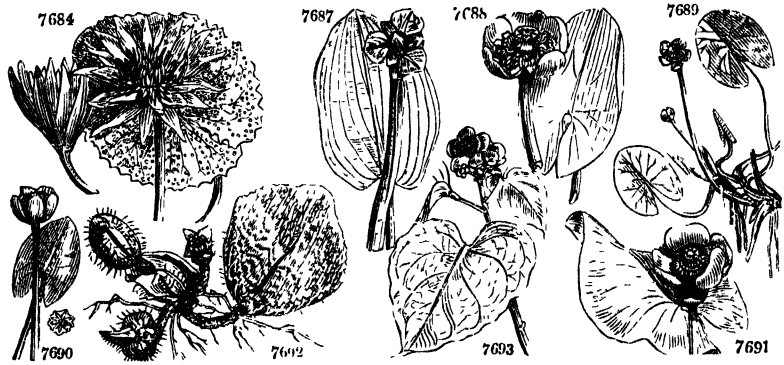
Thomson, the author of The London Dispensatory, have found that a quarter of a grain of the acetate of morphia produces the most beneficial effects that can be expected from an anodyne, allaying pain, and procuring sleep without in any degree affecting the central functions (*London Dispensatory*, 420)

A variety of P somniferum, known as the black poppy, from the color of its seeds, is cultivated for these to some extent, they are called maw seed, and generally stained of a light blue color

P Rhœas (*œillette*, Fr) and also somniferum are cultivated in Flanders and Germany for their seeds, which are bruised for an oil used in cookery as a substitute for that of olives In Poland and some parts of Russia, the seeds are used as a seasoning to soups, gruels, and porridge

Professor Martyn, in his edition of Miller's Dictionary, has collected a body of facts, which clearly prove that opium may be produced to any extent in Britain, and of equal quality to that procured from abroad, the value of labor in this country, however, does not admit of such a thing We have seen samples of opium made in the south of England quite equal to that of foreign growth, but we understood that the labor of collecting it was greater than could be afforded for its market price

P cambricum is admired for its yellow petals, and orientale and bracteatum are very splendid plants



1171 *Meconopsis* From μηκων, a poppy, and οψις, resemblance A genus of herbaceous shade-loving plants, just intermediate between Papaver and Argemone The flowers are yellow

1172 *Argemone* From *argema*, the name by which the cataract of the eye was known, and which was thought to be cured by this plant A mexicana is a troublesome weed in the West Indies, with a fig-like fruit, armed with prickles, and thence, by the Spaniards, called *Figo del infierno* The whole plant abounds with a milky glutinous juice, which turns in the air to a fine bright yellow, and when reduced to consistence is not distinguishable from gamboge In very small doses it is probably of equal efficacy, given in dropsies, jaundice, and cutaneous eruptions It is esteemed very detersive, and generally used in diseases of the eyes but the infusion is looked upon as a sudorific and resolutive, which may be used with success on many occasions The seeds are said to be a much stronger narcotic than opium

1173 *Sarracenia* So named by Tournefort in honor of Dr Sarrazin, a French physician of rank residing in Quebec, who sent this genus to him from Canada it is called side-saddle flower from the resemblance of the stigma to a woman's pillion These plants are remarkable for the singular form of the leaves, which are tubular and hold water, and some species have lids or covers, which it is alleged shrink and close over the mouth of the tribe in dry weather, so as to prevent the exhalation of the water In great drought birds and and other animals resort to them They grow in bogs in Carolina and Virginia, and in British gardens thrive very well in pots with turfy peat at the bottom, and the upper part filled with sphagnum, or water-moss, in which the plants must be set, and then placed in pans of water, they succeed best in frames in a shady situation (*Bot Cult* 417)

1174 *Nymphæa* The *Nymph*, or Naiad of the streams The species are beautiful aquatics, especially N alba, which has a large flower filled with petals, so as almost to appear double it raises itself out of the water and expands about seven o'clock in the morning, and closes again, reposing upon the surface, about

History, Use, Propagation, Culture,

four in the afternoon The roots have an astringent bitter taste, they are used in Ireland, in the Highlands of Scotland, in the island of Jura, &c to dye a dark brown or chesnut color Swine are said to eat it, goats not to be fond of it, kine and horses to refuse it The flowers, the herb, and the root were formerly used in medicine, but are all now obsolete

N lotus resembles our common white species very much in the form of the flower and leaves, but the latter are toothed about the edge It is native of the hot parts of the East Indies, Africa, and America It is very common in ponds, lakes, and rivers in Jamaica, and grows in vast quantities in the plains of Lower Egypt near Cairo, during the time they are under water It flowers there about the middle of September, and ripens towards the end of October The Arabians call it Nuphar The ancient Egyptians made a bread of the seed of the Lotus dried and ground

All the species grow well in large pots of water with a few inches of rich soil at the bottom they are propagated by dividing the root, and some sorts which produce bulbs are increased by offsets from these Mr Kent, of Clapton, who cultivated exotic aquatics to great perfection, found that the bulbous rooted Nymphæas, if checked in their growth for want of water, from cold, or excessive heat, were apt to form bulbs at the roots and cease growing for the season Hence the necessity of a regular and powerful moist heat to make them flower freely

1175 *Limnocharis* From λιμνος, a marsh, and χαρις, dear, so called because the species are marsh plants They have beautiful umbels of yellow flowers, and are very easily cultivated in a stove They are increased by seeds

1176. *Nuphar* The Arabic name is *naûfar*, according to Forskahl The species are shewy plants closely resembling Nymphæa. N lutea is a native of most parts of Europe, and also of America Linnæus states, that swine are fond both of the leaves and root, that goats are not fond of it, and that kine, sheep, and horses refuse it. also that crickets are driven out of houses by the smoke in burning it, and that both they and cock-roaches are destroyed by the roots rubbed or bruised with milk. Ray observes, that the flowers smell like brandy.

1177. *Euryale* From ευρυαλος, broad, in allusion to the enormous broad floating leaves of the plant. A noble aquatic, easily cultivated in a good stove

1178 *Bixa.* The American name of the tree The drug called Terra Orellana, or Orleana, Roucon or Arnotto, is prepared from the red pulp which covers the seeds of this plant By maceration in hot water, the seeds are separated from the pulp, the latter is then made into balls or cakes, which when dry are fit for use Arnotto of a good quality is of the color of fire, bright within, soft to the touch, and dissolves entirely in water. It is reputed to be cooling and cordial, and is much used by the Spaniards in their chocolate and soups, both to heighten the flavor and to give them an agreeable color. It is esteemed good in bloody fluxes

7684 Leaves peltate at the edge and within the fissure sinuate toothed blistered smooth on each side [end
7685 Leaves peltate nearly entire not dotted smooth on each side 2-lobed at base, Anthers with appendages at
7686 Leaves cordate entire, Lobes divaricating acute, Calyx acute 4-leaved longer than the acute petals

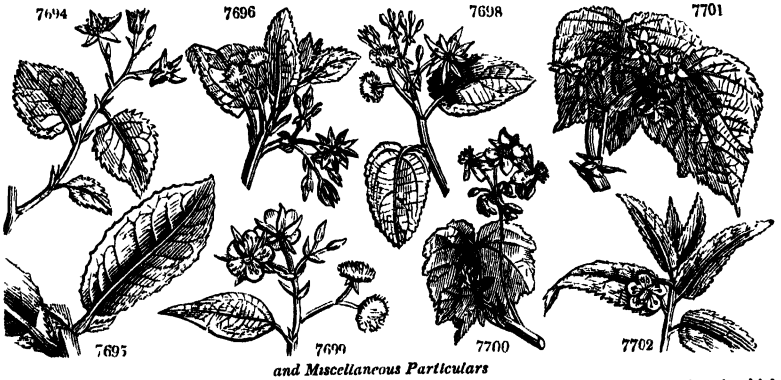
7687 Leaves oblong very blunt at each end, Flowers in umbels

7688 Leaves cordate entire, Lobes approximating, Cal. 5-leaved longer than petals
7689 Sepals 5, Stigma cut with 8-10 rays, Leaves cordate a little out of the water, Petioles roundish
7690 Sepals 5, Stigma lobed with 10 rays, Lvs obl cord dott. sub-pubesc. Petioles at base ½ round, at end nearly
7691 Leaves cordate entire half erect, Lobes divaricating, Cal 6-leaved longer than petals [3-cornered

7692 Petioles and calyxes covered over with stiff prickles, Leaves sometimes 3 feet across

7693 Leaves smooth on each side

7694 Leaves cordate ovate toothed, Peduncles terminal racemose



7695 Leaves ovate, Stipules cordate triangular serrated

7696 Leaves cordate lanceol serrate hirsute beneath, Capsules bristly
7697 Leaves obl subcordate serrulate hoary beneath, Caps bristly
7698 Leaves obl subcordate entire pubescent beneath, Caps muricated
7699 Leaves obl obovate acuminate entire smooth, Petals obtuse, Caps scabrous

7700 The only species

7701 The only species

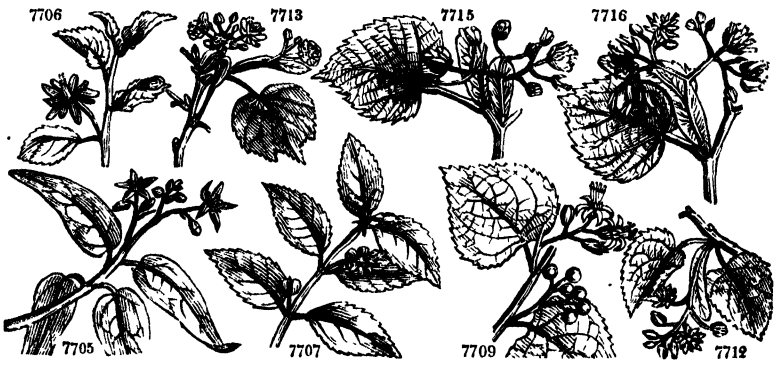
7702 Leaves serrated oblong oblique

and Miscellaneous Particulars

and disorders of the kidnies Mixed with lemon-juice and a gum, it makes the crimson paint with which the Indians adorn their persons It was formerly used by dyers to form the color called aurora, but at present it is not held in much estimation as a dye, though it still maintains its ground with painters Arnotto is well known to be the drug which is used for dying cheese in Gloucestershire, under the name of cheese-coloring It is used in Holland for coloring their butter The bark makes good ropes for the common plantation uses in the West Indies; and pieces of the wood are used by the Indians to procure fire by friction.

1179 *Prockia.* A name of unknown meaning. American or Isle of France plants with alternate entire or toothed leaves, and yellow flowers, which are occasionally unisexual

1180 *Sloanea* Named by Plumier, in memory of the famous Sir Hans Sloane, Bart, physician to the king, and president to the Royal Society, author of the Natural History of Jamaica, and founder of Chelsea garden and hospital. *The leaves are like those of the chesnut, the flowers very large, and the fruit as big as* a tennis ball, armed all over with strong spines, and divided regularly into four cells, each containing one small chesnut. It grows freely in our stoves, and ripened cuttings root in sand under a hand-glass



1181 *Apeiba.* The vernacular name of the plant in Guiana Tibourbou and Petoumo are vernacular names among the Caribs The species grow freely in light loamy soil Cuttings must be well ripened, and the glass they are put under should have a little air given it occasionally, or they will damp off The best way of flowering it, is to cut a ring round the bark of a large branch, which stagnates it and throws it into flower. (*Bot Cult* 20)

1182 *Sparmannia.* In memory of Anders or Andrew Sparrman, a Swede, fellow of the Academy of Sciences at Stockholm, who travelled into China, the Cape of Good Hope, and the islands of the South Sea His travels were published in London, 1785, quarto, and there are many descriptions by him in the Philosophical and other transactions. It is a beautiful shrub with snowy white petals, and singular nectaries It grows freely in loam and peat, and cuttings root in sand under a hand-glass

1183 *Entelea.* From ἐντελὴς, perfect So named by Mr. Brown, because all its filaments are fertile, by which character, among others, it is distinguished from Sparmannia A fine New Zealand plant, discovered originally by the botanists with Sir Joseph Banks in Cook's second voyage

1184 *Muntingia* Named by Plumier, after Abraham Munting, professor of botany at Groeningen, died in 1682 *Calabura* is an American name The flowers resemble those of the bramble, and the fruit cherries It grows in Jamaica on calcareous subalpine hills, flowering in spring, and in St. Domingo in the wet parts of woods, flowering in August and September. In our stoves it grows freely in light loam and cuttings root in sand under a hand-glass.

History, Use, Propagation, Culture,

1185 *Grewia* So named by Linnæus, in honor of Nehemiah Grew, M D, F R S, famous for his work on the Anatomy of Vegetables The species are shrubs with elm-looking leaves, generally deciduous, and of no great beauty Cuttings root in sand under a hand-glass in heat Some of the kinds produce a sort of berry which is esteemed by the natives of the country where they grow

1186 *Tilia* A name the meaning of which is unexplained *Tilleul*, Fr, *Linden*, Ger, and *Tiglio*, Ital The species are graceful trees with highly odoriferous flowers, all the soft parts abounding in mucilage

T intermedia is wild in Sweden, and will in some degree bear the smoke of London It is a favorite avenue tree in Holland and Germany, and at Evelyn's suggestions (Sylva) was a good deal employed in this way in England He describes some enormous lime trees in Switzerland, Germany, and Hungary, and speaks of its esteem in these countries, and by the Romans "It is a shameful negligence," he says, "that we are no better provided of nurseries, for a tree so choice and universally acceptable" for in his time they sent into Holland and Flanders, to our excessive cost, whilst our own woods spontaneously produce them, and though of somewhat a smaller leaf, yet altogether as good, apt to be civilized, and made more florid

Lime-tree wood is turned into light bowls and dishes, and into boxes for the apothecaries With the twigs they make baskets and cradles Formerly the bark was used for writing tablets Shoemakers make dressers of the plank to cut leather on The truncheons make a far better coal for gunpowder than that of alder itself, and also scribiets for painters' first draughts The wood is soft, light, and smooth, close grained, and not subject to the worm The most elegant use to which it is applied is for carving. Many of Gibbon's beautiful works in lime-tree are dispersed about the kingdom in our churches and palaces, as in the choir of St. Paul's, the Duke of Devonshire's at Chatsworth, Trinity College Library at Cambridge, &c Evelyn first recommended him to King Charles II The sap inspissated affords a quantity of sugar Boutcher remarks, that the timber is stronger and lighter than any sort of willow, and makes a proper lining for rooms, and when painted will last long

In Lincolnshire, in the forest of Dean, and in various parts of the borders of South Wales they make ropes of the bark. This, by maceration, separates into thin rough layers, and is used for making the mats used by gardeners, and called in the north of Europe bast They form a considerable part of the exports from Russia This quality in the bark, and a great degree of viscidity in the whole tree, evince its acknowledged affinity to the mallow tribe

7703 Leaves lanc. ovate soft, Cal very hairy, Pedunc. 3-flowered
7704 Leaves cordate ovate oblong crenated scabrous, Pedic. axillary 3-flowered, Fruit of 4 pieces
7705 Leaves ovate obl. acum. smooth nearly entire, Fl. terminal panicled
7706 Leaves roundish ovate blunt toothed smooth, Peduncles solitary 1-flowered
7707 Leaves ovate crenate rough on each side, Peduncles axillary 3-flowered
7708 Leaves ovate crenate rough thickish, Pedunc 2-6-fl. axill. and term Fruit pilose
7709 Leaves cordate roundish hoary beneath, Peduncles axillary about 4, longer than petiole
7710 Leaves cordate roundish smooth on each side, Peduncles shorter than petiole

* *Petals naked*

7711 Lvs. cord. uneq at base, Petioles and suckers hairy, Axill of veins beneath beard. Fruit globose smooth
7712 Lvs. cord. acum. ser smth twice as long as stalks, Axill of veins beard. ben Fr membr obl deform 2 seed
7713 Lvs. cord round acum finely serr. smth scarcely longer than stks Ax of veins ben beard Fr round very
7714 Lvs. cord. round acum. finely serr a little downy ben Fr. turb. woody with prominent ribs [thin & brittle

** *Petals with a scale at base*

7715 Lvs. deeply cord. abruptly acum finely serrated coriaceous smooth, Pet trunc. at end cren. Fruit ov ribbed

7716 Lvs trunc at base subcord. oblique dent. serr. pubescent beneath, Pet emarginate, Fruit globose smooth
β Leaves thin deeply and rarely cut
7717 Lvs. cord. subacum. unequal at base serrated snow-white beneath smooth above, Fruit round with 5 ribs

7718 Lvs. ov downy beneath, at base either cordate or obliquely or equally truncate, Fruit round with 5 ribs

7719 Caps. obl. ventricose, Lowest serratures of leaves setaceous
7720 Caps. 3-celled 3-valved 3-cornered, Angles bifid scabrous, Leaves obl Lowest serratures setaceous
7721 Caps obl. 3-celled 3-valved 6-furrowed 6-pointed, Leaves cordate, Lowest serratures setaceous
7722 Caps. prismatical cuneate acutangular 3-toothed, Lvs ovate with about 1 seta at the base, Petioles hispid
7723 Caps. roundish depressed rugose, Lowest serratures of leaves setaceous
7724 Caps roundish woolly, Leaves ovate obtuse downy equally serrated
7725 Caps. linear compressed 2-valved, Leaves lanceolate equally serrate

7726 Leaves 3 feet long obovate, Flowers growing out of the stem and old branches

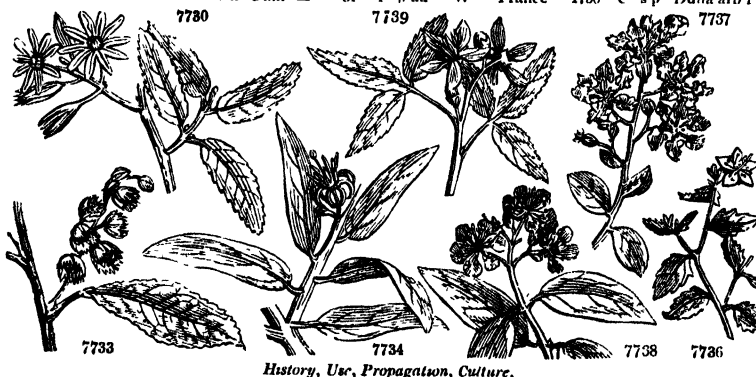
7727 Leaves oval
7728 Leaves ovate obtuse

7729 Leaves very blunt striated, Peduncles short, Berries 4-seeded

and Miscellaneous Particulars.

The honey made from the flowers of the lime tree is reckoned the finest in the world Near Kowno in Lithuania, there are large forests chiefly of this tree, and probably a distinct variety or species The honey produced in those forests sells at more than double the price of any other, and is used exclusively in medicine and for mixing with liqueurs. (*Encyc of Agric , Poland and Hungary*)

1187. *Corchorus.* Κορχορος, the Greek name of a culinary vegetable, supposed to be the same as that now known as C. olitorius *C* olitorius is sown in great plenty about Aleppo as a pot herb, the Jews boiling the leaves to eat with their meat, whence in French it is called *Mauve-de-Juif* The other species are weeds.



1188. *Grias* From γραω, to eat The fruit is eaten in the West Indies under the name of the Anchovy pear The uprightness of the growth and the largeness of the leaves give this tree a very elegant appearance The fruit is about the size of an alligator's egg, and much like it in shape, only a little more acute at one end, and of a brown russet color It is frequent in many parts of Jamaica, and grows generally in low moist bottoms or shallow water, where the fruit is pickled and eaten in the same manner with the East Indian mango, which it exactly resembles in taste It grows in a loamy soil, and large cuttings, Sweet observes, succeed best in the same soil under a hand-glass in heat

1189 *Calophyllum* From καλος, beautiful, and φυλλον, a leaf, on account of its large beautifully veined leaves C. Inophyllum (ις ινος, fibre, because the middle nerve of the leaf seems to ramify into a multitude of fibres) is a very large tree, with leaves like a water lilly, snow-white fragrant flowers, and fruit like a walnut. The trunk when wounded exudes a viscid yellowish juice, frequently hardening to a gum It is common in Malabar, in sandy soils, and bears fruit twice a year, in March and September, frequently to the age of three hundred years An oil is expressed from the nuts to burn in lamps, to assuage pains, and to make ointments The bark and gum is also used for medical purposes In Java, &c they plant this tree about their houses, for the elegance of the shade and the sweetness of the flowers.

C. Calaba (the name among the Caribs) branches from the ground upwards, and is therefore well adapted for tree hedges It has a green fruit not unlike our cornelian cherry, which is eaten by the natives, and an oil is expressed from it for lamps. Both species grow freely in a light loamy soil, and ripe cuttings are readily struck in sand under a glass and plunged in heat (*Sweet*)

1190 *Mammea* An alteration of its American name, *Mamey* The name having some resemblance to the Latin word *mamma*, a teat, Linnæus attributed the derivation to that word, on account of the large fleshy pointed nature of its fruit. *Abricot-sauvage*, Fr A handsome tree with a spreading elegant head, like those

History, Use, Propagation, Culture,

of Magnolia grandiflora, and odoriferous white flowers on peduncles The fruit is roundish, with a leathery rind, inclosing one thinner, containing a firm bright yellow pulp, having a pleasant singular taste, and a sweet aromatic smell, but the skin and seeds are very bitter and resinous. It is eaten raw alone, or cut in slices with wine or sugar, or preserved in sugar In Martinico they distil the flowers with spirit, and make a liquor which they call Eau créole

Some horticulturists are now attempting its culture in our stoves as a fruit tree It grows freely in sandy loam, and ripened cuttings, with the leaves not shortened, root in sand under a hand-glass in heat (*Sweet*)

1191 *Ochna* The Greek name of the wild pear tree, to which the genus so distinguished by Linnæus has no kind of resemblance The species are pretty free-flowering plants, with shining serrated leaves, and long racemes of beautiful yellow flowers. They grow freely in loam and peat, and cuttings root readily in sand under a hand-glass

1192 *Elæocarpus* From ἐλαία, the olive, and καρπος, fruit, in allusion to the shape of its fruit The stones cleaned from the pulp, and set in gold, are formed into necklaces The species thrive in loam and peat, and cuttings root in sand under a hand-glass

1193 *Alangium* So denominated by Lamarck, from a slight alteration of one of its Malabar names, *Alangi*. It grows in light sandy soil, and cuttings root in sand under a hand-glass in moist heat. (*Sweet*)

1194 *Mentzelia* Named after Christian Mentzel, a Prussian, physician to the Elector of Brandenburg, he died in 1701 Curious plants related to Loasa

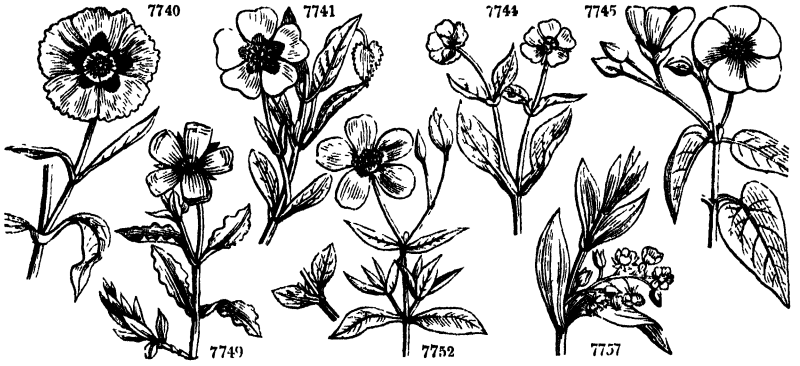
1195 *Lagerstræmia* So named by Linnæus from Magnus Lagerstroem, of Gottenburgh, director of the Swedish East India Company, who procured many curiosities from China, and gave them to the public L reginæ is a very handsome shrub the flowers are in panicles, a span long, pale rose-colored in the morning, growing deeper through the day, and becoming purple in the evening According to Sweet, this species is rather difficult to preserve through the winter, it requires a good heat, and but little water in winter, if it happens to have too much wet, it is a great chance if it survives · in summer it grows very fast, and requires plenty of room and water Cuttings of both kinds root readily in sand, under a hand-glass (*Bot. Cult.* 73.)

1196. *Ægle.* Αιγλη was one of the Hesperides. Correa de Serra named the genus *Ægle* from the fruit having some resemblance to the orange Sweet observes, that this plant likes a rich loamy soil The wood

7730 Stigma capitate, Petals 8-10, Leaves obovate very blunt serrated
7731 Flowers solitary, Leaves ovate acutely toothed, Sepals ovate

7732 Leaves lanceolate ellipt serrated, Racemes axillary
7733 Leaves obl. lanc. serrated netted, Racemes axillary clustered, Drupes blue

7734 Petals 10, Branches spiny



7735 Stem branched, Peduncles axillary, Petals crenate obtuse
7736 Stem branched, Peduncles axillary solitary, Petals acuminate, Fruit reflexed

7737 Petals crisp, Panicle terminal, Leaves roundish ovate acute smooth
7738 Petals wavy, Panicle terminal, Leaves oblong smooth

7739 Middle leaflet stalked, Fruit with 12 cells

7740 Leaves subsessile connate at base lin lanc smooth above downy beneath, Caps. 10-celled

7741 Leaves lin lanc sessile 3-nerved villous on each side, Pedunc cymose 1-sided
7742 Leaves on short stalks ovate lanceolate acum wavy at edge the upper hairy, Cymes hirsute
7743 Lvs sessile obl obt hirsute, Pedunc short 1-fl. or cymose, Caps small in a large hairy pyramidal calyx
7744 Leaves roundish ovate rugose tomentose hairy stalked, Pedunc 1-fl 1-3 together, Calyx villous
7745 Leaves stalked cordate acuminate smooth, Fl cymose, Pedunc. with long bractes
7746 Leaves stalked cordate ovate acuminate fringed at edge rugose and a little glutinous on each side
7747 Leaves sessile linear oblong acute wavy at edge 3-nerved at base, Sepals villous with long points
7748 Lvs lanc acute 3-nerv. hairy reticul beneath stalked, Stalks sheathing the stem with their connate bases
7749 Leaves sessile linear lanceolate waved crisp 3 nerved rugose pubescent, Fl sessile umbelled
7750 Leaves stalked ovate blunt rugose downy beneath, Pedunc long hoary 1-flowered
7751 Leaves stalked ovate lanc 3-nerved smooth above downy beneath, Petioles dilated and united at base
7752 Lvs ovate lanc on short stalks sheathing at base revolute at edge, Pedunc hirsute leafy 1-flowered
7753 Leaves spatulate toment rugose 3-nerved sessile subconnate the upper narrower, Pedunc 1-flowered
7754 Leaves obl lanc acuminate at each end rugose, Stalks short hairy sheathing, Pedunc short 1-2-3
7755 Leaves spatulate ovate downy hairy narrowed into a short stalk wavy at edge, Pedunc short 1-flowered
7756 Leaves sessile obl ellipt hoary downy about 3-nerved, Fl 3-8 in terminal umbels, Outer sepals largest
7757 Lvs conn obl lanc nerv above smooth and shin beneath silky, Fl in corymb. cymes, Ped and cal vill

and Miscellaneous Particulars

requires to be ripened before the cuttings are taken off, then to be planted in a pot of sand without shortening the leaves, and to be plunged under a hand-glass in heat.

1197 *Cistus* Κιστος, in Greek, derived from κιστη, a box, or capsule The capsules of the genus are remarkable All these words have been formed from the Anglo Saxon, *cyst*, which signifies a hollow vessel.

The species are for the most part shewy and free-flowering plants, the colors brilliant, and the petals very fugacious In gardens they are rather difficult to keep in a neat shape, getting naked below, and often dying wholly or in part during severe winters They succeed best in glass cases, which can be entirely removed in summer, or in a dry soil under a warm wall

C villosus has a strong woody stem, the flowers are produced at the ends of the branches, four or five together, almost in form of an umbel, but it rarely happens that more than one is open at the same time The petals are large, purple, and spread open like a rose, they are but of short duration, generally falling off the same day they expand; but there is a succession of fresh flowers every day for a considerable time in May and June, generally again in September and October, if the autumn be favorable, and even in the winter if the plants be protected from frosts

C ledon and ladaniferus produce the gum ladanum, but not in such quantities as C. creticus. The resin, which is secreted from the leaves and other parts of the shrub, is scraped off by means of a kind of rake, to which numerous leathern thongs are appended instead of teeth This instrument being drawn backwards and forwards over the plant from time to time, collects the resin The chief use of this gum in modern practice is in fumigations, its fragrant smell having made it a constant ingredient in such preparations C ladaniferus is the most popular species for warm situations in ornamental scenery

"Most of the species," Sweet observes, "will survive through the winter in the open air, if the weather be not too severe, but it is safest to keep some of all the kinds in pots, that they may be sheltered from severe frosts; and they can be turned out in the borders in spring, when they will thrive and flower well They will succeed in any common soil, or a mixture of loam and peat will suit them very well They may be increased by layers, or young cuttings, as soon as ripened, taken off at a joint, and planted under a hand-glass, will root readily: they may be also raised from seeds, which are produced in abundance" (*Bot Cult* 168.)

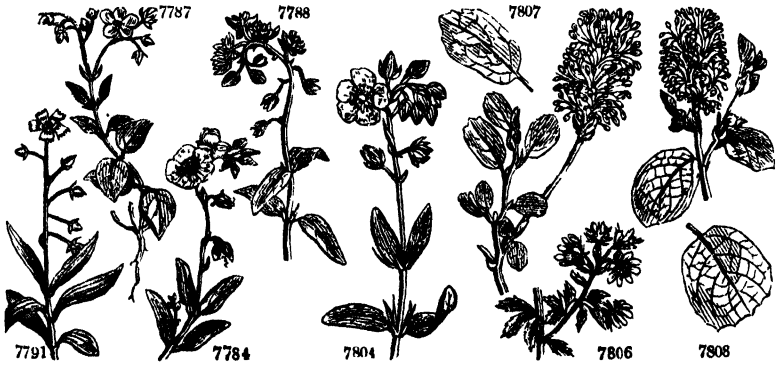
History, Use, Propagation, Culture,

1198. *Helianthemum* From ἥλιος, the sun, and ἄνθος, flower, in allusion to the bright golden radiance of the blossoms. This is a shewy free-flowering genus of little trailing plants, mostly ligneous, and well adapted for rock-work. A number of them answer best kept in pots, and sheltered by frames during winter, but some are quite hardy, and none are more ornamental than the H vulgare, and its varieties with orange, yellow, straw-colored, red, and double flowers It is one of the handsomest plants in cultivation for rock-work. All the species are of easy culture in light soil, and cuttings root freely under a hand-glass

1199. *Bauera.* Named after Francis and Ferdinand Bauer, German botanical draughtsmen of the highest



7758 Stem nearly smooth, Lvs. sess. lin. revol. at edge brownish green above hoary beneath, Fl sol. Sep shining
7759 Young shoots visc with downy hairs, Lvs. sess. lin obl viscid downy beneath, Fl in term umb. Sep. villous
7760 Branches hairy rough hoary, Lvs. sess atten at base green above ash-colored beneath, Ped. shorter than
7761 Leaves sessile hoary ovate-lanc. Pedunc panic hairy, Sepals 3 acute hairy [leaves, Cal hairy
7762 Branches villous, Leaves obov. lanc hoary, Pedunc. and cal villous, Sepals 3
7763 Branches white with scales, Leaves broad ovate blunt wavy at base silvery on each side, Cal hairy
7764 Branches white with scales upwards, Lvs. stalked ovate-obl Pedunc long bracted panicl Sepals 5 scaly
7765 Branches hairy, Lvs obl lanc acute hairy pale beneath, Pedunc. hairy 1-fl Capsule shorter than calyx
7766 Stems nearly simple, Radical leaves stalked ov obl 3-nerved hairy, Ped panic few, Cal smooth shining
7767 Stem hairy, Leaves sess. obl. lin 3-nerved villous, Racemes lax without bractes, Ped filiform naked
7768 Stem nearly smooth, Lvs obl ellipt. toothl Fl opp with stipules, Ped. erect smooth shorter than calyx
7769 Lvs. on short stalks lin obl. narr rev at edge, Stip lin subulate, Pedunc thif pubescent, Calyx inflated
7770 Branches hairy, Leaves obov. obl. acute toothletted, Stip lin obl Pedunc and cal hairy
7771 Leaves obl 3-5-nerved rough with short stellate hairs, Racemes long pubescent cinereous few-flowered
7772 Branches hoary, Leaves stalked opp. and alternate blunt glauc Stipules subulate, Raceme term erect
7773 Stem tortuose, Leaves altern lin rough at edge subinvolute, Pedunc sol 1-fl Caps naked
7774 Leaves setaceous glaucous nearly smooth, Stip filiform long, Pedunc racemose, Calyx hairy
7775 Branches villous, Leaves lin. obl. pubesc Stip lin subul mucron erect, Pedunc racemose glutinous
7776 Branches villous glutinous, Leaves lin vill glut ash-colored, Stipules long lax, Pedunc. and cal villous
7777 Leaves stalked ovate hairy on each side, Racemes short term Pet. scarcely larger than calyx
7778 Leaves lanc. ellipt. blunt green on each side, Racemes simple few-fl Cal subglobose ovate
7779 Branches simple long, Leaves pilose hispid lower ovate, upper lanc Racemes simple hairy hoary
7780 Leaves oblong hairy green above hoary beneath, Racemes simple, Pedic and cal hoary
7781 Leaves without stipules stalked ovate cordate, Racemes simple solitary few-flowered terminal
7782 Branches silvery with scales, Leaves stalked obl blunt silvery with small stipules, Cal. scaly
7783 Branches ascend hoary, Leaves downy glaucous the lower round, upper ellipt. Stip and bractes green
7784 Leaves lanc ovate hoary beneath green above, Calyx furrowed with elevated hairy nerves
7785 Leaves obl ellipt. hoary beneath deep green shining above, Calyx hoary its nerves with a few hairs
7786 Leaves scarcely revol. at edge hoary beneath, green and hairy above: lower round, upper obl Rac lax

7787 Lower leaves round: upper obl lin hairy green beneath, Racemes and calyxes hairy
7788 Leaves obov obl somewhat hairy, Racemes few-fl term Pet narrow lanceolate
7789 Leaves ovate-obl. keeled sessile, Peduncles long branched panicled, Stipules O
7790 Stipules O, Leaves lanc hoary hairy beneath, Pedunc long 2-leaved and racemose, Calyxes hairy
7791 Leaves opp lanc 3-nerved hairy viscid, Radical obovate, Racemes without bractes, Petals serrated
7792 Leaves obovate obl revolute at edge downy hairy hoary beneath, Calxes very hirsute white
7793 Leaves obl linear glaucous above hoary beneath, Cal. hoary minutely pubescent, Branches hoary
7794 Leaves lin obl revolute at edge hoary on each side, Calyxes very hirsute white
7795 Leaves lin very short pubescent opp Stip mucronate erect, Pedunc villous few-flowered
7796 Leaves oblong lin revolute at edge the younger hoary on each side, Calyxes glaucous, Sepals ciliated
7797 Leaves short stalked lin oblong hispid above, Racemes lax, Calyx with deciduous hairs
7798 Leaves flat ovate obl. acute smooth above beneath finely downy, Cal striated smoothish
7799 Leaves obl ovate obt. flat beneath hoary above smooth green, Cal striated smooth shining
7800 Leaves stalked obl lin downy beneath glaucous above, Cal shortly hairy striated glaucous obtuse
7801 Leaves linear hoary on each side setose at end, Stipules subulate, Cal hairy nerved striated
7802 Upper leaves flat obl hairy, Stipules ciliated longer than stalk, Fl large, Calyxes hairy
7803 Leaves ovate lanc a little downy on each side, Stipules linear, Ped and cal pilose hirsute
7804 Leaves downy hoary beneath glaucous above revolute at edge, Calyxes yellowish glaucous
7805 Leaves narrow lanc flat with stellate pubescence on each side, Raceme terminal few-flowered

DIGYNIA.

7806 The only species

7807 Leaves cuneate obovate upwards crenate toothed
7808 Leaves ovate-oblong cordate at base, upwards crenate toothed
7809 Leaves ovate acute nearly entire
7810 Leaves oblong acute crenate-toothed upwards, green beneath

and Miscellaneous Particulars.

celebrity. Nothing comparable to their works has ever appeared from any other hand. The species is a hardy free-flowering plant, of easy culture in sandy loam and peat, and cuttings root in the same soil under a glass.

1200 *Fothergilla.* In memory of John Fothergill, M D., an eminent physician and patron of botany, who cultivated a variety of the most curious plants in his garden near London The species are dwarf deciduous shrubs, of easy culture in light soil or peat, and generally increased by layers.

History, Use, Propagation, Culture,

1201. *Curatella.* From *curatus*, worked; a name given by Aublet to the genus, because the leaves, which have a rough surface, are used in Guyana for polishing bows, sabres, and other weapons. A small tree with rough leaves, which grows well in sandy loam, cuttings root in sand under a glass.

1202. *Pæonia.* The physician Pæon was the first to use this in medicine The Greek legend adds, that he used it to cure Pluto of a wound inflicted by Hercules The species are magnificent flowering plants, especially P officinalis and moutan, with their numerous varieties P moutan and its different varieties are hardy enough to bear our winters in the open air, but they do not flower in such perfection as when planted out in a conservatory, or in a pit where they may be protected from the severe frost under glass: they will thrive well in any rich light soil, and ripened cuttings, slipped off, and planted in the ground, in a shady place, without cover, will root freely. (*Bot Cult* 234)

P. edulis has a more slender stem than the common Pæony The Daurians and Mongols boil the root in

7811 Leaves ovate subrepand toothletted rough

7837 Leaves palmate many-parted, Lobes linear distant, Pedicels longer than bract, Pet shorter than calyx

and Miscellaneous Particulars

their broth, and grind the seeds and put them into their tea P officinalis was by old authors said to be of two sorts, male and female, the flowers of the former being smaller and lighter colored than those of the latter These distinctions, however, were not indicative of sexual difference, the peony being hermaphrodite, but merely of stronger and weaker growing varieties, according to the practice of the age Now they are laid aside, the varieties reduced to seven or eight, of which a full account is given in the Horticultural Transactions (vol. ii 273) Of these, the double red, the most common, when introduced at Antwerp about the end of the sixteenth century, sold for twelve crowns a root A useful account of the species and varieties has been published by Messrs Anderson and Sabine, in the transactions of the Linnean Society

1203 *Hibbertia.* Named after George Hibbert, Esq who was once a distinguished English collector of plants Twining or trailing plants of New Holland, with bright yellow flowers

1204 *Delphinium* From δελφιν, a dolphin, on account of the resemblance between the nectary of the

History, Use, Propagation, Culture,

plant and the imaginary figures of the dolphin The species are shewy annuals or perennials, valuable as border flowers The leaves are generally much divided, and the flowers in terminal spikes, blue, purple, or red, never yellow or any shade of that color

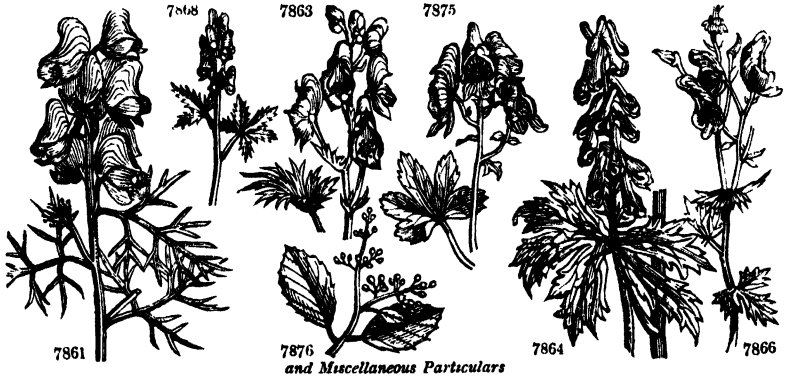
D. consolida, (from *consoludare*, to unite; it being formerly reputed as a most powerful vulnerary,) *Pied d'Alouette*, Fr., *Rittersporn*, Ger, is a shewy annual, with blue, pink, purple, and white flowers, and semi-double and double D Ajacis, so called because some traces may be perceived in the flower of what may be likened to the letters AIA, is by some considered as only a variety of this species · both are universally grown as border annuals D elatum is well adapted for shrubberies. All the species are of the easiest culture The species are extremely difficult to distinguish from each other, and are probably in many cases mere varieties.

1205. *Aconitum* So called from growing about Acona, a town of Bithynia. The species are robust free-flowering plants of some beauty and consequence The stems rise from two to six feet in height, upright, strong, furnished with many digitate or palmate leaves, and terminated by panicles or loose spikes of blue or yellow flowers.

A. Napellus, from *napus*, a turnip, its grumous roots resembling little turnips, is a well known poisonous plant. Linnæus says, that it is fatal to kine and goats, especially when they come fresh to it, and are not acquainted with the plant; but that it does no injury to horses, who eat it only when dry. He also relates (from the Stockholm Acts) that an ignorant surgeon prescribed the leaves, and on the patient refusing to take them, he took them himself and died. The ancients, who were acquainted with chemical poisons, regarded the Aconite as the most violent of all poisons Some persons, only by taking in the effluvia of the herb in full flower by the nostrils, have been seized with swooning fits, and have lost their sight for two or three days

7838 Stem erect branch. Lvs 5-part. Lobes obl acumin Pet. shorter than cal Caps. notted with color pubescent
7839 Petioles not dilat. at base, Lvs cord. 5-7-fid up 3-lobed, Lobes cut serr Fed bract cal. and ovaries smooth
7840 Petioles not dilated at base, Leaves downy 5-lobed, Lobes cuneate at base trifid cut, Spur inflexed

7841 Petioles not dilated at base, Lvs orbicular cord. 5-fid, Lobes cut acute deflexed, Bractes 3, Ovaries smooth
7842 Petioles sheathing at base, Lvs. many-part. with lin. lobes, Raceme close, Spur straight longer than flower



7843 Lvs somewhat dilated at base, Segm cuneiform serr cut in front, Stem upwards and peduncles pubescent
7844 Petioles not dilated at base, Lvs flat trifid beyond the middle, Lobes cuneiform trifid at the end acuminate
7845 Pet. scar dilat. at base, Lvs. 3-5-part multif. with lin lobes, Rac straight, Pet beard at end low. very vill
7846 Pet scar dilat at base, Lvs 3-7-lob Lobes obl ac cut pinnatifid up 3-part Caps nett at keel and edge cil
7847 Pet smth. but scar. sheath at base, Lvs 5-par Lobes 3-5-fid lin Pet. sh than cal Caps refl from their base
7848 Petioles not dilated at base, Leaves concave beyond the middle trifid, Lobes cuneiform cut acuminate at end
7849 Petio not dilat at base, Lvs 5-lob with cut lobes, Stem flexu. and petioles hairy, Bractes lin Caps smooth
7850 Petioles sheathing at base, Lvs many-par with lin subul segm Fl pubesc. Spur acute longer than flowers
7851 Pet not dilat at base, Lvs. 3-7-lob with obl ac cut pinnat lobes, Rac lax branch Bractes and ovaries pub
7852 Petioles sheathing at base, Lvs many-parted in lin lobes, Rac long, Spur straight blunt longer than pedicel
7853 Spur very short, Bracteoles inserted at base of pedicel, Petioles hairy, Pedicels twice as long as flower
7854 Spur scarcely shorter than cal Bracteoles inserted at base of pedicel, Petioles pubesc. Pedic. scarcely longer
7855 Spur nearly as long as calyx, Bractes inserted in the middle of pedicel, Petioles hairy [than flower

7856 Pan divaricating, Branches tortuose, Helmet conical half circular, Spur short thick spiral [at end
7857 Fl spiked or panic numerous, Lvs deeply 3-5-lobed with cuneate trifid lobes, Spur slender straight curv
7858 Helmet conical cylindric Spur slender spirally twisted, Lip divaricating, Lvs palm 3-5-lob beyond middle
7859 Veiny smooth, Pan. smoothish with ascend branches, Bag of hoods very large ventric Spur thick subinvol
7860 Pan divaricating very smooth, Branches tortuose, Spur thick somewhat spiral, Lobes of leaves rhomboid
7861 Fls panic Sep and pet persist Bag of hoods scarcely any, Spur thick spiral, Lvs multif with lin ac segm
7862 All over densely pubesc Lvs. very large palmate 3-5-lobed beyond middle pubesc. Helmet conical cylindr.
7863 Like Anthera, but flowers smoothish variegated with a low subconical helmet [compressed
7864 Like Lycoctonum, but flowers panicled, Stem peduncles and flowers villous, Ovaries smooth or hairy
7865 Ovaries 4-5, Helmet conical with a long claw, Rac. lax simple, Lvs. 3-5-parted with trifid toothed lobes
7866 Pan lax, Helmet conical elongated abruptly mucronate in front, Spur thick spiral, Ovaries 3-5

7867 Pan lax, Branches 1-4-fl Spur thick long abruptly kneed, Bags of hoods inflated, Ovaries 3-5 smooth
7868 Ovaries 3 smooth, Raceme lax corymbose, Ped smooth, Helmet very convex subconical
7869 Pan lax, Helmet exactly conical, Spur very thick blunt very short, Bag of the hoods very large
7870 Fl panic Helmet conical, Spur thick blunt very short. Lvs deeply lobed with narrow diverging segments
7871 Stem very short, Low lvs few on long stalks 5-part with palm segm. Hoods hook blunt, Ovaries 3 villous
7872 Ovaries 3 smooth, Raceme cylindric long, Leaves divided down to petiole with linear acute furrowed lobes
7873 Ovaries 3 smooth, Rac cylindr long very compact, Pedicels smooth shorter than bractes, Lvs subpedate
7874 Stem twining with spreading hairs, Petioles ciliated, Leaves 3-5-parted with pinnatifid lobes, Ovaries 5-7
7875 Pan. lax, Branches diverging, Helmet exactly conical, Leaves 3-lobed with entire lobes, Ovaries villous

PENTAGYNIA.

7876 Leaves very rough toothed

and Miscellaneous Particulars

But the root is unquestionably the most powerful part of the plant Matthiolus relates, that a criminal was put to death by taking one dram of it. Dodonæus gives us an instance, recent in his time, of five persons at Antwerp, who ate the root by mistake, and all died. Dr Turner also mentions, that some Frenchmen at the same place, eating the shoots of this plant for those of masterwort, all died in the course of two days, except two players, who quickly evacuated all that they had taken by vomit. We have an account, in the Philosophical Transactions, of a man who was poisoned, in the year 1732, by eating some of this plant in a salad, instead of celery. Dr Willis also, in his work De Anima Brutorum, gives an instance of a man who died in a few hours, by eating the tender leaves of this plant also in a salad He was seized with all the symptoms of mania The Aconite, thus invested with terrors, has, however, been so far subdued, as to become a powerful remedy in some of the most troublesome disorders incident to the human frame Baron Stoerck led the way by administering it in violent pains of the side and joints, in glandulous scirrhi, tumours, ulcerous tubercles of the breast, &c. to the quantity of from ten to thirty grains in a dose, of an extract, the method of making which he describes

Willdenow and the Dublin College consider that the plant used by Stoerck was the A neomontanum, in which opinion Mr Thomson agrees in his London Dispensatory

All the species are poisonous in a high degree. The limits of the species are extremely obscure, and in a very unsettled state, Decandolle in his Systema, increased the number at that time known, but in his Prodromus many of the species of the Systema are considered mere varieties. Dr. Reichenbach has, however, multiplied the species prodigiously, but with little reason.

1206 *Trachytella* From τραχυτης, roughness These are climbing shrubs with racemose white flowers, and hard rough leaves, which are used in China for polishing metals and hard wood

History, Use, Propagation, Culture,

1207 *Cimicifuga* From *cimex*, a bug, and *fugo*, to drive away, indicating certain virtues a species is supposed to possess The C serpentaria is used with success by the native practitioners in North America, for curing the dangerous bite of the rattlesnake. Tall, leafy herbaceous plants, with the appearance of Actæa.

1208 *Aquilegia* From *aquila*, an eagle; the inverted spurs of the flower have been likened to the talons of a bird of prey The species are smooth-leaved, handsome-flowered plants A vulgaris is an old inhabitant of the flower border the whole plant has been recommended to be used medicinally, but it belongs to a suspicious natural order, and Linnæus affirms, that children have lost their lives by it A alpina is the handsomest species

1209 *Nigella* From *niger*, black, because of the color of the seeds, which are the part of the plant known in cookery The species are curious or neat little plants, with fine cut leaves like fennel N. damascena and sativa are sown as hardy annual flowers, and on the continent, the leaves and seeds of the latter species and N arvensis, are used in cookery instead of more expensive aromatics. They are also said to be extensively used in the adulteration of pepper

1210. *Reaumuria* So named by Hasselquist, in honor of René A F de Reaumur, author of several entomological works, Histoire des Insectes, &c He died in 1757. A small cæsious plant, bearing an abundance of bright lilac flowers

1211 *Colbertia* Named by Mr Salisbury after the famous Colbert, a patron of the Paris garden, who destroyed with his own hands the vines which had been planted therein in lieu of more curious objects. A fine plant, with leaves like those of Dillenia speciosa

1212. *Tetracera* From τετρα, four, and κερας, a horn, because of its four capsules recurved like as many horns. Shrubs or small trees, which are often climbers with alternate stalked naked leaves, often rough above The flowers are panicled or racemose The leaves are remarkable as an exemplification of that mode of nervation which M. Decandolle calls feather-nerving

1213 *Nelumbium* This is called in Ceylon *Nelumbo* Sir James Smith proposed to call the genus by the more classical name of *Cyamus*, but it has been remarked, that it remains to be proved that the holy κυαμος, was this plant. N. speciosum is a native both of the East and West Indies, China, Cochin-China, and Japan,

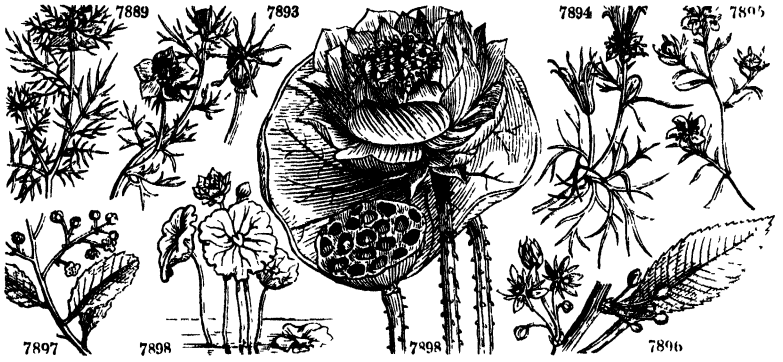
7877 Monogynous, Racemes very long, Caps. dry dehiscent, Leaves biternate with serrate or cut segments

7878 Ovaries 4 subsessile very vill. Racemes panicled, Lvs ternate or biternate, Segm ovate-lanc cut toothed
7879 Ovaries 2-3 smooth sessile, Racemes panicled, Leaves biternate, Segments cordate at base
7880 Ovaries 12-15 in a roundish head, Racemes dichotomous panicled, Leaves palmate

7881 Spurs incurved, Caps vill Stem few or 1-fl Lvs covered with viscid down, Styles not longer than stamens
7882 Spurs incurved, Caps villous, Stem leafy many-fl. Leaves nearly smooth, Styles not longer than stamens

7883 Spurs incurved twice as short as petals, Upper part of the plant and capsules covered with glandular hairs
7884 Spurs straight longer than limb, Stam as long as petals, Styles long, Petals oval obl shorter than petals
7885 Spurs straight longer than very blunt limb, Styles scarcely longer than stamens and petals, Sepals acute the length of petals
7886 Spurs straight somewhat incurved at end twice as short as limb of petals, Stem 2-3-fl leafy, Lvs finely cut
7887 Spurs straight, Styles and stamens exserted, Sepals acute a little longer than petals, Segm of leaves 3-parted
7888 Spurs straight as long as limb, Styles and stamens as long as sepals, Sepals the length of petals

7889 Anthers blunt, Caps 5 smooth 2-cell united as far as end into an ovate globose one, Fls in a leafy involucre
7890 Anthers blunt, Flowers in an involucre, Sepals erect conniving
7891 Anthers blunt, Caps muricate, Stem erect hairy, Flowers naked
7892 Anthers pointed, Styles 5-7 revolute, Capsules and stem smooth, Branches diverging
7893 Anthers pointed, Styles 8-10 erect Caps smooth 1-nerved at back, Stem erect smooth, Branches erect
7894 Caps 5-10 smooth erect, Styles straight



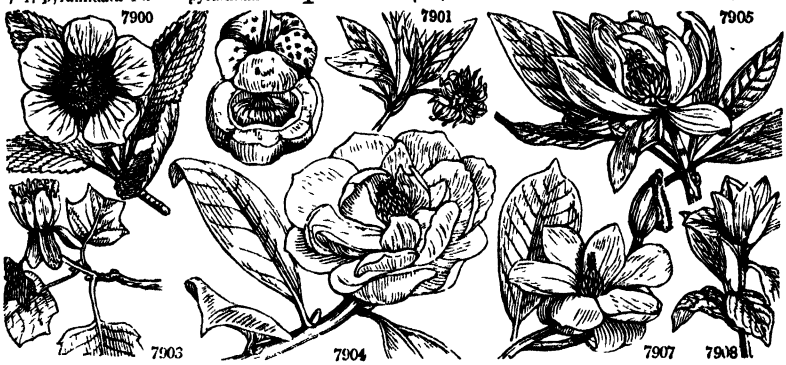
7895 A low shrub, with narrow glaucous leaves

7896 Leaves smooth 10-nerved 1-1½ foot long 6 inches broad

7897 Lvs. oval-obl. blunt or nearly acute smooth roughish above somewhat toothed at end, Pedunc panicled [pubescent

POLYGYNIA.

7898 Petals many, Anthers lengthened beyond the cells into a clavate appendage
β Inner petals scarcely smaller than the outer, blunt
7899 Petals many, Anthers lengthened beyond the cells into a linear appendage



and Miscellaneous Particulars

Persia, and some parts of the Russian empire. Thunberg informs us, that it is considered as a sacred plant in Japan, and pleasing to their deities, and that the images of their idols were often drawn sitting on its large leaves The long stalks are there eaten among other potherbs. Loureiro relates, that it abounds in muddy marshes in India and China, and is cultivated in large handsome pots in the gardens and houses of the mandarins; that there is a variety with the flower of a pure white, and another with a very beautiful luxuriant flower, having about one hundred large petals, white or rose-colored. Both root and seeds are esculent, sapid and wholesome In China it is called Lien wha, and the seeds and slices of the hairy root, with the kernels of apricots and walnuts, and alternate layers of ice, were frequently presented to the British ambassador and his suite at breakfasts given by some of the principal mandarins The Chinese have always held this plant in such high value, that at length they regarded it as sacred That character, however, has not limited it to merely ornamental purposes, for the roots are not only served up in summer with ice, but they are also laid up in salt and vinegar for the winter. The seeds are somewhat of the size and form of an acorn, and of a taste more delicate than that of almonds The ponds are generally covered with it, and exhibit a very beautiful appearance, when it is in flower, and the flowers are no less fragrant than handsome

Sir George Staunton remarks, that the leaf, besides its common uses, has, from its structure, growing entirely round the stalk, the advantage of defending the flower and fruit arising from its centre from contact with the water, which might injure them. He also remarks, that the stem never fails to ascend in the water from whatever depth, unless in case of a sudden inundation, until it attains the surface, when its leaf expands, rests, and swims upon it, and sometimes rises above it. This plant bears the rigorous cold of the Pekin winter, though it is reared with difficulty in European stoves It often grows spontaneously in China, and is propagated in the open air with ease both by the seed and root. The Chinese distinguish many varieties of it

From the root of the Nelumbo, Sir George Staunton says, the Egyptians are supposed to have prepared their Colocasia, but the plant is now no longer found in that country, from which circumstance some naturalists infer, that it never was indigenous there, but cultivated by the inhabitants with extreme care The ancient Romans made repeated efforts to raise it among them, from seeds brought out of Egypt and the

History, Use, Propagation, Culture,

modern attempts to cultivate it in Europe, though with the assistance of artificial heat, seldom have succeeded

Dr Patrick Browne is of opinion that the ancients confounded two plants under the name of Lotus or Egyptian bean, and that under these titles they described the upper parts of the Nymphæa Nelumbo, and the roots of the lesser Colocasia, now commonly called *coccos* in Jamaica, Arum Colocasia (*Jam.* 243. 332.)

In our stoves the Nelumbium should be grown in a tub or large pot, in a rich loamy soil, and requires a strong heat to flower in perfection The pot or tub should be kept full of water all the time the plants are growing, but may be allowed to get dry when the flowering season is over The plants may be increased by dividing at the root, but it is obtained more readily from seeds, which vegetate freely (*Bot Cult* 83)

Kent of Clapton says, that the seeds will keep forty years, vegetate freely, and flower the first year (*Hort Trans* iii 36)

1214 *Dillenia* So named by Linnæus, in honor of John James Dillenius, the famous professor of botany at Oxford, author of Historia Muscorum, Hortus Elthamensis, &c The species are beautiful trees, with large leathery leaves, and axillary or terminating flowers often also large They thrive best in a light loamy soil. Ripened cuttings, not deprived of their leaves, strike root freely, in a pot of sand plunged under a hand-glass in heat. *Good seeds sometimes arrive from India, when the sooner they are sown the better*; placed in a moderate hot-bed frame, they will succeed well (*Bot Cult* 50)

1215 *Illicium* From *illicio*, to attract, on account of its agreeable perfume I floridanum has very fragrant leaves, and capsules having a strong smell of anise when rubbed This species, and more especially anisatum is powerfully carminative and stomachic In China it is in frequent use for seasoning dishes, especially such as are sweet. In Japan they place bundles and garlands of the aniseed-tree in their temples before their idols, and on the tombs of their friends They also use the powdered bark as incense to their idols A branch put into the decoction of Tetraodon hispidum is supposed to increase the virulence of that poison The bark, finely powdered, is used by the public watchmen to make a chronometer or instrument for measuring the hours, by slowly sparkling at certain intervals in a box, in order to direct when the public bells are to sound.

Ripened cuttings will root in sand, but the plant is most readily increased by layers.

1216. *Liriodendron* From λειριον, a lily, and δενδρεον, a tree. The flowers, which may be likened to a lily or tulip, grow upon one of the loftiest trees of the forest. A smooth tree, not less admired for its fiddle-shaped leaves, than its tulip-like flowers, which are produced at the end of the branches, they are composed of six petals, three without and three within, which form a sort of bell-shaped flower, whence the inhabitants of North America gave it the title of tulip These petals are marked with green, yellow, and red spots, making a fine appearance when the trees are well charged with flowers. When the flowers drop the germ swells, and forms a kind of cone, but it does not ripen in England

The timber is used in America for canoes, but is unfit for boards or planks, as it contracts and expands more than the wood of any other tree

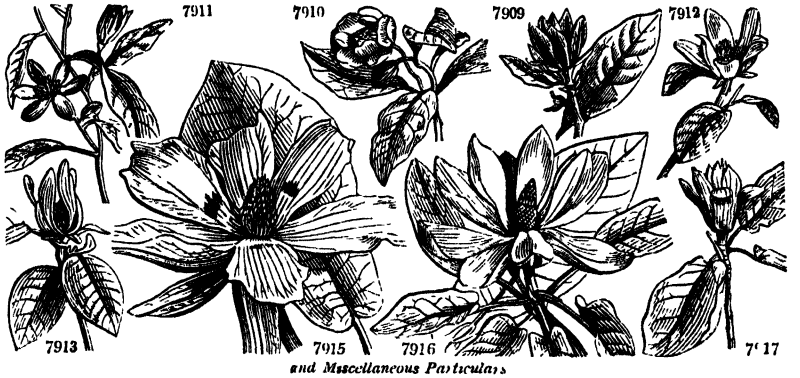
The tulip tree is now very common in Europe, in the south of France and Italy, it is frequent in public avenues, and flowers when twenty or thirty feet high, and of six or seven years growth. In Britain it requires a

7900 Leaves elliptic oblong simply serrated, Peduncles 1-flowered

7901 Petals 27-30 purple: outer oblong; inner lanceolate
7902 Petals 9-12 yellowish ovate roundish

7903 Leaves truncate at end with two broad opposite stipules

7904 Leaves evergreen oval-obl coriaceous shining above ferrugineous beneath, Flowers erect with 9-12 petals



7905 Leaves elliptical blunt glaucous beneath, Flowers with 9-12 contracted petals which are ovate concave
7906 Like the last, but leaves evergreen elliptical acute at each end
7907 Lvs. deciduous obovate abruptly acuminate the younger pubescent, Flowers naked erect with 6-9 petals

7908 Lvs deciduous obov acute netted nearly smooth, Fls erect, Sepals 3, Petals 6 obovate, Styles very short
7909 Lvs. decid. obov point. at each end, younger downy ben, old ones smooth, Fls erect, Sep 3, Pet 6, Styles [very short

7910 Leaves evergreen smooth netted ellipt acuminate at each end subglaucous, Flowers cernuous
7911 Leaves evergreen elliptic obl.: the old smooth, younger and branches fuscous downy, Flowers erect

7912 Lvs deciduous heart-shaped subovate acute, above smooth, beneath somewhat tomentose, Pet. 6-9 obl
7913 Leaves deciduous oval acuminate pubescent beneath, Petals 6-9
7914 Leaves deciduous lanc much spreading, younger downy beneath, Petals 9-12, the outer hanging down

7915 Lvs deciduous very large obl obov subcuneate cordate at base, beneath whitish glaucous, Pet 6-9 ovate
7916 Lvs decid smooth spatulate obov subcord at base, Auricles blunt close, Sep 3 much spread Pet 9 oblong
7917 Lvs decid smth spatul obov subcord at base, of same color on both sides, Auric spread Pet 9 lanc acum

and Miscellaneous Particulars

greater age, though ringing might probably be successfully applied to throwing this and other ornamental trees into a flowering state There are many fine old trees round London, in the parishes of Fulham, Walham-green, Kew, &c, and a very fine one even so far north as Pitcaithly wells in Fifeshire

1217. *Magnolia* In honor of Pierre Magnol, professor of medicine, and prefect of the botanic garden at Montpelier, author of Botanicum Monspeliense, 1676, and other works The species are chiefly large trees with large leaves, and axillary flowers, also very large and highly odorous

M grandiflora is the noblest species, the leaves, which are persistent, are nine or ten inches long, and not unlike those of a common laurel The flowers are produced at the ends of the branches they are very large, and composed of eight or ten petals, narrow at their base, but broad, rounded, and a little waved at their extremities, they spread open very wide, are of a pure white color, and have an agreeable scent

The variety *g* elliptica or Exmouth (having been raised from the seed of an old tree in Sir John Collington's garden of that place) flowers earliest and most freely it is also the hardiest

M glauca is deciduous In America it is known by the names of *white laurel, swamp sassafras*, and *beaver tree* It has the last name, because the root is eaten as a great dainty by beavers, and this animal is caught by means of it Kalm says, these trees may be discovered by the scent of the blossoms at the distance of three quarters of a mile, if the wind be favorable It is beyond description pleasant to travel in the woods at the flowering season, especially in the evening They retain their flowers for three weeks, and even longer The berries also look very handsome when they are ripe, being of a rich red color, and hanging in bunches on slender threads They cure coughs and other pectoral diseases by putting these berries into brandy, and giving a draught of the liquor every morning The wood is made use of for joiners' planes Dillenius remarks, that the flowers never open in a morning, that the calyx falls off at the second opening of the flower, but that the petals dry on, and that the scent resembles that of the lily of the valley, with a mixture of aromatic

M conspicua is much valued as a free flowerer, and on account of the early appearance of its white odoriferous blossoms. *Yulan* is the vernacular name in Japan

M. acuminata bears a fruit about three inches long, like a small cucumber, and is thence called cucumber tree in America

M tripetala has leaves twelve or fifteen inches long and five or six inches wide, narrowing to a point at each extremity, and placed at the ends of the branches in a circular manner like an umbrella, whence its name The flowers are composed of ten, eleven, or twelve large oblong white petals, the wood is soft and spongy, and the leaves drop off earlier than in the other deciduous sorts.

The different species, Sweet observes, are generally increased by layers or seeds: when the layers are first taken off they should be potted in a mixture of loam and peat, and placed in a close frame till they have taken fresh root None of the leaves should be taken off or shortened, nor any shoots be cut off, or their tops shortened, as they will not succeed so well, for the more branches and leaves are on them, the sooner they will strike fresh root. Most cultivators cut off many of the leaves and shoots of layers, when they are first taken off, thinking the roots will not have so much to nourish, which is the very reason

History, Use, Propagation, Culture,

they often lose great part of their crop, layers of any kind of shrub whatever, when first taken off, should not have a single leaf taken off till they have made fresh root · supposing their tops flag ever so much, as long as there is life it will draw up the sap, and help the plant to root afresh The Chinese kinds are often inarched or budded on M obovata, which takes readily (*Bot Cult* 306)

1218 *Michelia* Named by Linnæus, in honor of Pietro Antonio Micheli, of Florence, author of Nova Plantarum Genera, Flor 1729, fol A lofty tree, with fragrant flowers, and fruit edible, but not agreeable In our stoves it grows well in light loam, and cuttings root in sand under a glass and plunged in heat

1219 *Uvaria* The fruit grows in bunches like a small bunch of grapes, whence it has been called *Uvaria* from *Uva* The berries are considered a specific for gonorrhœa, and are used under the name of *cubebs* These are trees or shrubs with erect or trailing stems, and 1-4-flowered axillary peduncles

1220 *Anona* This is called by the Malays, *manoa*, and at Banda, *menona*, which it is presumed that the Europeans have corrupted into Anona As the word signifies in Latin food, it has been adopted by Linnæus in this sense, because of the habitual use made of the fruit by the Americans The species are for the most part fruit trees, with soft pulpy subacid berries, sometimes as large as an orange, but generally more like a plum

A muricata is common in every savannah of Jamaica, flowering in the spring. The large succulent fruit is agreeable to new-comers and over-heated habits, but it is so common, and so much in use among the negroes, that it is now hardly ever used among the better sort of people The smell and taste of the fruit, flowers, and whole plant, resemble very much those of black currants.

A tripetala is a large tree with large bright green leaves The fruit is oblong, scaly on the outside, and of a dark purple color when ripe, the flesh is soft and sweet, and has many brown seeds intermixed with it which are very smooth and shining It is esteemed by the Peruvians as one of their most delicate sorts.

A palustris grows wild in soft marshy places in Jamaica, and bears a fine sweet-scented fruit, of no disagreeable flavour; but it is said to be a strong narcotic, and is not eaten on that account. It is called alligator apple. The wood of this tree is so very soft, even after it is dried, that it is frequently used by the country people instead of corks, to stop up their jugs and calabashes; whence it has now universally obtained the name of cork-wood in Jamaica. (*Browne*)

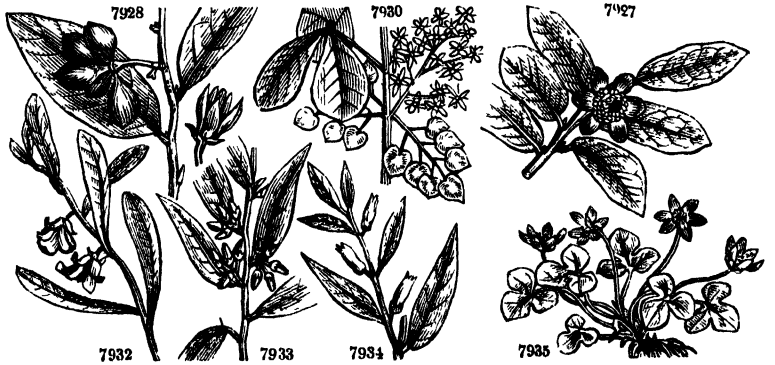
To bear fruit in our stoves, these trees require a rich loamy soil, rather moist, and to be trained on a wall or trellis close under the glass Ringing would also be useful They are propagated by ripened cuttings, of a good size, with their leaves on, planted in sand, and plunged in heat.

7918 Leaves lanceolate smooth

7919 Leaves lanc. acuminate, Pedunc. lateral solitary 1-flowered

7920 Leaves ovate lanceolate smooth somewhat shining, Pedunc. solitary 1-flowered
7921 Leaves ovate lanceolate not dotted very finely silky beneath, Outer petal downy outside

7922 Leaves lanceolate smooth with pellucid dots, Outer petals smooth
7923 Leaves obl acute somewhat downy above, silky and rufous beneath, Flowers on short stalks
7924 Leaves obl. lanc acute smooth somewhat dotted, Outer petals obl. somewhat closed
7925 Leaves ovate obl coriaceous very smooth, Fl solitary stalked
7926 Leaves ovate lanc smooth, Pedunc opposite the leaves 2-flowered



7927 Leaves obl lanc. acuminate smooth shining

7928 Leaves oval acuminate cordate covered beneath, as on the branches, with brown down
7929 Leaves ovate acuminate very smooth nearly sessile, Pedunc axillary 1-flowered

7930 Leaves obl cuneate acuminate, Branches quite smooth
7931 Leaves cuneate obovate mucronate beneath, as on the branches, rufous with down
7932 Leaves obl. linear long-cuneate, Branches quite smooth

7933 Leaves lanc. acuminate strigose beneath bearded at end
7934 Leaves obl. ovate smooth, Pedunc 1-fl solitary

7935 Leaves cordate 3-lobed, Lobes entire

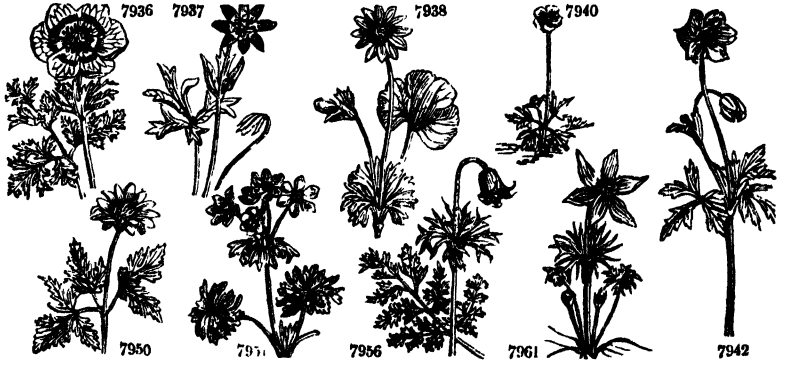
and Miscellaneous Particulars

1221 *Artabotrys.* This name was suggested by the curious grapple or tendril belonging to the peduncle, by which the growing fruit is conveniently suspended on the nearest support A beautiful Chinese plant, cultivated as an ornamental covering to walls, as well as on account of the fragrance of the blossom, which diffuses an odor like that proceeding from the finer kinds of ripe fruit. The genus is intermediate, between Kadsura and Guatteria.

1222. *Guatteria* Named by the authors of the Flora Peruviana, after John Baptist Guatteri, an Italian professor of botany at Parma G virgata is one of the best timber trees in Jamaica for strength and elasticity, it is imported under the name of lance-wood, and much used by coachmakers for shafts to light carriages

1223 *Asimina* A name coined by Adanson, without any meaning Shrubs with deciduous, oblong, often cuneate leaves, and axillary flowers, which often appear before the leaves The species are natives of shady woods in the more southern provinces of North America.

1224 *Xylopia.* Named by syncope from ξυλον πικρον, bitter wood, in allusion to the properties of the wood. Fruit-bearing trees, but not in much esteem as such X glabra is the most useful species. The wood, bark, and berries have an agreeable bitter taste, not unlike that of the orange seed The wild pigeons feed much upon the latter, and owe that delicate bitterish flavor, so peculiar to them in the season, wholly to this part of their food Fresh gathered from the tree, they are agreeable to the palate and grateful to the stomach. The bark is also richly impregnated with this juice as well as the wood, and both yield a very agreeable bitter in the mouth while fresh, but that delicacy diminishes greatly after they are dried The wood is easily wrought, and esteemed a good timber where it is not much exposed to the weather. The bitter quality of this tree is communicated with great facility. A handful of the shavings immersed in water and instantly taken out again, will render it of a very bitter taste Sugar sent over in hogsheads made of this wood was so bitter that no person would purchase it. Bedsteads and presses made of it, are proof against cockroaches and other insects Carpenters who work the wood, perceive a bitter taste in their mouths and throats. A decoction of it is said to be of service in cholics, and to create appetite



1225 *Hepatica* From ἡπατικος, of or relating to the liver The three lobes of the leaves have been compared to the three lobes of the liver A great favorite of the flower border, both as being evergreen in its foliage, and for its abundant blossoms and great variety of colors and shades.

History, Use, Propagation, Culture.

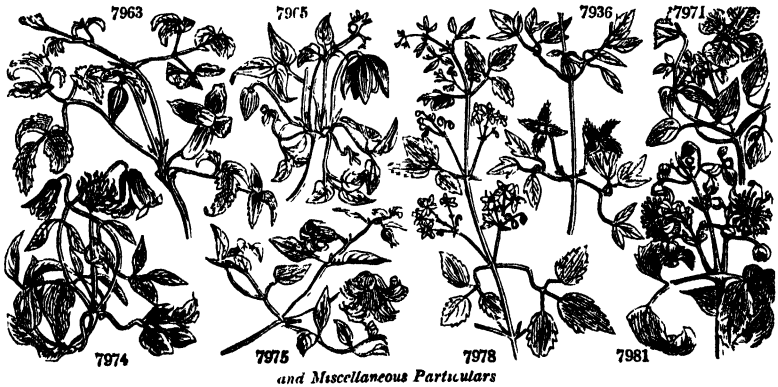
1226 *Anemone* From ἄνεμος, wind, because the greater part of the species grow in elevated places much exposed to the wind The species are shewy flowering plants, and A coronaria and hortensis are well known florists' flowers, valued for their hardy nature, and also because they will flower at almost any season, according to the time the roots are kept out of the ground, and the season when they are replanted. The prevailing colors are red, white, and blue, and semidouble flowers are in nearly as much repute as double ones. Many new varieties have been raised from seed, but they are not named by the florists, as in the case of tulips and and pinks. The roots of anemones are solid flattened masses like those of ginger, and like them are multiplied by division. A root which has remained in the soil two or three years, if it has room to extend, attains a great breadth, but is still only one root, and hence the mode of sale is by weight, and the roots are divided when planted.

The soil preferred by the anemone is a fresh loam, rather heavy or light The usual time of planting is the end of October, covering the roots three inches, but to have an early bloom they may be planted in the beginning of September, and to have a bloom every month in the year, plant every month. The finer sorts

7936 Leaves ternate with multifid segments and linear mucronate lobes, Sep. 6 oval close

7937 Leaves 3-parted with cuneate cut-toothed lobes, Involucre sessile obl. entire or cut, Sepals 10-12 oblong

7938 Leaves cordate roundish bluntly 3-5-lobed toothed, Involucre sessile trifid, Sepals 10-12 oblong
7939 Leaves ternate with cut-toothed ciliated segments, Involucre on short stalks 3 cut, Sepals 6 round
7940 Leaves ternate or quinate, Segments cut-toothed at the end, Involucre stalked similar, Sepals 5 obovate
7941 Lvs biternate with a branch stalk, Segm many-part with lin lobes, Inv shortly stalk multifid, Sep obl
7942 Leaves ternate or quinate, Segm cut-toothed at end, Involucre stalked similar, Sepals 6 elliptical
7943 Leaves 3-parted with cuneate cut-toothed lobes, Involucre sessile oblong entire or a little cut, Sep very acute
7944 Leaves ternate with trifid acuminate cut-toothed segments, Involucre stalked similar, Sepals 5 elliptical
7945 Involucre leaves on short stalks thrice cut with linear cut-toothed segments, Sepals 5-6 oval-oblong
7946 Leaves 3-parted with cut-toothed acuminate lobes, Involucre sessile similar, Sepals 5 elliptical, Fruit hairy
7947 Leaves 3-parted with cut-toothed oblong lobes, Involucre sessile similar, Sepals 5 elliptical, Fruit smooth
7948 Leaves all stalked ternate with ovate lanc acute-toothed segments, Sepals 5 elliptical obtuse
7949 Leaves ternate with trifid cut-toothed lanc acute segments, Involucre stalked similar, Sepals 6 elliptical
7950 Leaves 3-ternate with a branched stalk, Sepals 12-14 oblong obtuse, Leaves of involucre stalked
7951 Radical lvs 3-5 cut with subtrifid cut-toothed segments, Involucre stalk 3-parted toothed, Sep 5-6 elliptical
7952 Radical leaves villous palmate 3-5-parted with cut-toothed lobes, Lobes lin acute, Fl umbelled
7953 Flowers umbelled, Floral leaves stalked biternate forming a sort of involucre
7954 Leaves biternate with a branched petiole, Segm pinnated cut serrate, Sepals 6 spreading
7955 Leaves pinnated with multifid segments, Lobes linear, Flowers pendulous, Sepals 6 erect reflexed at end
7956 Like the last, but the flower larger and paler, and the lobes of the pinnæ broader and awned
7957 Leaves pinnated with multifid segments, Lobes linear, Flower somewhat nodding, Sepals 6 spreading
7958 Leaves pinnated very villous with 3-parted segments, Lobes lanc lin acum Fl erect, Sep 6 oval lanceol
7959 Leaves pinnated with cuneate lanceolate trifid smoothish segments, Fl. erect, Involucre very villous
7960 Leaves pinnated villous beneath, Segm pinnatifid, Lobes cut oblong, Fl subcernuous, Sep 6 spreading
7961 Leaves pinnate coming after the flowers, Segm 3-parted, Lobes toothed cut at end, Fl erect spreading
7962 Leaves biternate rigid smooth, Segm cuneiform toothed at end



7963 Peduncle 1-fl longer than leaf, Lvs biternate, Segm ovate-lanc acuminate serrate, Pet subspatulate obtuse
7964 Peduncle 1-fl the length of leaf, Leaves biternate with obl lanc acuminate segments, Pet emarginate at end
7965 Peduncle 1-fl Leaves whorled in fours ternate, Segm stalked cordate lanc entire, Petals acute

7966 Leaves pinnate, Segm glaucous smooth cuneiform lobed, Lobes entire blunt, Peduncle trifid
7967 Fl panicled, Leaves ternate, Segm ovate lanc acumin nearly entire smooth 5-nerved at base
7968 Leaves pinnated, Segm ovate lanc entire, Peduncle few-fl longer than leaf, Ovaries about 4, Tails almost
7969 Peduncle 1-fl with an involucrum, Leaves ovate subcordate toothed fascicled [naked
7970 Peduncle 1-fl longer than leaf, Leaves tern decompound, Segm ovate acute entire, Sepals much pointed

7971 Peduncle 1-fl longer than leaf, Leaves entire or ternate decomp Lobes or segm entire, Sepals obovate

7972 Peduncle 1-fl Sep connivent thick reflexed at end acuminate, Lvs smooth with ent or 3-lob ov acute segm
7973 Peduncle 1-fl Sep connivent, Lvs coriaceous netted nerved smooth with stalked 3-lobed or entire segments
7974 Peduncle 1-fl Sep acumin wavy at edge thin, Lvs smooth thin decompound with stalked ov or obl segm
7975 Peduncle 1-fl shorter than leaf, Leaves entire 3-lobed very acute, Sepals conniving at base spreading at end
7976 Peduncle 1-fl with an involucre under the leaf, Leaves ternate with stalked ternate cut-toothed segments

7977 Leaves pinnate with glaucous smooth wedge-shaped 3-lobed segments, Lobes toothed acuminate
7978 Fl panicled dioecious, Leaves ternate, Segm cordate acute coarsely toothed and lobed
7979 Fl panicled dioecious, Lvs tern Segm smooth ovate cordate acuminate 3-nerved ent. Pedicels pubescent
7980 Fl panic. dioec Sep 4 Lvs tern Segm ovate subcord acute coarsely toothed 3-nerv Anth awned at end
7981 Ped 3 1-fl or 3-fid or panic long than lvs Lvs tern or pinn Segm ovate coarsely toothed, Fl-buds globose

and Miscellaneous Particulars

require protection from violent storms and excessive light and heat, but many varieties do exceeding well in borders A very severe winter will destroy the roots if the surface is not mulched, but the anemone is considerably hardier than the ranunculus Anemone pulsatilla is common in borders The roots are mostly tuberous, and when taken up should not be long kept out of ground Like most tuberous plants, they thrive best in a sandy loam

1227 *Clematis* From κλημα, a tendril, the climbing habit of this genus is well known The species are mostly climbing shrubs of rapid growth, free-flowerers, very ornamental, and some are highly odoriferous. C florida, viticella, and flammula are admired species The plants formerly called Atragene, but now properly united to Clematis, are shewy climbers, especially C austriaca, which grows and flowers freely Any common garden soil will suit them, and they are readily increased by layers; or young cuttings, planted under a common hand-glass, will root freely. Seeds are often ripened in abundance, by which any quantity may be raised, they are best sown in pans, or wide-mouthed pots, and placed in a shady situation, where they will

History, Use, Propagation, Culture,

remain some time before they come up, they may then be potted off, or planted out in the ground, when they will require to be shaded a little if the weather be warm, till they have taken fresh root. (*Bot Cult.* 281)

1228. *Naravelia.* An alteration of *naravœl*, the name by which the plant is known in Ceylon. A plant with the habit of Clematis, but bearing leaves of only one opposite many-nerved pair, like Lathyrus

1229. *Thalictrum* This name is said to be derived from Θαλλω, to grow green, from the bright color of the young shoots The species are vigorous growing plants, with ramose roots and smooth finely divided leaves; they grow in any soil and situation, and T tuberosum, cornuti, and aquilegifolium, are reckoned handsome ornaments in a border or shrubbery

1230 *Adonis.* The plant which sprang from the blood of Adonis when wounded by the boar Handsome border flowers, especially A vernalis and autumnalis, and of the easiest culture in any common soil.

7982 Leaves pinnate with smooth subglaucous ovate cut-toothed 3-lobed segments
7983 Lvs. pinn. Segm. ovate-lanc cut-toothed acuminate truncate cordate at base, Pedunc. shorter than leaf
7984 Leaves pinnate, Segments smooth entire or 3-lobed round oval oblong or linear rather acute

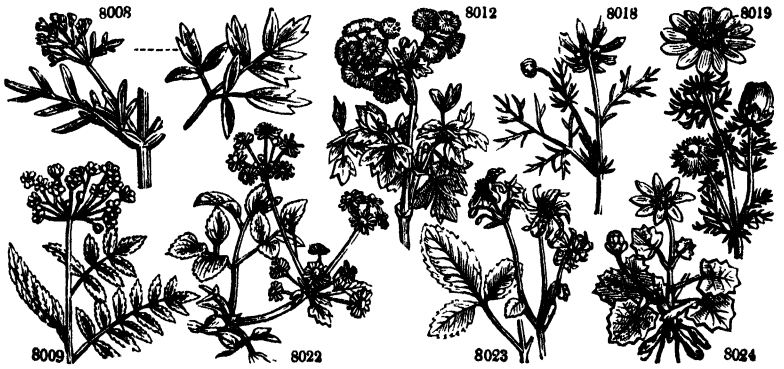
γ Segments linear
7985 Leaves pinnate with stalked ovate lanc. entire segments
7986 Pedunc 1-fl. Sepals 6-8 blunt, Leaves pinnate, Segm lanc lin acute or 3-lobed, Stems erect
7987 Pedunc 1-fl Fl suberect, Leaves entire ovate, young ones silky
7988 Pedunc. 1-fl Fl nodding, Leaves entire ovate lanc smooth

7989 The only species

7990 Stem simple almost naked, Raceme simple terminal, Fl nodding, Segm smooth
7991 Stem simple naked at base leafy in middle, panicled at end, Lvs pubescent viscid, Segm blunt toothed
7992 Fl loosely corymbose or subsolitary, Involucre none, Bract subsessile
7993 Fl dioecious, Filam clavate at end, Pericarp obl sessile striated, Segm of leaves bluntly 3-lobed

7994 Fl dioecious, Fil filiform, Segm of leaves roundish cordate bluntly lobed smooth
7995 Stem round without bloom, Fl panicled erect, Segm of leaves smooth ovate or subcordate subtrifid
7996 Stem round without bloom, Fl loosely panic Segm of leaves smooth glauc ben Peric obliq round at base
7997 Stem round without bloom, Fl. loosely panicled, Segm of lvs obl cuneiform sharply trifid upper entire
7998 St. round cover. with a glauc. bloom, Fl loose pan. cern Segm of lvs roundish tooth at end, glauc beneath
7999 Stem round upright, Fl. cernu in a very large spreading panic Segm of lvs smooth cuneif trifid acute
8000 St. erect round striat. green, Pan erect comp Fl clust Segm of lvs ov subcord coarsely cren shin above
8001 Stem roundish, Fl panic cernuous, Segm of lvs smooth ov cuneate trifid, Lobes acute entire or finely cut
8002 Stem round, Fl panicled cernuous, Petioles stem-clasping winged
8003 Stem simple covered with scattered leaves panicled at end, Stem downy viscid
8004 Fl dioecious or monoec Filam filif colored, Segm of lvs roundish coarsely tooth smooth glauc beneath
8005 Stem upright round somewhat furrowed, Root fibrous, Panic multiple erect, Segm of lvs lin lanc entire
8006 St branch round somew. furrow Root fibr Pan multiple erect, Segm of lvs lin lanc ent cuneate at base
8007 Stem branch erect somewhat furrowed, Root fibr Pan multiple erect, Segm of lvs cuneiform trifid acute
8008 St branch. erect somew furrow Root fibr Pan multiple erect, Segm of rad lvs cuneif trif Caul obl lin
8009 Stem erect round striat glauc Pan multip erect close, Seg of lvs subcord ov bluntly trifid glauc. beneath



8010 Leaves simple 5-lobed serrated
8011 Stem erect simple angular, Root creeping, Panic erect racemose few-flowered, Segm of leaves linear
8012 Stipules ovate, two at the base of the ramifications of the petiole, Panic corymb Fruit 3-cornered

8013 Stem round upright somewhat furrowed, Root creeping, Panic erect, Segm of lvs lin very narrow entire
8014 Stipules O, Fl loosely corymbose racemose, Fruit 3-cornered pendulous
8015 Stem round nearly naked, Fl corymb Filam dilated at end, Segm of lvs smooth ovate entire or 3-lobed

8016 Cal hispid at base, Pet flat obl blunt, Fruit netted in a long lax spike
8017 Cal smooth, Pet conc conniving scarcely longer than cal Fruit netted in an ovate head
8018 Cal hispid at base, Pet flat acute longer than cal Flower large, Fruit in a cylindrical head
8019 Lower leaves abortive, Upper sessile, Fruit velvety, Pet 10-12 oblong somewhat toothed
8020 Cal smooth distinct at base, Pet flat obl twice as long as cal Fruit smooth in an oblong head
8021 Rad. leaves on long stalks, Stalks trifid, Fruit smooth, Pet 8-10 obl cuneate entire

8022 Umb supradecompound much spreading
8023 Umb simple few-flowered

8024 Root grumous, Stem leafy, Leaves cordate

and Miscellaneous Particulars

1231 ***Knowltonia.*** Named after Thomas Knowlton, once the curator of the botanic garden at Eltham The species grow freely in loam and peat, and are increased by dividing at the root, and by seeds

1232 ***Ficaria.*** So named because the grumous roots bear tubercles like little figs A common wood plant, remarkable for its shining leaves and bright yellow flowers. The young leaves are sometimes used as greens in Sweden, and the roots were formerly applied in poultices to piles in England, probably from their resemblance to that disease. These roots or tubercles lie near the surface, and are sometimes laid bare by the rains, and in this state have induced the ignorant, under the influence of superstition, to fancy that it rained wheat. The plant is injurious in moist grass lands, but is effectually destroyed by a dressing of coal or wood ashes.

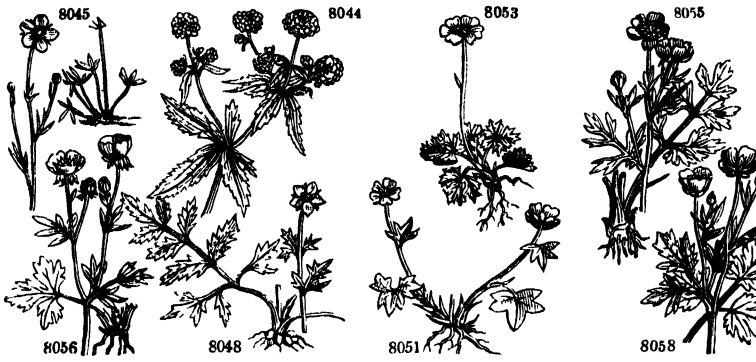
History, Use, Propagation, Culture,

1233 *Ranunculus* Said to be so called from *rana*, a frog, because the species inhabit humid places frequented by that reptile *Renoncule*, Fr, *Ranunkel*, Ger, and *Ranuncolo*, Ital Some of the species are weeds, one or two border flowers, and R asiaticus is one of our most esteemed florists' flowers. Some of the species are tuberous and others bulbous rooted, but the most part are tuberous R sceleratus is one of the most virulent of our native plants Bruised and applied to the skin it soon raises a blister, and makes a sore by no means easy to heal Strolling beggars have been said to use it for that purpose, in order to excite compassion When chewed, it inflames the tongue, and when taken into the stomach, it produces violent effects It is suspected to have proved poisonous to sheep

R. aconitifolius is a handsome plant, with branching stems, deep green leaves, and pure white flowers, the double variety is an old and much admired border flower

Of R asiaticus the varieties raised from seed are endless Maddock, in the end of the last century, had nearly eight hundred, all with proper names, and ranged as purple, gray, crimson, red, rose, orange, yellow, white, olive, coffee, striped, spotted, &c No plant is more prolific in new varieties from seeds, no two plants, as Maddock observes, producing flowers alike, or the same as the original Established sorts are propagated by offsets, which generally flower the first year rare sorts may be multiplied by dividing the crown of the tuber with a sharp penknife into as many parts as there are buds these will not flower till the second year, but will diminish the risk of losing a very rare variety

The ranunculus prefers a fresh loamy soil, rather than otherwise inclined to clay · it should be well manured, and it is customary, in forming the beds, to place a stratum of well rotted cow-dung six or nine inches below the surface, which both retains moisture and supplies nourishment The roots may either be planted in November or earlier, in which case, to prevent their being destroyed by the frost, they should be mulched, or they need not be planted till March The former mode gives much the strongest bloom, as the roots, when kept in air all the winter, are apt to be over dried, and kept in sand they sometimes get mouldy and in this and similar cases, the progress of vegetation from the planting to the blossoming period, is more rapid than is natural to the species Ranunculus roots will retain their vegetative properties two and sometimes three years, a thing not common among bulbs and tubers, unless preserved dormant in an ice cold room



R. bulbosus has a solid white bulb about the size of that of the common Crocus The flowers are some-

8025 Leaves smooth lin. lanc lower stalked, Stem declinate solid rooting at base, Fruit smooth

and Miscellaneous Particulars

times double, but not so frequently as R acris It is distinguished from R repens, with which it has been confounded by some authors, by its roots, by its never throwing out runners, and by its reflexed calyx, this last character arises from its particular structure, the lower half being thin and almost transparent, and therefore not having a sufficient degree of solidity to support itself upright It is the second flower which, next to the Dandelion, covers the meadows with dazzling yellow Like most of the Crow-foots, it possesses the property of inflaming and blistering the skin, particularly the root, which is said to raise blisters with less pain and more safety than Spanish flies, hence these roots have been applied for that purpose, particularly to the joints in cases of the gout According to Hoffman, beggars make use of them to blister their skins, with a view of exciting compassion The juice of the herb is said to be more acrid than that of R sceleratus, and if applied to the nostrils, it provokes sneezing The roots, on being kept, lose their stimulating quality, and are even eatable when boiled Hogs are fond of them, and frequently dig them up. The herb is too acrid to be eaten unmixed by cattle, accordingly the flowering-stalks are left to perfect the seed in pastures some of it, however, is consumed, and it is not improbable that this and other pungent plants, mixed with the grasses, may act as a powerful stimulus to some animals, as salt does to others It abounds in dry pastures, and flowers in May Besides the name of round-rooted or bulbous Crowfoot, it is called by the common people butter-flower, butter-cups, king-cups, gold-cups, and it is the cuckoo-buds of yellow hue, of Shakspeare. R. repens, hirsutus, and acris, however, are all confounded with this under one name by the vulgar

R repens is an obnoxious plant in every description of gardening and agriculture. From the great variety of soil and situation in which it is found, it assumes many varieties, by a river's side, or in marshes, it will grow three or four feet high, with a stem nearly as large as the human thumb, in barren gravelly fields it is entirely procumbent, with a stem not larger than a small wheat-straw; but in all states it retains the character of the creeping stem, and it does not lose it in cultivation Its principal time of flowering is in June, but it may be found in blossom during most of the ensuing summer months in meadows and pastures, under hedges, in shady waste places, church-yards, and gardens The qualities of this and bulbosus are similar both blister the skin, and are very acrid in taste Like R. acris and bulbosus, it is sometimes found double, but more rarely.

R. acris is supposed to possess the blistering property in a considerable degree, whence Linnæus gave it the

History, Use, Propagation, Culture

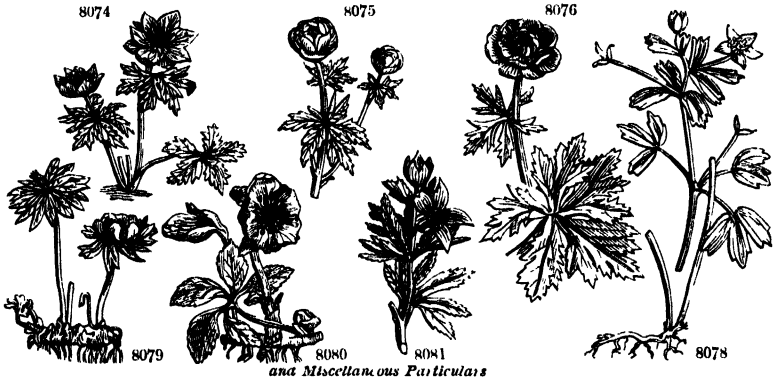
name of acris Curtis says, that even pulling up the plant, and carrying it to some little distance, has produced a considerable inflammation in the palm of the hand that cattle, in general, will not eat it, yet that sometimes, when they are turned hungry into a new field of grass, or have but a small spot to range in, they will feed on it, and hence their mouths have become sore and blistered According to Linnæus, sheep and goats eat it, but kine, horses, and swine refuse it When made into hay it loses its acrid quality, but then it seems to be too stalky and hard to afford much nourishment if it be of any use it must be to correct, by its warmth, the insipidity of the grasses In many pastures the flowering stems are left standing in vast abundance to disseminate their seeds before they do that, they might easily be cut down with the scythe, or pulled up by women and children after a shower, which would more effectually destroy the plants, they should be gathered into heaps and burnt It flowers in June and July, and is confounded vulgarly with the repens and bulbosus, under the name of butter-flower or butter-cups, under a notion that the yellow color of butter is owing to these plants It is the richness and exuberance of the pasture that communicates this color, and not these flowers, which the cattle seldom or ever touch It is frequent in gardens with a double flower, among other herbaceous perennials, under the name of yellow bachelor's buttons

R. aquatilis produces flowers which are sometimes very large, and make a handsome show in ponds and ditches. the curious variety in the floating and immersed leaves, occasioned by the depth and velocity of the stream, adds to the beauty of this common aquatic plant. Dr Pulteney (*Linn Trans* vol 5 p 19) contradicts the assertions of its deleterious qualities, and proves that it is not merely innoxious, but nutritive to cattle, and capable of being converted to useful purposes in agricultural economy In the neighbourhood of Ringwood, on the borders of the Avon, some of the cottagers support their cows, and even horses, almost wholly by this plant. A man collects a quantity every morning, and brings it in a boat to the edge of the water, from which the cows eat it with great avidity, insomuch that they stint them, and allow only about twenty-five or thirty pounds to each cow daily One man kept five cows and one horse so much on this plant with the little which the heath afforded, that they had not consumed more than half a ton of hay throughout the whole year, none being used except when the river is frozen over. Hogs also are fed with this plant, and improve so well on it, that it is not necessary to give them any other sustenance till they are put up to fatten This property of water-crowfoot is the more remarkable, as all the species have been deemed acrimonious, and some of them are, without doubt, highly so It is probable this species is rendered inert as a poison by growing in the water; although it must be confessed, that in other instances moisture heightens the deleterious property of vegetables, especially in the umbelliferous tribe.

8061 Leaves trifid silky, Lobes broad toothed cut, Stem and petiole with reflexed hairs, Grains hooked
8062 A small variety of R. hirsutus, with a dwarf 1-flowered stem
8063 Lvs. reniform 3-5-lobed with broad entire blunt lobes, Pet. scarcely longer than cal Petals 5-12 [bristles
8064 The submersed lvs capill multifid emersed 3-part. with cuneif lobes tooth at end, Grains hispid with stiff
8065 The submersed lvs capillary multifid: emersed 3-part with cuneif lobes toothed at end, Grains smooth
8066 All the leaves capillary multifid, Pet obovate larger than calyx, Grains smooth

8067 Leaves smooth · radical 3-parted, cauline multifid with lin lobes, Grains with long prickles on each side
8068 Lvs vill. radic stalk. ov 3-part cut, floral 3-part. Stem erect dichotom with spread hairs, Grains muric
8069 Lvs smooth stalk bifid, Lobes oval obl divaricat the mid entire, Sheaths auricled at base, Stem filiform
8070 Radical leaves round with 5 cut lobes cauline sessile palmate, Stem pubescent, Cal subvillous
8071 Rad lvs trifid beyond midd with cuneif trifid lobes, Stem with spread hairs, Grains hooked with style
8072 Lvs smooth stalk roundish 3-lob coarsely tooth. Pedunc opp lvs Cal. spreading, Grains muricate cornute
8073 Lvs vill round 3-lob coarsely tooth. Stems soft decumb Cal reflexed as long as pet Grains tuberculate

8074 Sepals 5-10 spreading, Pet 10-15 shorter than stamens



8075 Sepals 15 globose, Pet 5-10 the length of stamens
8076 Sepals 10 spreading, Pet 10 longer than stamens

8077 Caps 10-20, Sepals acute, Root slender nearly simple perpendicular
8078 Caps 1-3, Sepals blunt, Root creeping grumous

8079 Sepals 6-8-oblong

8080 Radical leaves pedate smooth, Scape leafless with 1-2-fl and bractes
8081 Radical leaves pedate smooth, cauline subsessile palmate, Sepals roundish ovate green
8082 Radical leaves palmate downy beneath, Segm cuneate at base 3-5-lobed at end, Sepals roundish colored
8083 Radical leaves palmate downy beneath, Segm obl undivided serrate at end, Sepals ovate obl acute green
8084 Radical leaves very smooth pedate cauline subsessile palmate, Sepals roundish green
8085 Stem many-fl leafy, Leaves pedate very smooth with obl linear segments
8086 Stem many-fl leafy, Leaves 3 cut smooth glaucous beneath, Segments ovate-lanceolate

8087 Leaves trifid with obovate toothed blunt 3-lobed segments, Scape 1-flowered

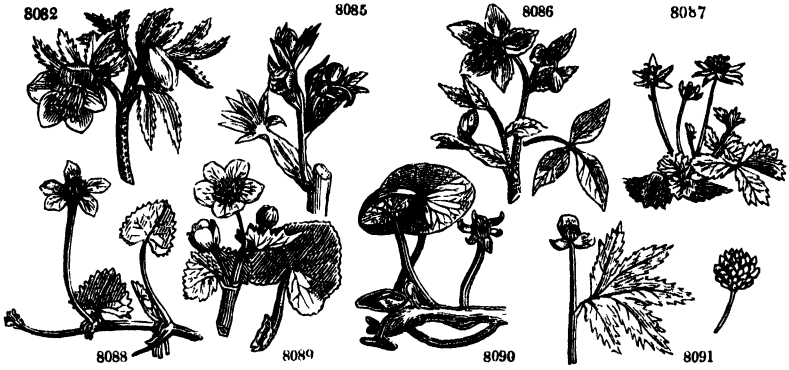
and Miscellaneous Particulars

This remark of Dr Pulteney's is the more important, as in the Swedish experiments the R aquatilis is recorded as the only one rejected by all the species of domestic cattle, of the common sorts, there is no doubt but that R. Flammula, bulbosus, acris, sceleratus, and arvensis are acrimonious Before the introduction of Cantharides they were used as vesicatories, and are said to act with less pain than flies, without any effect on the urinary passages, but their action is related to be uncertain, and they are accused of frequently leaving ill-conditioned ulcers

The acrimony, even of the most virulent, is wholly dissipated in drying, so that in form of hay they appear to be harmless It is also expelled in decoction, accordingly, the shepherds of Morlachia boil the R sceleratus and eat it, and both R. auricomus and repens are said to be wholly inoffensive, and are ranked by some authors among oleraceous plants

The Ranunculi give out their acrimony wholly in distillation The distilled water of R. sceleratus is intensely acrimonious, and when cold deposits crystals, which are scarcely soluble in any menstruum, and are of an inflammable nature

1234. *Trollius* A name given to this plant by Conrad Gesner It is derived from *trol* or *trolen*, an old German word, signifying something round, in allusion to the form of the flowers The species are showy flowers for the general border, and of the easiest possible culture



1235 *Isopyrum.* A name given by the Greeks to a plant resembling Nigella, the seeds of which had the same taste These are small herbaceous plants related to Nigella, but with the habit of Thalictrum

1236 *Eranthis* From ἠρα, the earth, and ἀνθος, flower, because the bright yellow blossoms seem to lie upon the earth A pretty little tuberous rooted plant, valuable for the early period at which it flowers

1237. *Helleborus.* From ἑλειν, to cause death, and βορα, food The dangerous qualities of Hellebore are well known Leathery leaved plants, most of which are evergreen, and flower in winter and early in spring H niger and fœtidus have long been in use in popular medicine, especially the latter, as a vermifuge and cathartic They are both admitted in the London Materia Medica, but being violent poisons, require caution in their application H fœtidus, from its deep green and finely divided leaves, forms a most ornamental evergreen bush for the shrubbery

1238 *Coptis* From κοπτω, to cut, in reference to the numerous divisions of the leaves. Small plants, with the habit of Trientalis.

History, Use, Propagation, Culture,

1239 *Caltha* A syncope of καλαθος, a goblet, in allusion to the form of the corolla, which may be likened to a golden cup The flower-buds of C palustris, gathered before they expand, are said to be a good substitute for capers The juice of the petals boiled with alum dyes paper yellow The whole plant is acrid, and not eaten by cows, unless in case of extreme hunger

CLASS XIV. — DIDYNAMIA. 4 STAMENS, of which two are shorter than the others.

THIS class, which, as its name applies, depends upon the presence of four stamens in the corolla, two of them being longer than the others, is, with the exception of Syngenesia and Gynandria, the most natural and best defined of all Linnæus's great groups, or, as he named them, classes. It is divided into two orders, called Gymnosperm.a and Angiospermia

Gymnospermia contains all the genera with what are popularly but erroneously called by the Linnæan school of botany, naked seeds It answers to the natural order of Labiatæ of Jussieu's method, with the exception of some genera which are excluded on account of having only two stamens, and are found in Diandria Nearly all the class consists of herbaceous plants, those which are called shrubs being for the most part herbaceous plants, whose stems, from the mildness of the climate in which they grow, become perennial The most remarkable plants are the rosemary, hyssop, balm, thyme, mint, and marjoram, for the kitchen or laboratory, and the various species of Teucrium, Lavandula, Phlomis, and Dracocephalum, for the flower garden

In Angiospermia are included the genera with numerous, or rarely a few, seeds, enclosed in a simple pericarpium. These would be combined in a manner not altogether unnatural, if some of the genera were excluded For instance, the beautiful Linnæa, the emblem of the most highly gifted naturalist the world has ever produced, belongs to Caprifoliaceæ, and stands alone in point of natural affinity, the same may be said of Melianthus The greater part of Scrophularineæ, all Melampyraceæ and Orobanchcæ, and nearly the whole of Verbenaceæ and Gesneriæ are found here A considerable portion of Acanthaceæ also occupy a station in this order Among these are many genera of much beauty, but few of interest as useful plants Among the ornamental families every one will recognize the Bignonia, with its elegant orange or yellow trumpet flowers, and frequently twining stem, the Jacaranda, with its fern-like umbrageous foliage and magnificent diadem of blue, the Acanthus, consecrated to sculpture, the noble Clerodendrum, the pride of the Japanese, and the modest Eyebright (Euphrasia) of our English meadows In one part of the class we have the Vervain, surrounded by its mystic moonlight charms, in another, the Antirrhinum tribe, remarkable for the grotesque resemblance of its blossoms to the snouts of animals, and close behind it, imperial Pedicularis, proudly rearing her heraldic honours among the snows and deserts of the frozen north These are succeeded by a long line of forms, principally European, and of various degrees of beauty Among the useful plants, Digitalis, used in medicine, and Sesamum as oil seed, are all which can be particularized.

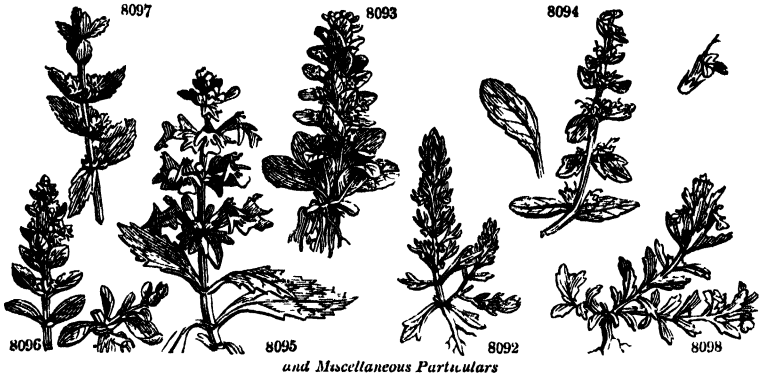
Order 1. GYMNOSPERMIA.

Pericarpium divided into four lobes resembling naked seeds.

1242. *Ajuga* Upper lip of cor very minute, 2-toothed. Stamens longer than upper lip

1243 *Ansomeles* Calyx tubular, 10-striated, 5-cleft. Upper lip of corolla small, entire; lower trifid, with the middle segment 2-lobed Stamens exserted, ascending Anthers of the short stamens 2-celled, with close cells, of the longer halved or dissimilar. Seeds smooth

1244 *Teucrium.* Upper lip of cor none, 2-parted beyond the base Stamens exserted



1245. *Westringia* Cal campanulate, 5-toothed Corolla subrotate, with the upper segment bifid. Two of the anthers barren

1246. *Satureja* Cal tubular, striated. Segments of corolla nearly equal Stamens distant.

8088 Stem creeping, Leaves triangular cordate serrate crenate
8089 Stem erect, Leaves cordate roundish crenate with round auricles

8090 An aquatic floating plant, covered all over with viscid slime, Roots fibrous

8091 The only species A small plant with simple stems and a few 3-5-parted leaves

and Miscellaneous Particulars

1240 *Hydropeltis* From ὑδωρ, water, and πελτη, a buckler, that is to say, a water-plant, with a leaf like a round shield A curious little floater, with the aspect of Hydrocharis
1241 *Hydrastis* From ὑδωρ, water, in reference to the humid places wherein it grows The root of this plant is yellow, bitter, pungent, and tonical

---

1247 *Thymbra.* Cal subcylindrical, 2-lipped, with a villous furrowed line on each side. Segm. of cor flat Style half bifid
1248 *Hyssopus* Lower lip of cor 3-parted, with the intermediate segm subcrenate Stamens straight, distant
1249 *Nepeta* Cal dry, striated Cor with a longish tube, the middle segments of lower lip crenate Orifice reflexed at edge Stamens approximating
1250 *Elsholtzia* Cal tubular, 5-toothed Upper lip of corolla 4-toothed, lower longer, undivided, somewhat crenulate Stamens distant
1251. *Lavandula* Cal. ovate, somewhat toothed, supported by a bractea Corolla resupinate Stamens within the tube
1252 *Sideritis* Cal 5-fid Cor ringent or subregular the upper lip bifid, lower 3-parted Stamens within the tube The short stigma wrapping over the other
1253 *Bystropogon* Cal with 5 subulate teeth, closed at the orifice with hairs Upper lip of cor bifid; lower trifid Stamens distant
1254 *Mentha* Cor nearly equal, 4-fid, with the broadest segment emarginate Stamens erect, distant
1255 *Perilla* Cal with the upper segment very short Stamens distant Styles 2, united
1256 *Hyptis* Cal 5-toothed, increasing in size Corolla ringent the upper lip bifid, the lower 3-parted, with the intermediate segment shaped like a little bag Stamens inserted in the swollen part of the tube, and declinate
1257 *Horminum* Cal 2-lipped, awned, smooth in the orifice, when past flower, having its upper teeth crossing each other. Upper lip of corolla 2-lobed, lower 3-lobed, with nearly equal segments Leaves radical. Scape nearly naked
1258 *Glechoma* Cal 5-fid Each pair of anthers forming by their union the figure of a cross
1259 *Lamium* Upper lip of corolla entire, vaulted, lower 2-lobed, the orifice toothed at the edge on both sides
1260 *Galeopsis* Upper lip of corolla somewhat crenate, vaulted, lower 2-toothed above.
1261 *Galeobdolon* Cal 5-fid, unequal, awned Upper lip of corolla vaulted, entire, lower trifid, with acute segments Anthers smooth
1262. *Betonica* Calyx awned Upper lip of cor ascending, flattish Tube cylindrical
1263. *Stachys* Upper lip of cor vaulted, lower reflexed at edges, intermediate larger and emarginate. Stamens after flowering reflexed towards the sides
1264 *Zietenia* Cal 5-parted, with subulate very long equal segments Segments of lower lip of cor reflexed, intermediate folded together and emarginate Stamens after flowering reflexed towards the sides. Grain one
1265 *Ballota* Cal. hypocrateriform, 5-toothed, 10-lined Upper lip of cor crenate concave Grains ovate 3-cornered
1266. *Marrubium* Cal hypocrateriform, rigid, 10 lined Upper lip of cor bifid, linear, straight
1267 *Leonurus* Cal 5-angled, 5-toothed Upper lip of cor villous, flat, entire, lower 3-parted, with the middle segment undivided Anthers covered, with shining spots
1268. *Phlomis* Calyx 5-angled, 5-toothed Helmet compressed, keeled, emarginate Seeds bearded at end
1269 *Leucas.* Cal tubular, 10-striated, 8-10-toothed, with an orifice, either equal or oblique Corolla ringent Helmet concave, entire, bearded lower lip 3-fid, with the middle segment largest Anthers twin, beardless, with divaricating lobes Stigma 2-lipped, with the upper segment very short.
1270 *Leonotis.* Differs from the last in having an elongated helmet, and the lower lip small and withering the middle segment scarcely larger than the others
1271 *Moluccella* Cal campanulate, enlarged, wider than corolla, spiny
1272. *Clinopodium.* Involucre of many bristles beneath the whorl Corolla 2-lipped. Upper lip of corolla flat, obcordate, straight.

1273. *Pycnanthemum.* Involucre of many bractes beneath the little heads Cal. tubular, striated. Upper lip of corolla nearly entire, lower trifid Stamens nearly equal.
1274. *Origanum* Cone 4-cornered, spiked, collecting the calyxes Upper lip of corolla erect, flat, lower 3-parted, with nearly equal segments
1275. *Thymus* Orifice of bilabiate calyx closed with hairs Upper limb of corolla flat, emarginate
1276 *Acynos* Cal 2-lipped, furrowed, hispid, gibbous at base, villous at orifice Cor ringent, inflated at orifice, with the upper lip erect, emarginate, the lower 3-parted, spreading. intermediate segm. concave All the stamens fertile
1277 *Calamintha* Cal after flowering closed by hairs Orifice of cor inflated. Upper lip emarginate, lower 3-parted, with the intermediate segment entire, subemarginate or crenulate
1278 *Melissa* Cal dry, flattish above, with the upper lip somewhat fastigiate Upper lip of cor. somewhat vaulted, 2-fid lower less, with middle lobe cordate
1279 *Dracocephalum.* Cor inflated at orifice, with the upper lip concave
1280 *Melittis* Cal smooth, campanulate, blunt, oblique at orifice. Upper lip of cor flat, lower crenate Anthers cruciate
1281 *Ocymum* Cal with the upper lip orbicular, lower 4-fid. Corolla resupinate, with one lip 4-cleft, the other undivided Exterior filaments having a process at their base
1282 *Plectranthus* Upper lip of cal largest Corolla resupinate, ringent, with the tube gibbous upwards, or spurred
1283 *Trichostema* Upper lip of cor falcate, Stamens very long
1284 *Prostanthera* Calyx 2-lipped, in fruit closed Tube striated, lips undivided, blunt. Corolla ringent, with a half bifid helmet middle segment of lower lip large, 2-lobed Anthers spurred beneath
1285 *Scutellaria* Cal entire, after flowering closed with a lid Tube of the corolla elongated
1286 *Prunella* Upper lip of calyx dilated. Filaments forked, upon one point bearing their anthers. Stigma bifid
1287 *Cleonia* Filaments forked, upon one point bearing their anthers Stigma bifid
1288 *Prasium* Cal campanulate, 2-lipped Upper lip of cor. vaulted, lower trifid, with the middle segm. largest cordate Grains berried
1289 *Phryma* Cal 2-lipped, 5-toothed. Grain only one

Order 2 ANGIOSPERMIA  Seeds several, enclosed in an undivided pericarpium.

I *Ovary inferior, or nearly inferior*

1290. *Gesneria* Cal 5-fid Corolla incurved and recurved Capsule 2-celled
1291 *Gloxinia.* Cal 5-leaved Cor campanulate, with an oblique limb Filaments with the rudiment of a fifth inserted upon the receptacle
1292 *Linnæa* Cal double of the fruit 2-leaved, of the flower 5-parted Cor campanulate Berry dry, 3-celled.

II *Ovary superior, polypetalous*

1293 *Melianthus* Cal. 5-leaved, with the lower leaflet gibbous Petals 4, with the nectary below the lowest Capsule 4-celled

III *Ovary superior, monopetalous*

A *Filaments 5, the upper only rudimentary*

1294 *Bignonia* Cal 5-fid, cup-shaped Cor campanulate, 5-fid, ventricose beneath Pod 2-celled Seeds with membranous wings
1295 *Jacaranda* Cal 5-toothed Cor tubular at base, with a dilated throat, and a 5-lobed unequal limb Fifth filament sterile, long, villous at end Stigma with two lips Capsule large, round, woody, with the edge dividing into two valves
1296 *Sesamum* Cal 5-parted Cor campanulate 5-fid, with the lower lobe largest. Stigma lanceolate Capsule 2-celled, the cells divided in two by the inflexed edges of the valves
1297 *Penstemon* Cal 5-leaved Cor 2-lipped, ventricose Fifth filament longer than the rest, and bearded at its upper end Capsule compressed, 2-celled, 2-valved Seeds numerous, subglobose
1298 *Chelone* Cal 5-parted, with two bractes Cor ringent, ventricose Fifth filament shorter than the others Caps 2-celled, 2-valved Seeds numerous, with a membranous edge
1299 *Tourretia* Cal 2-lipped Corolla ringent the upper lip galeate, large, lower 2-toothed, very small Nectary annular, 4-lobed Stigma truncate Capsule 4-celled Dissepiments with 4 wings Seeds cordate
1300 *Martynia* Cal 5-fid Cor ringent Capsule woody, coated, with a hooked beak, 4-celled, 2-valved.

B *Filaments 4 Capsule many-seeded, opening with elasticity. Seeds large, flat.*

* *Calyx bifid*

1301 *Acanthus* Cal 4-parted the two lateral inner segments short, the two outer long, with 3 bractes, of which the middle one is toothed, spiny Cor labiate, having the orifice closed with hairs. Lower lip very large, 3-lobed. Anthers villous Stigma bifid Caps ovate, with 1-2-seeded cells.

** *Calyx 4-fid*

1302 *Barleria* Cal 4-parted. Stamens 2, much smaller than the others Capsule with 4 angles, 2-celled, 2-valved, elastic, without claws Seeds 2

*** *Calyx 5-fid*

1303 *Phaylopsis* Calyx unequal, with a large dorsal segment Cells of the ovary 2-seeded, with the segments of the dissepiment spontaneously dividing in two Otherwise like Blechum
1304 *Ruellia* Cal 5-parted, generally with two bractes Corolla campanulate, with a 5-lobed limb Stamens in pairs Capsule narrowed to each end. Teeth opening elastically Seeds not many
1305 *Blechum* Cal 5-parted, equal Cor funnel-shaped Capsule about 2-celled, 2-valved the segments of the crosswise dissepiment finally becoming loose Seeds many, with hooks
1306. *Aphelandra* Cal 5-parted, unequal Cal 2-lipped Anthers 1-celled. Capsule 2-celled, 2-valved, with a dissepiment crosswise Seeds with hooks
1307 *Crossandra* Cal 5-parted, unequal Cor 1-lipped. Stamens included. Anthers 1-celled. Capsule 2-celled, 2-valved, with a dissepiment crosswise Seeds with hooks

**** *Calyx multifid.*

1308. *Thunbergia.* Cal double outer 2-leaved, inner about 12-toothed Cor. campanulate Capsule beaked, 2-celled.

C. *Filaments 4. Capsule, drupa, or berry few seeded Seeds erect.*

* *Calyx bifid*

1309 *Hebenstreitia.* Cal spathaceous, opening lengthwise beneath. Cor tubular, unequal, with one upper 4-fid lip Stamens projecting from the lower cleft of the corolla Caps 2-seeded.

** *Calyx 4-fid.*

1310 *Hosta.* Cal obsoletely 2-lipped, 4-toothed. Corolla ringent, with the middle segment of the lower lip large, emarginate. Drupe with a 4-celled, 4-seeded nut.
1311 *Gmelina* Cal. about 4-toothed. Cor 4-fid, campanulate Two of the anthers 2-parted, 2-simple. Drupe baccate Putamen bony, 4-celled Cells 1-seeded, the lower sterile
1312 *Lantana* Flowers capitate Cal obsoletely 4-toothed. Limb of corolla 4-fid, with an open orifice. Stigma hooked backwards Drupes heaped, with a 2-celled smooth nut.
1313 *Aloysia.* Calyx deeply 4-cleft Corolla tubular, 4-lobed Stigma emarginate. Stamens 4, perfect. Seeds two
1314 *Lippia* Flowers capitate Cal 4-toothed, roundish, erect, compressed, membranous. Corolla 4-fid, funnel-shaped Drupe dry, 1-seeded, thin, covered by the calyx Nuts two, 1-seeded
1315. *Melampyrum* Capsule 2-celled. Seeds 2, gibbous, polished

*** *Calyx 5-fid*

1316. *Selago* Cal 5-fid Tube of corolla filiform Limb nearly equal. Capsule simple or 2-lobed, each lobe with a seed
1317 *Vitex* Cal 5-toothed Limb of cor 5-6-fid Drupe 1-seeded, with a 4-celled nut.
1318. *Cornutia.* Cal 5-toothed. Stamens longer than corolla Style very long Berry 1-seeded
1319 *Zapania* Flowers capitate Cal 5-toothed Cor 5-fid. Stigma peltate, capitate, oblique. Fruit covered, bladdery, enclosing two seeds
1320 *Priva* Cal inflated, 5-toothed Cor a little longer than the tube of calyx, contracted at orifice. Drupe covered by the calyx Nuts two, 2-celled, 2-seeded Stamens 2-4
1321 *Spielmannia* Cal. 5-fid Limb of cor 5-fid, the orifice closed by hairs. Stigma hooked Drupe with a 2-celled warted nut
1322 *Verbena* Cal 5-fid Cor funnel-shaped, with an incurved tube, and an unequal 5-fid limb. Stamens 4, fertile Fruit bladdery, covered, withering Seeds 4
1323 *Avicennia* Cal 5-parted Cor. 2-lipped the upper lip square Caps coriaceous, rhomboid, 1-seeded. Seed germinating within the capsule
1324 *Caldasia* Cal tubular, 5-toothed Cor hypocrateriform, nearly equal Filaments inserted in top of tube Caps 3-celled, 3-seeded, 3-valved Seeds elliptical
1325 *Clerodendrum* Cal 5-fid, campanulate Corolla with a filiform tube and a 5-parted equal limb Stamens very long, projecting from between the segments of corolla Drupe 4-seeded, with a 1-celled nut
1326 *Volkameria* Cal 5-fid Cor with 1-sided segments Drupe 2-seeded Nuts 2-celled, with 1-seeded cells
1327 *Holmskioldia* Cal colored, very large, campanulate, spreading, with a nearly entire limb a little shorter than the ringent corolla
1328 *Petrœa* Cal 5-parted, very large, colored Corolla rotate Caps 2-celled, 2-seeded in the bottom of the calyx Seeds solitary
1329 *Cuthrexylum* Cal 5-toothed, campanulate Corolla funnel-shaped, rotate Segments villous, above equal Drupe 2-seeded Nuts 2-celled
1330 *Duranta* Cal 5-fid, superior Drupe 4-seeded, covered by the calyx Nut 4-2-celled, 2-seeded
1331 *Pedalium.* Cal 5-parted Cor tubular, ringent, with a 5-cleft limb Filaments hairy at base Anthers in pairs, forming a cross Nut corky, with spiny angles Seeds 2, with an arillus
1332 *Myoporum* Cal 5-parted Corolla campanulate, with a spreading nearly equal 5-parted limb Drupe 1-2-seeded, with 2-celled nuts
1333 *Stenochilus* Cal 5-parted. Cor ringent the upper lip erect, half 4-cleft lower undivided, narrow, deflexed Stamens didynamous, exserted. Ovary 4-celled, with 1-seeded cells Stigma blunt, undivided Drupe berried, 4-celled Seeds solitary
1334 *Bontia* Cal 5-parted Cor 2-lipped, with an oblong tube the lower lip 3-parted, revolute Drupe ovate, 1-seeded, oblique at end

D *Filaments 4 Capsule or berry many-seeded Seeds small, attached to a central receptacle.*

* *Calyx bifid.*

1335 *Orobanche* Cal of 2-lobed lateral leaflets Corolla ringent. Capsule 1-celled, 2-valved, many-seeded Gland at the base of the ovary
1336. *Crescentia* Cal 2-parted, equal Corolla gibbous Berry stalked, 1-celled, many-seeded. Seeds immersed in pulp
1337 *Castilleja* Cal spathaceous, the upper lip bind, lower none Cor 2-lipped the lower lip very short, trifid, with 2 glands between the segments Caps 2-celled

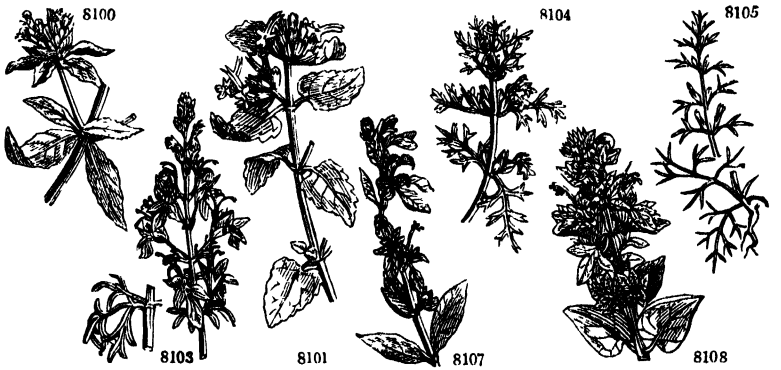
** *Calyx trifid*

1338 *Halleria* Cal 3 or 5-leaved Cor 4-fid, somewhat inflated Berry 2-celled, many-seeded

*** *Calyx 4-fid*

1339 *Lathræa* Cal 4-fid A depressed gland at the base of the suture of the ovary Capsule 1-celled.
1340 *Rhinanthus* Cal 4-fid, ventricose Cor ringent, with the upper lip generally compressed. Capsule 2-celled, blunt, compressed
1341. *Bartsia* Cal. 4-lobed, emarginate, colored Cor smaller than the calyx the upper lip longest Capsule 2-celled Seeds angular
1342. *Euphrasia* Cal cylindrical, 4-fid Corolla 2-lipped the upper lip bifid, the lower 3-lobed, with bifid lobes. Lower anthers with spiny lobes.

**** *Calyx 5-fid.*



1343 *Antirrhinum* Cal 5-leaved Cor. not spurred, gibbous at base: the upper lip bifid, reflexed, lower trifid, closed by the prominent palate Caps oblique at base, without valves, opening at the end by three pores.
1344 *Linaria* Cal 5-parted, with the two lower segments remote Cor spurred, ringent the orifice closed by the prominent palate Caps ovate 2-valved, opening at the end into 3-5-segments
1345 *Anarrhinum* Cal 5-leaved Cor prominent at base, honey bearing. lower lip flat, without a prominent palate Caps 2-celled, many-valved
1346. *Nemesia* Cal. 5-parted Cor spurred, with a prominent palate. Caps. compressed, truncate, opening lengthwise in the middle, 2-celled, 2-valved Seeds numerous, linear
1347 *Maurandya* Cal 5-parted Cor campanulate, unequal Filaments callous at base. Caps. 2, united, half 5-valved at end.
1348 *Gerardia.* Cal. 5-fid Cor 2-lipped, the lower lip 3-parted, with emarginate lobes: the middle 2-parted Capsule 3-celled, splitting
1349 *Pedicularis* Cal 5-fid Cor ringent Capsule 2-celled, mucronate, oblique. Seeds truncated. Leaves multifid.
1350 *Erinus* Cal 5-leaved Cor with a 5-fid, equal limb Lobes emarginate: the upper lip very short, reflexed Caps 2-celled
1351. *Mimulus* Cal prismatical, 5-toothed. Cor ringent, with the upper lip folded back at the sides. Stigma thick Capsule 2-celled, many-seeded

1352. *Hornemannia.* Cal. tubular, 5-toothed, plaited. Cor with the upper lip emarginate lower 3-lobed. Seeds minute, scurfy.
1353 *Mazus* Cal large, campanulate, spreading Cor ringent, with a pimpled throat Anthers connected. Stigma spatulate. Caps 2-celled, many-seeded
1354 *Isoplexis* Like Digitalis, but corolla campanulate, with the upper segment as long as the lip, and incumbent upon it before expansion
1355 *Digitalis* Cal 5-parted Corolla campanulate, ventricose, 5-fid Capsule ovate 2-celled
1356 *Scrophularia* Cal. 5-fid Cor subglobose, resupinate Caps 2-celled
1357. *Vandellia* Cal 4-fid Cor ringent Two outer filaments from the disk of the lip of cor. Anthers united in pairs Caps 1-celled, many-seeded
1358 *Sibthorpia* Cal 5-parted Cor 5-parted, equal. Stamens in remote pairs Caps. orbicular, compressed, 2 celled, with a transverse dissepiment
1359 *Limosella* Cal 5-fid Cor 5-fid, equal. Stamens approximating in pairs. Caps 1-celled, 2-valved, many-seeded
1360 *Browallia* Cal 5-toothed Cor closed by the prominent orifice Two of the anthers larger than the others Caps 1-celled
1361. *Stemodia* Cal 5-parted Cor 2-lipped Stamens 4. each filament bifid, and bearing two anthers. Capsule 2-celled
1362 *Trevirana* Cal 5-leaved. Cor declinate funnel-shaped. Limb flat, 5-parted, nearly equal Caps. half 2-celled
1363 *Columnea* Cal 5-parted, spreading Corolla ringent the upper lip 3-parted, with the intermediate segment arched, above the base gibbous Capsule berried, 1-2-celled
1364 *Russelia* Cal 5-leaved Cor 2-lipped, with a hairy throat upper lip broader, emarginate, lower trifid, with linear segments Stigma globose Caps 1-celled, 2-valved, many seeded.
1365 *Dodartia* Cal campanulate, angular, 5-toothed Lower lip of cor broad, 3-fid. Stigma bifid Caps globose, 2-celled, covered by the calyx

History, Use, Propagation, Culture,

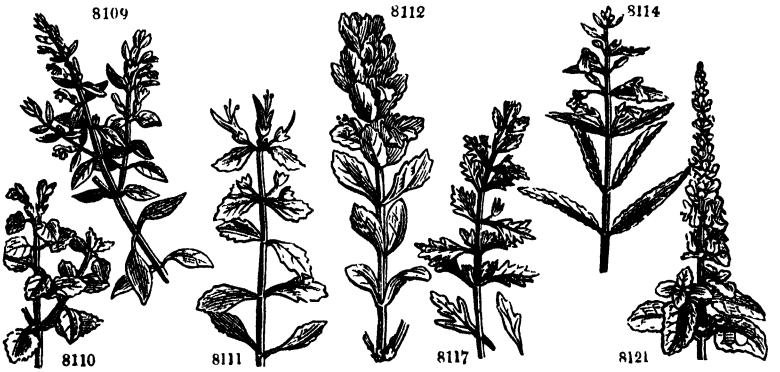
1242. *Ajuga.* Said to be an alteration of *abigo*, to expel or drive away The Latins attributed emmenagogue qualities to a plant called *ajuga*, which is believed to be our Teucrium chamæpitys Handsome flowering plants A reptans is vulgarly reputed vulnerary, cooling, and gently astringent It is commonly called *bugle*, which appears to be a corruption of *bugula*, a contracted diminutive of *buglossum*, which the plant resembles in medical qualities.
1243. *Anisomeles.* So named by Mr Brown, from *α*, privative, *ἰσος*, equal, and *μελος*, a member. Tropical downy herbaceous plants Their leaves are crenated, flowers grow in whorls supported by minute bracteæ; the calyxes are glandular, and the corolla of all the species purple.
1244. *Teucrium* Teucer, the Trojan prince, is said by Pliny to have been the first to employ this plant

1366 *Lindernia.* Cal. 5-parted Cor. ringent: upper lip very short. Two lower stamens with a terminal tooth and lateral anther Capsule 1-celled.
1367 *Herpestis* Cal. 5-parted, unequal. 2 inner sepals smaller, covered by the others. Cor tubular, somewhat 2-lipped Stamens included Lobes of anthers spreading Stigma emarginate
1368 *Caprraria.* Cal. 5-parted Cor campanulate, 5-fid, acute Caps 2-valved, 2-celled, many-seeded.
1369 *Buchnera* Cal. absolutely 5-toothed Limb of corolla 5-fid, equal, with cordate lobes Capsule 2-celled
1370 *Manulea* Cal 5-parted Cor funnel-shaped Limb 5-parted, with subulate segments, the four upper large, connected Caps 2-celled, many-seeded
1371 *Angelonia* Cal. 5-parted, nearly equal Cor irregular, spreading, 2-lipped, with a short tube, and arched orifice upper lip 2-parted, lower much larger, 3-parted, with the middle segment slipper-shaped at base
1372 *Schizanthus* Cor irregular: the upper lip 5-fid, lower 3-parted. Two filaments sterile Capsule 2-celled
1373 *Besleria* Cal. 5-parted Cor tubular, gibbous on each side, with a 5-lobed unequal limb. Berry roundish, 1-celled, many-seeded Seeds midulant
1374 *Teedia* Cal 5-parted Cor hypocrateriform, 5-fid, blunt. Style short, persistent Berry 2-celled, many-seeded
1375 *Brunsfelsia* Cal 5-toothed, small Tube of cor very long, with a flat 5-lobed limb Capsule berried, 1-celled, many-seeded, with a very large receptacle.
1376 *Celsia* Cal. 5-parted Cor rotate Filaments bearded Capsule 2-celled
1377 *Alonsoa* Cal 5-parted Cor subrotate, resupinate, 5-fid, with the upper segment largest Stamens declinate Filaments smooth Anthers approximating, similar Capsule 2-celled
1378 *Anthocercis* Cal 5-fid Cor campanulate, regular Rudiment of a 5th filament Stigma capitate Caps 2-celled, 2-valved, many-seeded The inflexed edges of valves inserted in the placenta.

***** *Calyx multifid.*

1379 *Cymbaria.* Cal. 10-toothed Upper lip of cor bifid, lower trifid Capsule cordate, 2-celled

---



GYMNOSPERMIA.

8092 Leaves ovate, Cor pubescent resupinate
8093 Four-cornered pyramidal villous, Radical leaves very large
8094 Stem simple, Cauline leaves as long as radical leaves
8095 Radical leaves smaller than cauline leaves
8096 Stolones creeping

8097 Leaves trifid, Fl axillary solitary shorter than leaf, Stem diffuse
8098 Leaves linear toothed forwards, Flowers axillary solitary
8099 Leaves stalked subcordate ovate acuminate acutely crenate hairy, Thyrses axillary stalked

8100 Bractes filiform, Leaves lanceolate entire downwards
8101 Leaves ovate subcordate crenate, Whorls many-fl Bractes linear, Calyx hairy, Glands inconspicuous

8102 Leaves multifid, Flowers lateral solitary
8103 Leaves multifid linear, Raceme compound, Pedicels short
8104 Leaves multifid, Whorls halved
8105 Leaves trifid or 5-fid filiform, Flower stalked solitary opposite, Stem decumbent
8106 Leaves lanceolate trifid, Peduncle axillary 3-flowered
8107 Leaves lanceolate entire white beneath, Flowers solitary
8108 Leaves entire rhomboid acute villous downy beneath, Flowers solitary
8109 Leaves quite entire ovate acute stalked downy beneath, Flowers racemose one-sided
8110 Leaves oval toothed forwards, floral entire stalked, Whorls racemose, Stem much branched
8111 Leaves ovate toothed forwards, floral entire sessile, Whorls racemose, Stems branched

and Miscellaneous Particulars.

medicinally Under-shrubs or herbs of little beauty, but several of them aromatic The leaves and younger branches of T. marum (*Mar*, Arabic, signifying bitter), when recent, on being rubbed between the fingers, emit a volatile aromatic smell, which readily excites sneezing, but to the taste they are bitterish, accompanied with a sensation of heat and acrimony. Cats are very fond of these plants, and where there are few will destroy them.

T scorodonia (σκορδον, garlic, the smell of which this plant possesses) in Jersey is used as a substitute for hops, and the beer is said sooner to become clear than when hops are made use of Withering found on trial that it gave too much color to the liquor

T. scordium, also from σκορδον, garlic, was once in high esteem for destroying worms and for fomentations

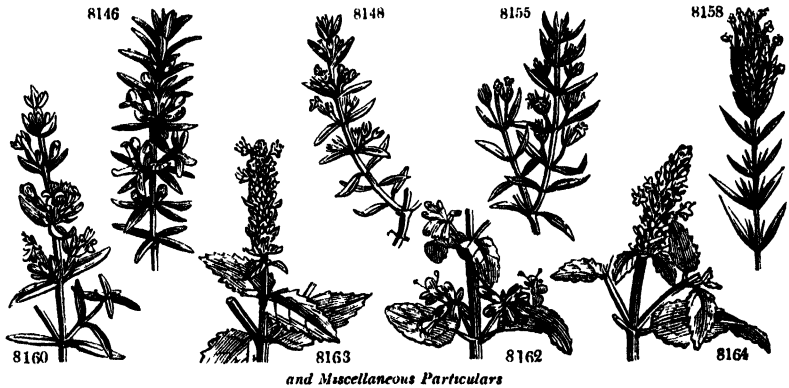
History, Use, Propagation, Culture,

Sheep and goats are said to eat this plant horses, cows, and swine to refuse it. If cows, compelled by hunger, eat it, their milk gets a garlic flavor

T. chamædrys, is said to have cured Charles V of the gout, by a vinous decoction taken for sixty successive days. It is commonly called Germander, which seems to be a corruption of the word Chamædrys, for the French call it *germandrée*, an evident alteration of *gamandré*, under which name it first appeared in the very rare Herbier de Mayence, printed in 1485

1245. *Westringia.* Named by Sir J E Smith, in honor of Dr John Peter Westring, physician to the king of Sweden, and author of several learned papers on the Lichen tribe A genus of New Holland plants, chiefly from the colder parts of that country, and having the appearance of our Rosemary.



8112 Leaves ovate-oblong villous nearly entire, Flowers axillary solitary sessile
8113 Leaves ovate serrate smooth, Pedunc. sol. 3-flowered · intermediate sessile, Bractes linear lanceolate
8114 Leaves lanceolate repand-serrate rectangular at base, Fl. racemose one-sided, Calyx 2-lipped
8115 Leaves lanceolate crenate rugose, Flower racemose one-sided, Calyx 2-lipped
8116 Leaves ovate serrate, Raceme spiked round sessile terminal
8117 Leaves cuncate serrate cut smooth narrowed into the stalk, Flower solitary stalked
8118 Leaves ovate-lanceolate serrate hoary beneath, Stem erect round terminal, Whorls 6-leaved
8119 Leaves ovate unequally serrate, Racemes terminal, Bractes shorter than flower-stalk
8120 Leaves oblong acuminate unequally serrate pubescent, Spikes sessile terminal, Cal inflated villous
8121 Leaves cordate oblong obtuse, Stem brachiate dichotomous, Spikes very long terminal sessile spiral
8122 Leaves cordate toothed acuminate, Racemes lateral nodding
8123 Leaves cordate subpubescent toothed stalked, Racemes axillary one-sided, Stem erect herbaceous
8124 Leaves lanceolate crenate tomentose hoary beneath, Racemes terminal, Flower stem brachiate
8125 Leaves cuneiform lanc. serrated villous, Racemes axillary and terminal, Cor resupinate
8126 Leaves ovate rugose cut crenate hoary, Stems erect, Racemes straight one-sided
8127 Leaves oblong sessile toothed nearly naked, Fl axillary stalked in pairs, Stem diffuse pubescent
8128 Leaves cuneiform ovate cut crenate stalked, Fl ternary, Stems procumbent somewhat hairy
8129 Leaves elliptical crenate, Fl lateral solitary, Lip of cor woolly outside, Leaves various in form
8130 Leaves ovate cut serrate smooth, Whorls halved, Stems erect smooth
8131 Leaves ovate crenate floral entire, Whorls halved racemose, Stem bearded in two rows
8132 Corymbs terminal, Cal with acute unarmed teeth, Leaves lanceolate entire downy beneath
8133 Corymbs terminal, Cal. with acute mucronate teeth, Lvs linear entire revolute at edge downy beneath
8134 Heads terminal few-flowered, Leaves stalked ovate blunt downy beneath, Stem procumbent
8135 Corymbs terminal, Leaves cuneiform orbicular crenate hairy
8136 Corymbs terminal hairy, Leaves ovate serrate and stems densely woolly at the ends yellow and shining
8137 Heads roundish stalked, Leaves lanceolate blunt crenate revolute at edge downy, Stem decumbent
8138 Heads roundish, and leaves, which are linear lanceolate crenate forwards, tomentose yellow at end
8139 Fl solitary clustered, Leaves linear revolute crenate, Calyxes woolly
8140 Heads roundish lax, Leaves lanceolate crenate forwards downy hoary, Stem woolly corymbose
8141 Heads stalked, Leaves lanceolate crenate tomentose, Stem erect
8142 Heads roundish, Leaves linear revolute crenate forwards close and stem densely woolly
8143 Heads terminal sessile, Leaves linear revol at edge packed in four close rows, Stem procumbent downy
8144 Spiny, Upper lip of calyx ovate, Corolla resupinate, Peduncles twin
8145 Leaves entire ovate acute stalked revolute at edge pubescent downy beneath, Fl racemose

8146 Leaves beneath and calyxes silvery, Teeth half as long again as tube
8147 Leaves beneath and calyxes ash-colored opaque, Teeth half as short as tube

8148 Whorls fastigiate, Leaves linear lanceolate rough
8149 Lvs acute revolute at edge pubescent, Pedunc axillary many-fl Bractes much shorter than calyx
8150 Whorls roundish hispid, Leaves obovate oblong acuminate veinless dotted hispid
8151 Pedunc axillary 3-6-flowered, Bractes shorter than calyx, Leaves ovate hispid veiny beneath
8152 Pedunc axillary cymose one-sided, Sepals acuminate mucronate, Leaves lin lanc entire mucronate
8153 Stem erect branched with spreading hairs, Upper leaves hairy acute, Ped 1-flowered axillary
8154 Ped axill cymose one-sided, Sepals blunt unarmed, Lvs roundish ovate atten at base toothed bluntish
8155 Pedunc axillary cymose, Leaves lanceolate entire, Stem brachiate
8156 Flowers spiked, Leaves keeled dotted ciliated
8157 Fl axillary 3 subsessile, Bractes linear, Leaves oblong entire attenuate at base smooth hispid beneath

8158 Flowers spiked, Bractes heaped linear ciliate
8159 Flowers whorled, Leaves linear lanceolate entire

8160 Fl. whorled racemose 1-sided, Middle lobe of cor 2-lobed entire, Leaves lanceolate, Teeth of calyx erect
8161 Fl whorled racemose 1-sided, Midd lobe of cor 2-lobed entire, Lvs lin lanc Teeth of cal spreading uneq
8162 Pedunc axillary cymose, Cor resupinate, Middle lobe crenate, Leaves oblong cordate toothed [tooth
8163 Spikes whorled cylind Midd lobe of cor crenate, Style shorter than cor Lvs subcord ov acum sharply
8164 Spikes whorl cylind Midd lobe of cor crenate, Style longer than cor Lvs cord -ov acum bluntly tooth

and Miscellaneous Particulars

1246. *Satureja.* The Arabs call all labiate plants by the collective name of *ss'atar*, according to Bochart. Forskahl says, they call the wild Thyme *ss'atar* S. montana and hortensis have been cultivated as culinary aromatics from time immemorial, and much more formerly than now, when almost all European species are superseded by those of the East Indies

1247. *Thymbra.* A name of uncertain origin The ancients gave it to a plant analogous to Thyme. Possibly it may have been so called after the name of a place Thymbræa, a town in Lydia, was the spot where the famous battle was fought between Cyrus and Crœsus, in which the fate of the latter was decided

1248 *Hyssopus* Latinized from the Hebrew name *ezob* The Arabic name *azzaf*, is evidently the same.

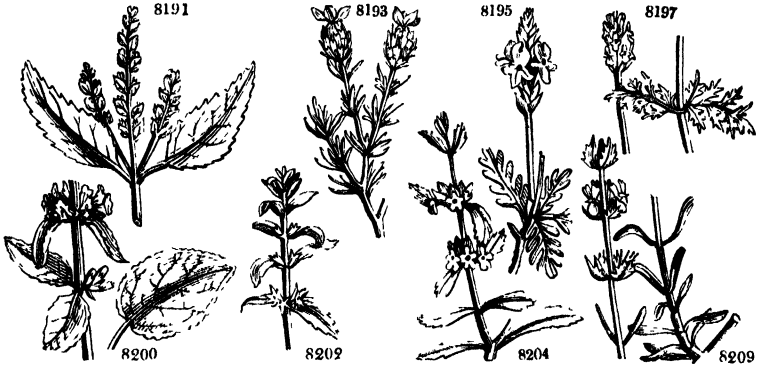
History, Use, Propagation, Culture,

Vide John de Souza, p 106 The plant to which this name was given is involved in uncertainty. It appears to have been one of the smallest plants, whence some have inferred that "the Hyssop which groweth out of the wall" is a kind of moss H officinalis, a neat little evergeen tuft, and most ornamental and fragrant when in flower, was once in considerable repute as a popular medicine, but is now almost out of use

1249 *Nepeta* Said by Linnæus to be derived from *Nepet*, a town of Tuscany, mentioned by Pliny N cataria is called catmint, because cats are very fond of it, especially when it is withered, when they will roll themselves on it, tear it to pieces, and chew it with great pleasure Ray observes, that plants which he transplanted from the fields into his garden were always destroyed by the cats, unless he protected them with thorns till they had taken good root and came into flower, but that they never meddled with plants raised from seed. Miller has confirmed this by his own experience, having frequently set a plant from another part of the garden within two feet of others which came up from seeds, when the former was torn in pieces and destroyed by the cats, whilst the latter remained unhurt The true reason of this difference is assigned by Ray, that the cat is fond of it in a languid withering state, or when the peculiar scent of the plant is excited by being handled or bruised in gathering or transplanting Hence the English vulgar saying,



8165 Flowers spiked, Whorls somewhat stalked, Leaves stalked cordate tooth-serrated
8166 Corymbs stalked spiked, Leaves lanceolate rugose tomentose bluntly serrated
8167 Spike whorled interrupted, Leaves cordate toothed rugose waved crisp stalked hoary
8168 Cymes stalked many-flowered, Leaves lanceolate oblong cordate naked, Lateral lobes of cor reflexed
8169 Cymes stalked many-fl hairy, Lvs oblong cordate villous subsessile, Lateral lobes of cor reflexed
8170 Cymes stalked many-fl pilose, Leaves cordate stalked naked subsessile, Lateral lobes of cor spreading
8171 Cymes remote stalked 1-sided few-fl Lvs cordate blunt crenate glandular beneath floral all sessile
8172 Cymes stalk. 1-sid: lower rem Lvs cord blunt cren rug downy without glands floral generally stalked
8173 Cymes stalked many-flowered, Leaves stalked oblong subcordate crenate downy
8174 Flowers panicled, Leaves lanceolate serrate sessile naked
8175 Cymes stalked, Leaves cordate oblong lanceolate deeply serrate downy
8176 Leaves cordate oblong serrated, Bractes linear, Whorls 8-12-flowered incurved nearly 1-sided
8177 Racemes whorled naked, Leaves cordate oblong sessile naked
8178 Flowers sessile in whorled spikes, Bractes lan. longer than calyx pubesc Leaves stalked villous beneath
8179 Cymes stalked racemose, Leaves obl cordate serrate beneath hoary and rugose with veins
8180 Leaves cordate oblong crenate stalked, Stem smooth angular, Flowers whorled capitate clustered
8181 Fl sessile in whorled spikes, Bractes lin the length of calyx, Leaves stalked
8182 Fl sessile in whorled spikes, Whorls distant capitate, Bractes lanc length of cal Leaves stalked entire
8183 Leaves sessile lanceolate in approximated whorls, Bractes ovate with netted veins [at end
8184 Cymes stalked many-fl Tube of cor filiform curved, Leaves ovate cordate blunt stalked serr pubescent
8185 Cymes stalked few-fl racemose, Leaves ovate cordate blunt stalked toothed pubescent
8186 Spikes term Bractes obl. acum nerved with colored lines, Lvs cord pubesc Lateral lobes of cor reflexed
8187 Spikes term, Bractes ov nerved rugose subscariose, Lvs obl cord. villous, Lateral lobes of cor spreading
8188 Flowers spiked, Leaves pinnatifid entire
8189 Flowers spiked, Lateral lobes of cor spreading, Leaves pinnatifid with lin nearly equal segments

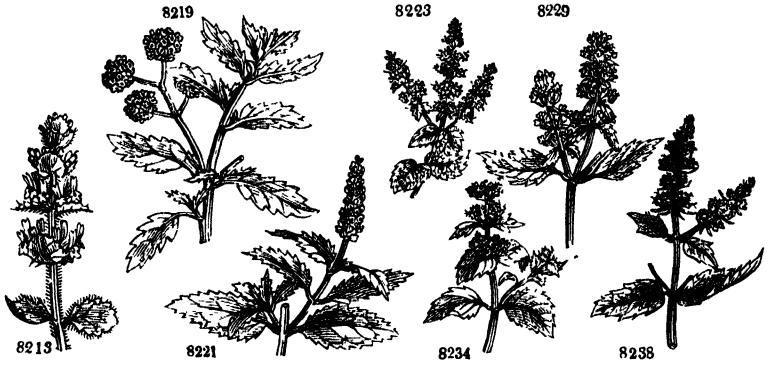
8190 Stems prostrate, Leaves ovate subserrate, Spikes terminal, Calyx scarious at end
8191 Spikes solitary unilateral erect, Bractes veiny

8192 Leaves sessile lin lanc revolute at edge, Spike interrupted naked

8193 Leaves sessile lin downy revolute at edge, Spike contracted comose subsessile, Bractes 3-lobed
8194 Leaves sessile lin rugose villous revolute at edge, Spike comose, Bractes undivided
8195 Leaves sessile linear pectinate-pinnate, Spike contracted comose
8196 Lvs stalked pinnate, Leaflets cuneate, Spike imbricated
8197 Lvs stalked hoary, Leafl. pinnatifid crosswise, Spike simple 4-corn spiral, Bractes ovate nerved villous
8198 Lvs. stalked pinnate nearly smooth, Leafl pinnatifid crosswise, Spike branched interrupted 4-cornered
8199 Lvs stalked ovate cordate serrate fleshy, Spike 4-cornered, Calyxes recurved

8200 Shrubby villous, Lvs cordate oblong acute stalked, Spikes whorled before flowering nodding
8201 Shrubby downy, Lvs ovate lanc cordate narrowed at end white beneath, Whorls about 8-fl remote
8202 Herbaceous without bractes, Cal larger than cor spiny, Upper lip trifid
8203 Herbaceous without bractes villous, Stem diffuse, Segm of calyx nearly equal spiny
8204 Herbaceous decumbent without bractes, Leaves spatulate toothed at end, Cal spiny, Upper lip ovate
8205 Half-shrubby woolly, Leaves lanc nearly entire, Fl in whorled spikes, Bractes cordate acute downy
8206 Half-shrubby downy, Lvs. lanc cren Fl in whorled spikes, Bractes cord acum reticulated with nerves
8207 Herbac pilose-hispid, Upper lvs lanc amplexicaul toothletted, Bractes cord acum netted hairy at edge
8208 Half-shrubby downy, Lvs linear lanceolate nearly entire, Flowers and bractes toothed
8209 Hirsute, Lvs lanc spiny toothed, Bractes round cord shorter than cal with spiny teeth, Whorls distant
8210 Hirsute, Lvs lanc spiny toothed, Bractes cord acum longer than cal with spiny teeth, Whorls close
8211 Lvs lanc smooth entire, Bractes cord toothed-spiny, Calyxes equal
8212 Leaves lanc toothed smooth above, downy beneath, Bractes ovate toothed spiny, Calyxes equal

and Miscellaneous Particulars



"*If you set it*
The cats will eat it,
If you sow it
The oats will not know it."

1250 *Elsholtzia* Named by Willdenow, in memory of a Prussian botanist, John Sigismund Elsholtz, who lived in the middle of the seventeenth century Inconspicuous hardy herbaceous plants of little merit

1251 *Lavandula* From *lavare*, to wash The use of the distilled water of this plant is well known. The flowers of L spica have an agreeable fragrant odour, and warm bitterish taste Alcohol extracts their virtues completely, and elevates in distillation all their odorous parts, water acts less completely The oil, however, on which their virtues depend, is obtained separate in distillation with water, in the proportion, according to Lewis, of one ounce of oil from sixty ounces of the flowers Lavender is stimulant and tonic The oil extracted by alcohol enters into several compositions The dried leaves in powder were used formerly as a sternutatory, but they are now neglected The flowers are cut in dry weather, when they begin to blow. (*London Dispensatory*, 862)

1252 *Sideritis* From σίδηρος, iron A name given by the Greeks to a plant by which were cured all

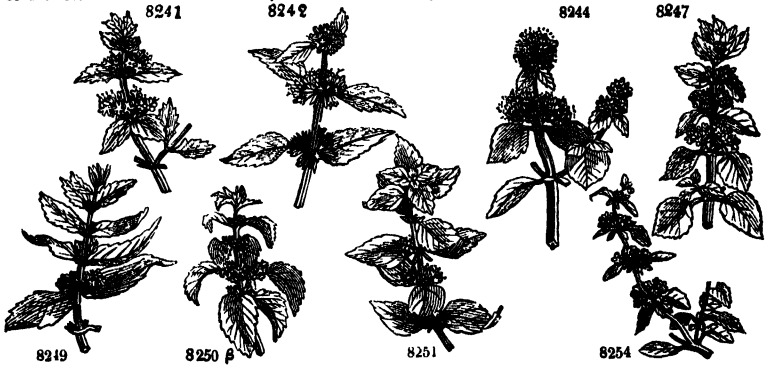
History, Use, Propagation, Culture,

wounds by sword The plants of the moderns do not possess any such properties Their flowers, however, have frequently a ferruginous color

1253 *Bystropogon.* A name elegantly contrived by L'Heritier, from βυω, to close, and πωγων, a beard, in allusion to the throat of the corolla being closed by hairs.

1254. *Mentha* Μινθα or μινθη, in old Greek. The poets feign that Mintha was a daughter of Cocytus, transformed into the plant which bears her name, an allegorical description of the terrible effects ascribed to their plant by the ancients M viridis not being so hot to the taste as peppermint, and having a more agreeable flavor than most of the others, is generally preferred for culinary and some medicinal purposes The leaves or tops are used in spring salads, and eaten dried as sauce with lamb and in soups.

The medical preparations of spearmint are more pleasant than those of peppermint, but perhaps less efficacious. This herb, as do the other sorts, contains much essential oil, but of an odor less agreeable than that of lavender or marjoram. it is therefore less employed as a cephalic, but it acts very powerfully on parts to which it is immediately applied, and therefore considerably on the stomach It acts especially as an antispasmodic, and therefore relieves pains and cholic arising from spasm It will also stop vomiting dependent on the same cause; but if it arise from an inflammatory irritation in the stomach itself, or in other parts of the body, it aggravates the disease The infusion of mint in warm water agrees better with the stomach than the distilled water. The officinal preparations are an essential oil, a conserve, a simple water, and a spirit The conserve is very grateful, and the distilled waters both simple and spirituous, are generally thought pleasant.



8213 Leaves lanc toothed blunt pilose, Bractes toothed spiny, Stems hirsute decumbent
8214 Hirsute, Lvs obl cuneate toothed wavy downy beneath, Bractes round with spiny teeth, Whorls distant
8215 Shrubby downy, Lvs cord obl crenate stalked downy on each side, Upper lip of cor ovate entire
8216 Like hyssopifolia, but leaves smooth on each side somewhat toothed lanceolate blunt

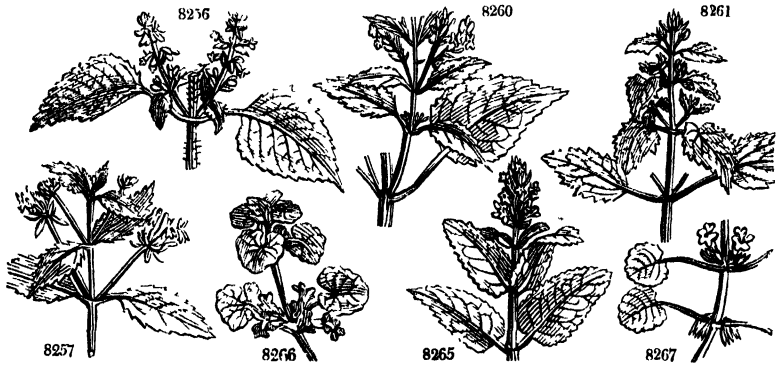
8217 Panicle dichotomous, Cal feathery, Leaves ovate subserrate downy beneath
8218 Panicle dichotomous, Cal feathery, Leaves ovate entire very white beneath
8219 Panicle dichotomous, Flowers capitate, Leaves ovate crenate most villous beneath
8220 Panicle dichotomous, Flowers capitate, Leaves ovate toothed smooth dotted

8221 Spikes oblong, Leaves oblong serrated hairy sessile, Stamens longer than cor.
8222 Spikes cylindr interrupted, Leaves ovate-obl subsessile remotely serrate and calyxes smooth
8223 Hoary, Spikes oblong interrupted, Leaves roundish rugose crenate sessile

8224 Spikes obl Leaves sessile oval finely and equally serrate acum hoary beneath, Stamens as long as cor
8225 Spikes obl. Lvs ovate stalked serr hoary beneath, Calyxes and peduncles hirsute, Stem much branched
8226 Leaves stalked subcordate slightly pubescent, Spikes middle sized [somewhat hairy
8227 Spikes cylindr interrupted, Lvs lanc. subsess cun at base finely serrated smth on each side, Teeth of cal
8228 Spks. obl Lvs obl comp blunt serrat ses hoary and downy on each side, Cal and ped vill Stem much br
8229 Spikes obl blunt interrupted at base, Lvs ov -obl acute serrat stalked smooth, Cal. quite smooth at base
8230 Flowers racemose whorled, Leaves stalked ovate lanc serrated smooth
8231 Spikes capitate, Leaves cordate cut-toothed wavy sessile, Stamens length of corolla [hirsute
8232 Spikes cylindr interrupt Lvs ov obl subsess cuspid ser waved complicate hoary on each side, Cal and ped.
8233 Spikes cylindr Lvs ovate obl subsess cuspidate serr wavy complicate hoary on each side
8234 Flowers in heads, Lvs ellipt. blunt serrated smooth stalked, Stamens shorter than corolla [at base
8235 Spikes cylindr interrupted, Lvs ovate lanc stalked finely serr entire at base, Ped hirsute, Cal smooth
8236 Spikes obl interrupt at base, Lvs obl lanc subses remotely and finely serrat entire at base hoary beneath
8237 Spikes cylindr contracted, Leaves obl subcor subses equally serrated hoary beneath, Cal and ped hirsute
8238 Spks cylindr interrupt at base, Lvs ov obl subsess finely and unequally serr hoary, Cal and ped hirsute
8239 Spikes cylindr. interrupted, Lvs. ovate-ellipt rounded at end serrated subsessile hoary beneath [calyx villous
8240 Spks cylindr interrupt at base, Lvs lin lanc nearly entire complicate sess hoary on each side, Ped and
8241 Flowers whorled, Lvs ovate stalked serrated entire at base smooth, Teeth of calyx hairy
8242 Fls whorl. Lvs ov -lanc narrowed at each end, Cal tubul ir obl hairy, Hairs of pedicels spreading, of stems
8243 Low pubesc Fl whorled, Lvs stalked with resinous dots acute at each end, Stamens exserted [deflexed
8244 Flowers capitate or whorled, Lvs stalked ovate, Calyx hairy on each side, Pedicels hispid backwards
8245 Whorls spiked oblong, Leaves lanceolate entire downy
8246 Fl whorled, Lvs ovate stalked serrate hairy, Cal hairy, Ped. smooth, Stem erect
8247 Flowers whorled, Lvs ovate acutish serrated, Stamens longer than corolla
8248 Spikes cylindr interrupted at base, Lvs ovate stalked serrate beneath hairy, Cal and peduncle hirsute
8249 Flowers whorled, Lvs lanc subsess Stem much branched erect, Cal at base and pedicels very smooth
8250 Flowers whorled, Lvs ovate stalked serrate hairy, Cal and peduncles hirsute, Stem much branched

8251 Flowers whorled, Lvs. ovate, Stem much branched spreading, Calyxes and pedicels smooth at base
8252 Flowers whorled, Lvs lanc serrate stalked hairy, Stam as long as corolla
8253 Flowers whorled, Lvs ov subsess cuspidate serr wavy nearly smooth, Pedunc and calyx smooth at base
8254 Flowers whorled, Lvs ovate, Stem prostrate, Pedicels and cal downy on each side, Teeth ciliated
8255 Flowers whorled. Lvs lanc nearly entire sessile smooth, Bractes palmate

and Miscellaneous Particulars.



Lewis observes, that mint is said to prevent the coagulation of milk, and hence it has been recommended to be used with milk diets, and even in cataplasms and fomentations for resolving coagulated milk in the breasts: upon experiment, the curd of milk, digested in a strong infusion of mint, could not be perceived to be any otherwise affected than by common water, but milk, in which mint leaves were set to macerate, did not coagulate near so soon as an equal quantity of the same milk kept by itself Dry mint digested in rectified spirits of wine, gives out a tincture which appears by day-light of a fine dark green, but by candle-light of a bright red color The fact is, that a small quantity of this tincture is green, either by day-light or candle-light, but a large quantity seems impervious to common day-light, however, when held between the eye and a candle, or between the eye and the sun, it appears red, so that if put into a flat bottle it appears green, but when viewed edgewise red

For medicinal use spearmint is generally cut just as the flowers appear, but for obtaining the essential oil, the flowering plant is preferred It should be cut in very dry weather. (*London Dispensatory*, 384.)

M piperita has a more penetrating smell than any of the other species, and a much stronger taste, pungent and glowing like pepper, sinking as it where into the tongue, and followed by a sensation of coldness Its stomachic, anti-spasmodic and carminative qualities render it useful in flatulent colics, hysterical affections, retchings, and other dyspeptic symptoms, acting as a cordial, and often producing immediate relief. The officinal preparations are an essential oil, a simple water, and a spirit The essence of peppermint is an elegant medicine, and seems to be the rectified oil dissolved in spirits of wine.

"The cultivators of the plant observe, that to keep up its quality, the roots must be transplanted every three

History, Use, Propagation, Culture,

years, otherwise it degenerates into the flavor of spearmint" (*Linnean Transactions*, v 176) If the plant be cut in wet weather it changes to black, and is little worth (*London Dispensatory*, 385)

M. pulegium (from *pulex*, a louse, which animal it was thought to drive away) smells like spearmint, but less fragrant, the taste aromatic and pungent, with a slight flavor of camphor These qualities reside in a very volatile essential oil, which rises in distillation with water It was formerly regarded as emmenagogue, expectorant, and diaphoretic, and was in repute for promoting the uterine evacuation, and relieving hysteria, hooping-cough, asthma, but it is now justly considered of no value, and seldom used in regular practice (*London Dispensatory*, 386)

1255 *Perilla* A name the meaning of which has not been explained An annual plant with a strong balmy fragrance

1256 *Hyptis* From ὑπτιος, reversed, because the corolla seems inverted, both as to its form and as to the insertion of stamens. Plants with densely whorled flowers, all natives of the western parts of the world, within, or nearly so, the limits of the tropics

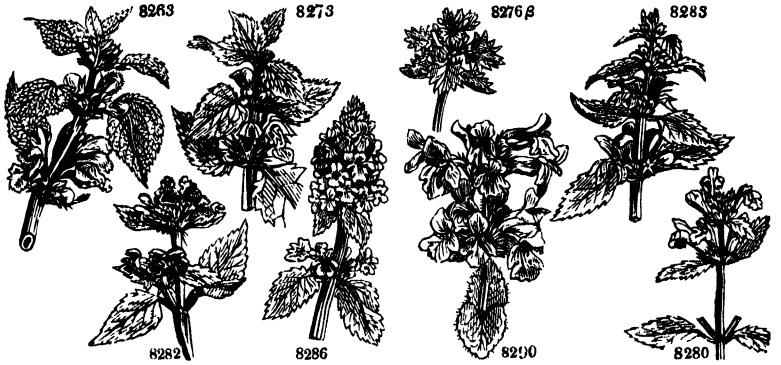
1257 *Horminum* From ὁρμαω, to excite, in allusion to its stimulant qualities The Horminum of the ancients was reputed aphrodisiac

1258 *Glechoma* Γληχων was a sort of Thyme among the Greeks Small trailing herbs The leaves of G hederacea are often deformed with red hairy tumours, which are the galls of the Cynips Glechomæ Before

8256 Leaves ovate serrate, Bractes long leafy

8257 Heads stalked in an involucre, Involucre the length of flowers, Leaves ovate toothed
8258 Heads stalked in an involucre, Involucre longer than flowers, Leaves oblong toothed narrowed at base
8259 Heads opp few-fl without bractes, Peduncle shorter than joints, Leaves cord doubly serrate, upper oval
8260 Flowers in spiked 1-sided panicles on a two-parted peduncle, Leaves ovate
8261 Flowers in stalked capitate cymes, Leaves of involucre 2 longer than calyx in fruit, Leaves oblong
8262 Leaves ovate subcordate attenuate acutely crenate pubescent spiked whorled terminal, Cal 5-toothed
8263 Flowers capitate, Involucre filiform hispid shorter than calyx of fruit, Lower leaves cordate
8264 Heads on a short peduncle, Leaves of involucre oblong lanc. Cal pubescent not closed with hairs

8265 Stem leafy, Leaves ovate oblong crenate, Bractes cordate, acuminate, Cal pungent



8266 Smooth, Segment of calyx ovate acute
8267 Hirsute, Segment of calyx lanceolate cuspidate

8268 Leaves cord unequally finely serr Orifice of cor inflated, Lower lip 3-toothed on each side, Cal colored
8269 Leaves cord rugose, Stem smooth, Cal smooth the length of tube of corolla
8270 Leaves cord acute rugose and stems hairy, Whorls many-flowered, Tooth of orifice solitary setaceous
8271 Leaves cord concave somewhat hoary, Orifice of cor inflated. Tube straight with two teeth on each side
8272 Leaves cord acuminate, Whorls 10-flowered
8273 Leaves cord acuminate serrate stalked, Whorls 20-flowered
8274 Smooth, Leaves cordate crenate floral subsessile, Teeth of calyx as long as cor
8275 Leaves stalked somewhat toothed lower cordate, upper ovate
8276 Leaves stalked cordate blunt toothed, upper close together, Stem naked below
β Leaves cut-toothed
8277 Floral leaves sessile amplexicaul cut, radical lobed
8278 Leaves many-parted

8279 Joints of stem equal, All the whorls remote, Leaves lanceolate
8280 Joints of stem equal, Leaves ovate lanceolate serrate villous, Helmet crenate cut
8281 Joints of stem thickened upwards, Upper whorls contiguous, Cal pungent, Cor little longer than calyx
8282 Stem hispid, Joints thickened upwards, Cor thrice as long as calyx, Helmet ventricose

8283 All the leaves ovate, Involucre 4-leaved

8284 Spike interrupted, Helmet entire, Middle segm of lower lip emarg Cal smoothish
8285 Spike oblong, Helmet entire, Middle segm of lower lip crenate wavy, Cal hairy, Bractes ciliated
8286 Spike interrupted, Helmet bifid, Middle segm of lower lip crenate, Tube downy incurved
8287 Spike entire, Middle segm of lower lip entire
8288 Spike leafy at base, Helmet bifid
8289 Spike leafy at base, Helmet entire
8290 Spike leafy interrupted, Calyx villous at edge, Teeth subulate, Helmet obcordate

and Miscellaneous Particulars

the use of hops, the leaves were put in ale, and being bitter, aromatic, and having a peculiar and very strong smell, were much used in popular medicine It is now, however, seldom used

1259 *Lamium Lamia* was a celebrated marine monster, the flowers of this genus have a considerable resemblance to the grotesque figure of some beast L. orvala is the only species admitted into the garden The others are mostly ugly weeds L. album, *Ortie blanche*, Fr, *Taube Nessel*, Ger, and *Ortica morta* or *bianca*, Ital, has a disagreeable smell when bruised, and though no cattle whatever will touch it, yet Linnæus says, the leaves are eaten in Sweden as a pot herb in spring

1260. *Galeopsis* From γαλη, a weasel, and ὀψις, appearance. The flower has a grotesque figure, and may be likened to the form of a weasel, or, indeed, of any thing else

1261 *Galeobdolon* A word with the same meaning as Galeopsis, which see.

1262 *Betonica* In Celtic botany is called *Bentonic*, wherefore it appears, that Pliny gave too much way to conjecture, when he wrote that Betonica or Vetonica was so called from the Vetones, a people who dwelt at the foot of the Pyrenees B officinalis was formerly much used in medicine, but it is discarded from modern practice. When fresh it intoxicates The leaves when dry excite sneezing Sheep eat it, but goats refuse it. The roots are bitter and very nauseous, in a small dose they vomit and purge violently This plant dyes wool of a very fine dark yellow color

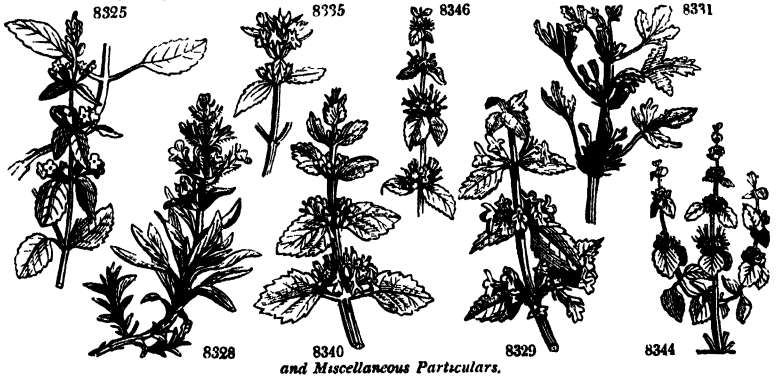
History, Use, Propagation, Culture,

1263. *Stachys* From στάχυς, a spike, the flowers of all the species grow in spikes They are for the most part strong smelling weeds

1264 *Zietenia.* A genus divided by Gleditsch from Stachys, on account of the different structure of the corolla, and the single grain. It is a plant with lanceolate entire lineate leaves, the lower of which are connate, and purple blossoms.



8291 Whorls 6-flowered, Leaves cordate stalked
8292 Leaves ovate obl acum serrated hairy above with soft down beneath, Segm. of cal linear mucronate
8293 Whorls spiked 6-fl Tube of cal shorter than spread teeth, Helm. of cor. emarg. Lvs ov serr with soft down
8294 Small, Stems much branched diffuse, Leaves cordate crenate, Cal campanulate spiny
8295 Whorls about 6-flowered, Leaves linear lanceolate ½ stem-clasping sessile
8296 Whorls 6-flowered, Leaves ovate cordate crenate, Petioles dilated
8297 Leaves cordate cren pubescent, Whorls 4-6-flowered, Stem erect smooth simple
8298 Whorls many-fl approximated, Bractes filiform, Leaves cordate toothed, Stem decumbent villous
8299 Hoary, Whorls many-fl. Leaves ovate, Serratures imbricated, Stem woolly
8300 Whorls many-fl Calyxes subpungent, Leaves oblong subcordate crenate, Stem woolly
8301 Whorls many-fl Leaves woolly oblong, Stems procumbent at base and rooting
8302 Whorls 10-fl Calyxes unarmed, Leaves cordate. floral ovate entire sessile, Stem hairy
8303 Whorls 6-fl Leaves oblong cordate stalked, Stem hollow
8304 Whorls 2-fl Leaves linear naked, lower pinnatifid-toothed
8305 Like S germanica, but downy not woolly, Leaves narrower, Calyxes long spiny
8306 Whorls many-fl. Leaves cordate thin, Serratures cartilaginous at end, Lips of cor. flat
8307 Whorls spiked 6-flowered, Bractes cordate, Leaves cordate stalked blunt crenate toothed
8308 Leaves ovate crenate pubescent upper entire, Whorls 6-fl Cal hairy with filiform segments
8309 Whorls spiked, Lvs oblong attenuated at base serrated hairy · lower blunt, Cal mucronate spiny
8310 Erect pubescent, Leaves cord. ov. toothed above smooth, beneath white with down, Whorls about 6-fl.
8311 Whorls a little spiked hairy 6-fl Cal spiny, Leaves oblong serrate blunt, Helmet bifid
8312 Hairy, Whorls 30-flowered, Calyx pungent, Stem hairy
8313 Smooth much branched, Branches spiny, Pedunc axillary solitary 1-fl with two bractes
8314 Hoary, Branches brachiate terminated by a spine, Flowers axillary in threes
8315 Leaves downy ovate lanceolate floral shorter than the whorl
8316 Whorls 6-flowered, Radical leaves oval crenate upper ovate entire, Cor twice as long as calyx
8317 Leaves obliquely cordate rugose crenate blunt hairy, Bractes entire shorter than calyx
8318 Leaves cordate ellipt the lower on long stalks, Stems and spinulose calyxes covered with wool
8319 Whorls 2-flowered, Leaves cordate deeply serrated rugose, Tube of cor curved
8320 Whorls 6-flowered, Stems prostrate, Upper lip of cor bifid spreading reflexed, Lvs broad cord crenate
8321 Hoary, Whorls 6-fl Leaves linear lanceolate narrowed at base downy rugose serrated, Calyxes pointless
8322 Whorls 6-fl Calyxes rather pungent, Lvs cuneate lanceolate blunt serrate at end sessile, Stem decum.
8323 Whorls subspiked, Leaves cordate ellipt crenate rough, Stems ascending
8324 Whorls 6-fl Leaves ovate lanc rugose 3-nerved stalked, Stem erect
8325 Small, Whorls 6-fl Leaves blunt nearly naked, Corolla the length of calyx, Stem weak
8326 Whorls many-fl spiked, Upper lip bifid, with acute divisions, Leaves broad cordate rugose hairy
8327 Whorls 8-flowered, Leaves lanceolate cordate crenate rugose, Stem very hairy

8328 Whorls 6-flowered very hairy, Leaves lanceolate entire lined

8329 Leaves cordate undivided serrated, Cal acuminate
8330 Leaves cordate undivided serrated, Cal subtruncate
8331 Leaves palmate toothed, Stem woolly

8332 Leaves whorled halved 2-parted half-spiked

8333 Leaves cuneiform 5-toothed plaited, Whorls without involucrum
8334 Leaves elliptical obtuse crenate downy rugose, Calyxes and bractes lanceolate
8335 Leaves oblong hoary rugose toothed, the teeth towards the end largest, Cal with small subulate teeth
8336 Leaves lanceolate hoary rugose toothed at end, Cal with setaceous teeth, Stem branched divaricating
8337 Leaves ovate hoary bluntly toothed rugose, Cal with subulate teeth, Stem branched at base
8338 Leaves roundish subcordate crenate rugose, Cal with straight villous setaceous teeth
8339 Leaves cordate roundish emarginate crenate, Calyx 10-toothed spiny
8340 Leaves roundish ovate toothed rugose, Teeth of calyx 10 setaceous hooked
8341 Leaves cordate crenate downy green above, Teeth of calyx mucronate recurved
8342 Leaves cordate ovate crenate, Teeth of cal 10 spreading lanceolate, Bractes subulate
8343 Leaves roundish cordate unequally crenate, Limb of calyx spreading, Teeth ovate mucronate
8344 Leaves cordate roundish, crenate somewhat toothed, Teeth of calyx 10 unarmed
8345 Leaves ovate greenish deeply crenate, Teeth of calyx subulate smooth spreading
8346 Leaves cordate ovate crenate, Limb of calyx spreading, Teeth ovate mucronate, Bractes oblong
8347 Hoary, Limb of calyx flat villous, Leaves cordate concave, Stem shrubby
8348 Limb of calyx longer than tube membranous, Larger angles rounded

and Miscellaneous Particulars.

1265 *Ballota* So named on account of its offensive odor, from βαλλω, to reject.

1266. *Marrubium* According to Linnæus is derived from an ancient town of Italy called *Maria-urbs*, situated on the borders of the Fucine lake. M vulgare dried, has an aromatic odor, which, however, is soon lost by keeping, and a bitter taste. Both water and alcohol extract its virtues It is tonic, diu etic, and laxative, was formerly much used in pulmonary affections, and is still a popular remedy for asthma and obsti-

History, Use, Propagation, Culture,

nate coughs. It loosens the belly when taken in large doses, and was consequently recommended in jaundice, cachexies, menstrual obstructions, and hysteria, but its powers are not found by modern practitioners equal to the account ancients gave of them, and therefore it is very seldom prescribed (*London Dispensatory*, 379)

1267. *Leonurus* From λεων, a lion, and ουρα, tail The spikes of flowers have been compared to the tuft which grows on the end of the lion's tail L Cardiaca was formerly used in medicine, but is now neglected. Tall herbaceous plants with cut leaves and whorls of flowers, of which the corolla is woolly

1268 *Phlomis* Φλομος was the Greek name of the Mullein, and so called from φλοξ, fire, because the thick cottony leaves were used as wicks for lamps At this day, P Lychnitis is so called, because the dried leaves, which are cottony and russet colored, are used in Spain for wicks Fine showy small shrubs or herbaceous plants, with corolla covered with down, and usually of a brownish yellow color

1269 *Leucas* A name used by Burmann, neglected by Linnæus and others, and restored by Mr Brown, derived from λευκος, white, in reference to the usual color of the flowers, which are covered all over with a thick covering of wool

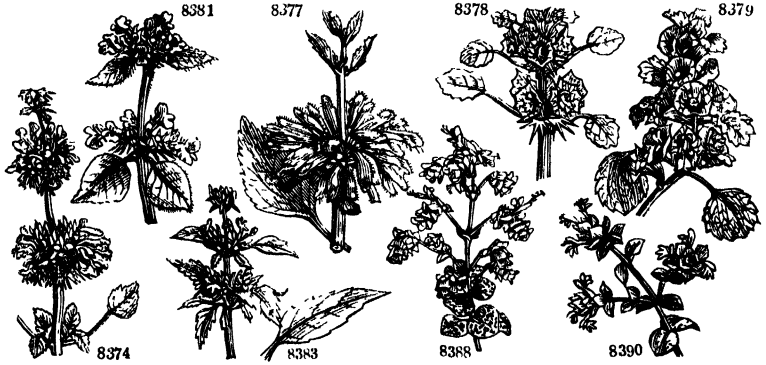
1270 *Leonotis* From λεων, a lion, and ους, an ear A fanciful name applied to the fine scarlet-flowering

8349 Leaves cordate 3-lobed or 5-lobed cut toothed wavy, Cor larger than pungent calyx
8350 Leaves cuneiform ovate 3-lobed toothed, Cor larger than pungent calyx, Middle lobe of lower lip acute
8351 Leaves 3-parted cut, Calyxes villous
8352 Leaves 3-parted multifid linear somewhat blunt
8353 Lvs obl toothed, Cor scarcely longer than somewhat pungent calyx, Middle lobe of lower lip roundish
8354 Leaves about 5-lobed, Lobes blunt toothed at end, Cal sessile spiny

8355 Leaves oblong blunt rugose and branches downy, floral ovate-lanceolate, Bractes ovate acuminate
8356 Leaves elliptical blunt woolly rugose, Branches woolly, Bractes obovate twice as short as calyx
8357 Bractes lanceolate acute pungent Cal 5-cornered acuminate, Leaves densely woolly beneath
8358 Bractes lanceolate blunt unarmed, Cal truncated pointless, Leaves woolly on each side
8359 Lvs downy on each side rad cord sagitt, cauline obl Whorls without bractes, Cal with obl acute teeth
8360 Leaves lanceolate downy floral ovate, Bractes setaceous woolly length of bluntly toothed calyx
8361 Stem hairy, Lvs cordate crenate downy beneath, Bractes 3-parted subulate mucronate as long as calyx
8362 Lvs ovate obl serrate hairy beneath, Teeth of calyx lanc subulate erect, Bractes subul and stem hairy
8363 Radical leaves cordate pubescent, floral lanceolate, Bractes linear subulate villous, Stem pubescent
8364 Radical leaves cordate rough, floral oblong lanceolate, Bractes subulate hispid, Stem smooth
8365 Leaves alternately pinnate, Leaflets lacinate, Calyx woolly
8366 Leaves stalked obl lanc serr at end, rough above downy beneath, Teeth of calyx subulate spreading
8367 Leaves cordate crenate downy beneath, Bractes ovate lanceolate mucronate
8368 Like P fruticosa, but the lower leaves are cordate stalked, Upper ovate

8369 Leaves lanceolate serrate, Heads terminal, Calyxes with 8 teeth
8370 Leaves obl toothed pubes beneath, Whorls many-fl globose, Cal incurv 8-toothed, upper tooth longest
8371 Leaves ovate serrated hoary, Involucre subulate, Cal obliquely truncate membranous 9-toothed
8372 Involucre linear, Cal 1-lipped oblique, Leaves ovate hairy
8373 Lvs lanc smooth serrated at end, Stem 4-cornered rough, Whorls many-fl Lip of cor undivided

8374 Leaves cordate acute serrated somewhat downy, Calyx 7-toothed awned, upper tooth largest
8375 Leaves lanceolate serrate, Calyxes 10-cornered 10-toothed unarmed
8376 Leaves small ovate blunt somewhat downy crenate Cal 7-toothed awned
8377 Leaves stalked ovate cordate acuminate cut-toothed, Cal velvety 10-toothed



8378 Cal 2-lipp upper lip lanc mucron longest, lower round 7-tooth Teeth spiny, Lvs stalk ov deeply tooth
8379 Cal campanulate 5-toothed, Teeth equal pointless, Leaves stalked roundish ovate toothed
8380 Cal. funnel-shaped 5-toothed teeth equal mucronate, Leaves sessile wedge-shaped oblong toothed

8381 Heads whorled, Bractes setaceous hispid, Leaves hairy above remotely toothed, Stem simple
8382 Heads terminal, Bractes setaceous hispid, Leaves smooth above nearly entire

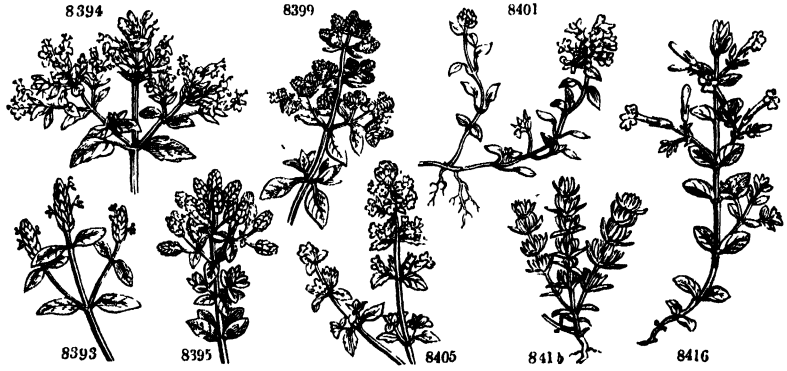
8383 Leaves oblong-ovate acute subserrate hoary, Heads compound, Bractes setaceous, Stamens exserted
8384 Leaves lanceolate ovate subserrate on short stalks somewhat hoary, Heads sessile, Bractes awned
8385 Stem much branched rather rough, Leaves linear 3-nerved entire, Heads terminal fascicled

8386 Stem much branched roughish, Lvs lin lanceolate veiny entire, Heads terminal fascicled corymbose

8387 Leaves concave downy, Spikes naked
8388 Lower leaves downy, Spikes nodding
8389 Leaves all smooth, Spikes nodding
8390 Spikes 4-cornered, Bractes roundish very large
8391 Spikes aggregate long prismatical upright, Bractes membranous twice as long as calyx

and Miscellaneous Particulars

plants, known at the Cape by the name of lion's tail They require a good greenhouse and plenty of air to secure their appearing in perfection In places badly ventilated their leaves acquire a yellow color, and are apt to fall off



1271 *Moluccella* Brought from the Moluccas Plants remarkable for the enlarged calyx in which the flower is seated

1272 *Clinopodium* From κλινη, bed, and πους, a foot. The tufted close whorls of flowers have been compared to the caster of a bed's foot.

1273 *Pycnanthemum* From πυκνος, dense, and ανθος, a flower The blossoms are in a close head A North American genus of plants, some of which, as P verticillatum and incanum, are occasionally seen in gardens

1274. *Origanum* From ορος, a mountain, and γανος, joy These plants, with their pretty spikes of bracteated flowers and agreeable perfume, may indeed be called the joy of the places where they grow naturally O vulgare is an aromatic and ornamental plant, growing wild in thickets and hedges, chiefly in a calcareous soil The dried leaves used instead of tea, are said to be exceeding grateful, they are also used in fomentations the essential oil is so acrid, that it may be considered as a caustic, and is much used with that intention by

History, Use, Propagation, Culture,

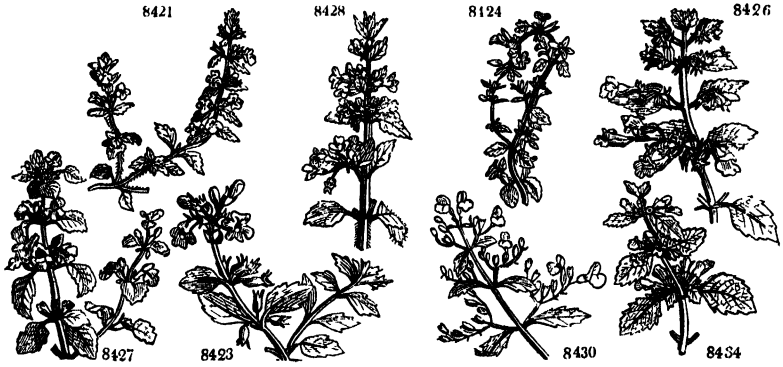
farriers, a little cotton moistened with it, and put into the hollow of an aching tooth, frequently relieves the pain The country people use the tops to dye woollen cloth purple It also dyes linen of a reddish brown color For this purpose the linen is first macerated in alum water and dried, it is then soaked for two days in a decoction of the bark of the crab-tree, it is then wrung out of this, boiled in a ley of ashes, and then suffered to boil in the decoction According to the Swedish experiments, goats and sheep eat it, horses are not fond of it, and kine refuse it

O onites and marjorana are culinary aromatics, the latter being principally in use under the name of knotted marjoram, from the flower coming in whorls at the joints O vulgare and marjorana are both retained in the Materia Medica as tonics and stomachics, though scarcely ever used In quack medicine, the leaves dried and powdered form an ingredient in cephalic snuff Marjorana is so called from *marjamic* (*máryamych*), its Arabic name, according to Forskahl, p 59

1275 *Thymus* From Θυμος, courage, on account of its balsamic smell, which revives the spirits of animals T serpyllum, from ερπω, to creep, is fragrant, and yields an essential oil that is very heating It has the same sensible qualities as garden thyme, but the flavor is milder, and rather more grateful. Its essential oil is both smaller in quantity and less acrid, and its spirituous extract comes greatly short of the penetrating warmth and pungency of the other It is a common notion that the flesh of sheep that feed upon aromatic plants, particularly wild thyme, is superior in flavor to other mutton. The truth is, that sheep do not crop

8392 Leaves ovate acute serrated, Spikes clustered in umbels
8393 Spikes on long stalks aggregate, Bractes the length of calyx
8394 Spikes roundish panicled clustered, Bractes longer than calyx ovate colored
8395 Spikes oblong aggregate hairy, Leaves cordate downy
8396 Leaves stalked ovate pubesc Spikes clustered prismatical, Bractes imbricate ovate smooth ciliated at edge
8397 Leaves stalked ovate acute subserrate hairy, Spikes prismatical, Bractes dense ovate acute
8398 Leaves subsessile ovate acute subserrate hairy, Spikes oblong bluntish
8399 Spikes roundish thin ccmpact stalked, Leaves stalked ellipt. blunt smoothish
8400 Spikes roundish several clustered stalked, Leaves stalked ellipt blunt downy

8401 Flowers capitate, Stems decumbent, Leaves flat blunt ciliated at base
8402 Flowers capitate, Stems creeping hairy, Leaves blunt villous
8403 Leaves ovate smooth with the smell of common balm
8404 Flowers capitate, Stems procumbent, Leaves cuneate linear ciliated at base
8405 Erect, Leaves revolute ovate, Flowers in whorled spikes
8406 Leaves oblong more ciliated than in T serpyllum, Cor with a more obscure spot in the orifice
8407 Stem shrubby, Flowers in whorled spikes, Lvs linear lanc bluntish flat about 3-nerved ciliated at base
8408 Erect, Leaves revolute linear-lanc hairy, Head few-flowered axillary stalked
8409 Flowers capitate, Stems creeping, Leaves linear nerved and furrowed beneath, Bractes ovate
8410 Fl. whorled somew spiked, Ped 1-fl Stem shrubby erect, Lvs ellipt entire acute smooth shining above
8411 Flowers in whorled spikes, Cal woolly with very long setaceous segments
8412 Flowers in whorled spikes, Spikes oblique, Ped. 1-fl Lvs ov obtuse very entire and calyxes nearly naked
8413 Flowers in whorled heads, Stems filiform, Leaves roundish flat hairy nerved ciliate at base
8414 Flowers in whorled spikes, Cal woolly with setaceous teeth, Lvs ellipt entire downy on each side
8415 Flowers in whorled spikes, Stem erect, Lvs linear very blunt nerveless revolute at edge ciliated at base
8416 Pedun about 3-fl. axillary, Lvs ovate blunt nerved entire sess Cor twice as long as calyx, Stem villous
8417 Heads laxly imbricated, Bractes broad ovate colored not dotted, Leaves linear entire
8418 Heads imbricated large, Bractes toothed, Leaves setaceous hairy
8419 Flowers whorled, Stem half-shrubby erect, Leaves hispid acuminate
8420 Flowers axillary subsolitary stalked, Leaves cordate acute entire, Stems filiform



8421 Stem erect branched at base, Leaves ovate acute serrated forwards, Whorls 6-flowered

8422 Hirsute villous larger than the last, Stem much branched, Leaves ovate
8423 Whorls 6-fl Leaves nearly blunt roundish concave subserrated
8424 Nearly smooth, Whorls 6-10-fl Leaves ovate subserrate, Stem ascending
8425 Fls. whorled, Pedunc 1-flow. Stem branched spreading, Leaves roundish acute subserrate at end hairy

8426 Pedun axill 3-4-fl Bractes lanc sessile, Leaves ovate acute finely serrated
8427 Leaves rhomboid oval obsoletely toothed upwards, Whorls somewhat stalked about 10-fl shorter than leaf

8428 Stem weak, Pedun axill many-fl dichotomous, Lvs ovate blunt serrated hairy dotted
8429 Pedunc axill many-fl in dichotomous corymbs, Lvs ovate blunt subserrate smoothish
8430 Leaves ovate somewhat toothed glaucous, Pedunc axill. dichotomous, Segm of calyx equal
8431 Racemes terminal, Peduncles solitary very short
8432 Branches thin twiggy, Leaves downy beneath

8433 Villous, Leaves cordate crenate-toothed, Branches axillary elongated flowering
8434 Whorls halved subsessile, Bractes oblong stalked, Leaves ovate acute serrated

and Miscellaneous Particulars

these aromatic plants, unless now and then by accident, or when they are first turned on hungry to downs, heaths, or commons; but the soil and situations favorable to aromatic plants produce a short sweet pasturage best adapted to feeding sheep, whom nature designed for mountains, and not for turnip grounds and rich meadows The attachment of bees to this and other aromatic plants is well known.

Few plants are subject to more varieties than wild thyme. In its most natural state, on dry exposed downs, it is small and procumbent, but when it grows among furze or other plants, it runs up with a slender stalk to a foot or more in height It differs also very much in the smoothness or hairiness of its leaves. The flowers are sometimes larger than ordinary, and of a paler purple color, or even white

T vulgaris has the aromatic qualities common to lavender, sage, rosemary, and other Verticillatæ. It yields a species of camphor in distillation with water In Spain they infuse it in the pickle with which they preserve their olives Before the oriental spices were common, it was much used in cookery

1276 *Acynos.* The Greek name of a balsamic plant, which probably was related to Thymus. This genus was included in Thymus by Linnæus

1277 *Calamintha* From καλος, beautiful, and μινθη, mint. An ancient Greek name of a plant supposed to chase away serpents

1278. *Melissa* This is the Greek name of the bee, from μελι, honey, which is sought by bees in these flowers with avidity, as indeed it is in all the plants of the order The recent plant has the agreeable odor of

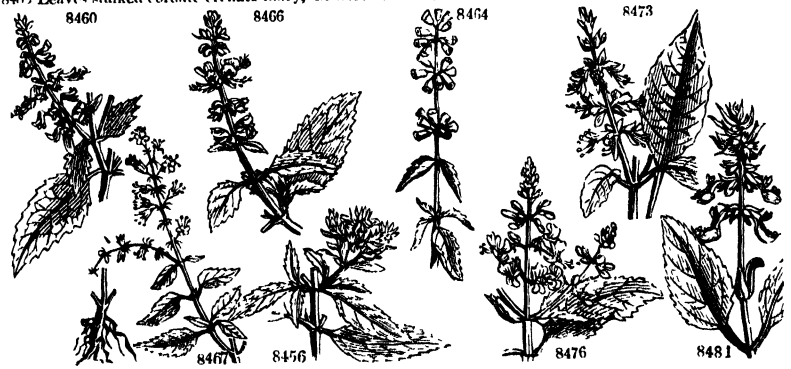
History, Use, Propagation, Culture

lemons, which is lost in drying, and an austere, slightly aromatic taste In distillation with water, it yields a small portion of a yellow essential oil, on which its odor depends It is stomachic and diuretic, and was formerly prized as a corroborant in hypochondriacal and nervous affections, but it is now used only in the form of tea, as a grateful diluent in fevers For medicinal use the herb should be cut before it flowers, as it is then more odorous (*London Dispensatory*, 383)

1279 *Dracocephalum* From δράκων, a dragon, and κεφαλή, a head A name applied in the same sense as Lamium, Galeopsis, &c See those genera Most of the species are plants of ornament, and cultivated as such in the gardens of the curious D canariense smells of citron, especially when rubbed between the fingers Sown on a hot-bed early in spring, it may be planted out in the borders like other tender annuals. D. austriacum is a handsome plant for a flower border.

8435 Smooth, Flowers spiked close, Leaves linear lanceolate serrated
8436 Flowers spiked remote, Leaves obovate lanceolate toothletted upwards
8437 Spikes short 4-cornered, Corolla variegated, Leaves oblong toothletted upwards
8438 Flowers spiked, Leaves ternate oboing
8439 Fl somewhat spiked, Lvs roundish cuneiform sinuate-toothed, Upper lip of cal undivided mucronate
8440 Fl somewhat spiked, Leaves lanceolate remotely mucronate toothed, Bractes lin lanc toothed spiny
8441 Fls spiked, Lvs sessile linear mucronate, Cauline 3-5-parted at base, Stem branched somewhat villous
8442 Flowers spiked, Leaves and bractes lanceolate undivided pointless, Stem nearly simple smooth
8443 Fls whorled, Lvs obl blunt toothed stalked, Bractes lanc entire, Upper lip of cal ellipt blunt undivided
8444 Fls whorled, Rad lvs cord ov , cauline sessile roundish wedge-shaped acutely toothed, Teeth of cal equal
8445 Flowers whorled, Whorls stalked bifid one-sided, Leaves lanc cordate acum serrated smooth
8446 Flowers whorled, Bractes lanceolate deeply toothed dotted beneath, Lower serratures subciliated

8447 Flowers whorled, Bractes oblong ciliated, Cal striated pubescent, Tube of cor longer than calyx
8448 Flowers whorled, Bractes orbicular serrate ciliate
8449 Stem erect, Leaves linear lanceolate blunt entire at edge rough, Two upper teeth of calyx largest
8450 Leaves broad-lanceolate finely serrated entire at base, Lower teeth of calyx longest
8451 Flowers in spiked heads, Leaves roundish pinnatifid crenate downy on each side
8452 Flowers whorled, Bractes oblong ovate entire, Cor twice as long as calyx nodding
8453 Flowers whorled, Bractes oblong entire, Cor scarcely larger than calyx



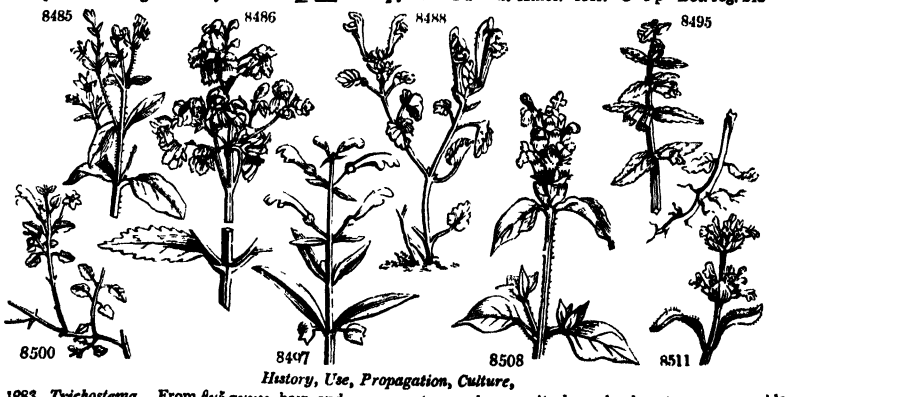
8454 Leaves opposite ovate toothed, Calyx 3-lobed hairy

8455 Cal. 4-lobed smooth, Cor yellowish white, Segment of lower lip violet in the middle

8456 Flowers in panicled fascicles, Stem much branched
8457 Racemes panicled, Leaves ovate oblong cuneate at base acutely serrated hoary beneath
8458 Racemes panicled, Leaves ovate cuneate at base bluntly serrated, Veins hairy above rough beneath
8459 Stamens toothless, every other one bearded at base
8460 Stem ½ shrubby, Leaves lanceolate ovate subtomentose, Racemes rounded
8461 Stem shrubby, Leaves ovate serrate, Stamens very long
8462 Leaves ovate smooth, Calyxes ciliated
8463 Leaves ovate entire
8464 Leaves somewhat oblong blunt serrated wavy, Stem hairy, Bractes cordate
8465 Leaves ovate oblong, Foot-stalks, bractes and calyxes ciliated
8466 Leaves sublanceolate acuminate subserrate, Racemes rounded, Stem nearly herbaceous
8467 Leaves ovate-oblong serrated, Bractes cordate reflexed concave, Spikes filiform
8468 Cor 4-fid, Racemes leafless nodding at end
8469 Leaves linear lanceolate serrate [than calyx
8470 Lvs broad ovate acum at each end serr Bractes shorter than cal winged at edge, Cor scarcely longer
8471 Leaves ovate cordate acute serrated rugose, Recesses closed Bractes roundish wedge-shaped
8472 Leaves ovate, Flowers aggregate, Footstalks lateral
8473 Downy, Lvs ovate lanceolate crenate stalked, Whorls terminal racemose Corolla the length of calyx
8474 Leaves oblong elliptical serrated hoary on long stalks, Stamens twice as long as corolla
8475 Like Ocymum polystachyon, but not having a musky scent as that has

8476 Nectary spurred, Racemes compound Pedunc 2-parted, Stem shrubby polished
8477 Nectary gibbous, Racemes leafless, Stem nearly equal
8478 Nectary gibbous, Racemes compound, Pedunc 1-flowered whorled, Stem half shrubby nearly smooth
8479 Cor falcate, Flower-stalks branched

8480 Nectary gibbous, Flowers spiked, Stem herbaceous hairy rufous dotted
8481 Flowers whorled sessile, Lower lip of calyx 4-parted, Bractes cordate acuminate
8482 Stem 6-angled, Leaves ternate stalked ovate crenate rugose, Roots tuberous
8483 Leaves stalked cordate crenate hairy, Bractes nearly equal to flower ovate



and Miscellaneous Particulars

1280. *Melittis* A name with the same meaning as Melissa
1281 *Ocymum.* Said by Mathiolus to be derived from ὄζω, to smell, on account of the powerful scent of the plants O gratissimum is cultivated in China for culinary purposes. O Basilicum (βασιλικος, royal) and minimum, are culinary aromatics much used in French cookery There are several varieties of the basilicum, which with some other species were formerly used in medicine, but are now neglected
1282 *Plectranthus* From πληκτρον, a cock's spur, and ανθος, a flower, the corolla of the original species of the genus being terminated by a spur-like appendage Half-shrubby plants with purple flowers, all natives of hot climates.

History, Use, Propagation, Culture,

1283. *Trichostema.* From θριξ τριχος, hair, and στημα, a stamen, because its long slender stamens resemble hairs

1284. *Prostanthera.* Named in allusion to the spurs of the anthers, the word being derived from προσθηκη, an appendage, and ανθηρα, the anther. Strong smelling shrubs, natives of New Holland. Flowers either racemose or terminal.

1285. *Scutellaria.* From *scutula*, a small vessel, on account of the figure of the calyx, which is not unlike a cup with its handle. The calyx inverted, presents the figure of a helmet with visor raised.

1286. *Prunella.* A barbarous name softened down by Linnæus from the Brunella of some authors, and so called from the German *die Braune*, a disorder in the jaws and throat, which this plant is said to cure. Herbaceous plants common by way-sides all over Europe

8484 Stamens very long exserted, Leaves linear
8485 Stamens short included

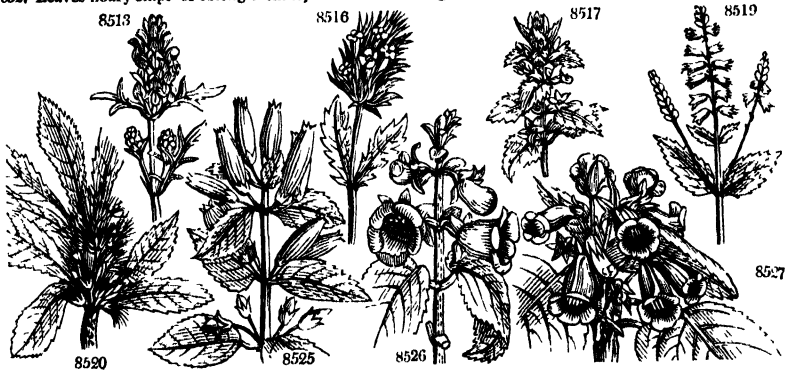
8486 Leaves lanceolate tooth-serrated smooth, Racemes panicled, Corolla hairy

8487 Leaves cut downy beneath, Spikes rounded 4-cornered
8488 Leaves cordate cut crenate pubescent on each side shorter than footstalk, Spikes short 4-cornered
8489 Leaves subcordate serrate rugose opaque, Spikes 1-sided, Bractes ovate
8490 Leaves cordate cut serrate crenated, Spikes imbricated rounded 4-cornered, Bractes twice as short as fl
8491 Leaves cordate cut serrate acute smooth, Spikes imbricated rounded 4-cornered, Bractes length of flowe
8492 Much branched, Leaves smooth with a scabrous keel, Racemes lateral leafy
8493 Hairy, Leaves ovate rhomboid crenate, Flowers subracemose
8494 Leaves cordate lanceolate crenate, Flowers axillary
8495 Leaves cordate ovate nearly entire, Flowers axillary
8496 Leaves quite entire, lower hastate, upper sagittate, Flowers axillary
8497 Branched very smooth, Leaves stalked linear lanceolate acute entire, Racemes loose leafy, Cal blunt
8498 Simple densely pubes Lvs subsess. obl or linear blunt entire attenuated at base, Racemes loosish leafy
8499 Branched tall pubescent, Leaves ovate acuminate serrate on short stalks, Racemes usually panicled
8500 Leaves cordate ovate crenate, Flowers solitary axillary, Each lip of cor trifid
8501 Leaves cordate serrate, Spikes elongated 1-sided, Bractes stalked ovate longer than calyx
8502 Leaves oblong cordate serrate pubes Spikes elongated 1-sided, Bractes stalked ovate shorter than calyx
8503 Leaves cordate oblong acuminate serrate, Spikes nearly naked
8504 Villous, Leaves cordate blunt and bluntly serrated, Spikes imbricated, Bractes setaceous
8505 Subvillous, Leaves ovate entire all alike, Flowers axillary
8506 Related to S. albida from which it differs in being much less hairy, and in its more slender flower
8507 Lvs. cord cren. serrate bluntish villous, Spikes long 1-sided hispid, Bractes stalked ovate longer than cal

8508 Lvs stalked obl ovate somew toothed, Upper lip of cor crun with 3 awns, Stem ascending, Spike round

8509 Leaves broad ovate toothed, Stem much branched, Spikes ovate
8510 Lvs stalked ovate lanc toothed at base, Lips of cal equal upper truncate with 3 awns, Stem ascending
8511 Leaves sessile lanceolate entire rough, Stem erect
8512 Leaves stalked oblong ovate toothed at base, Upper lip of cor trifid, Stem ascending
8513 Small, Stem nearly simple villous, Leaves pinnatifid lower oblong, Cor pale yellow
8514 Leaves entire and sinuated toothed rugose hairy, Upper lip of cor truncate slightly 3-toothed
8515 Upper leaves linear-lanceolate lower sinuate toothed somewhat hairy

8516 Bractes lacinate



8517 Leaves ovate oblong serrated
8518 Leaves ovate with a double crenature on each side

8519 Leaves stalked ovate serrated, Spikes terminal long

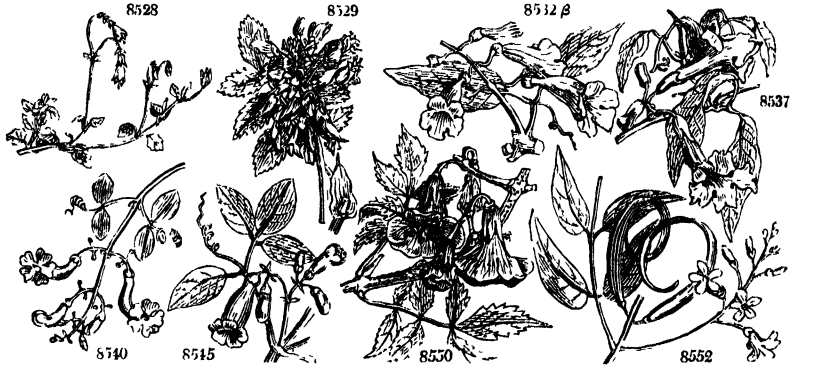
ANGIOSPERMIA.

8520 Leaves lanceolate ovate serrated somewhat stalked terminal, Pedunc 3-fl shorter than leaves
8521 Leaves ovate lanceolate crenate hairy, Peduncles lateral very long bearing corymbs
8522 All vill Branches rounded, Lvs opp obl ovate cren Ped 2-4 axill 1-fl aggregate, Cor clavate cylind
8523 All pubes Lvs opp ovate ellipt cord at base serr cren Panicle numer opp spread dist. Ped corymbose
8524 All pubes. Lvs oval lanc velvety above, Panicle leafy, Fl with a campan inflated orifice, Limb oblique
8525 Leaves opposite ovate crenulate tomentose, Flowers axillary 2-3 together downy

8526 Leaves oblong cordate crenate rugose, Stem spotted
8527 Leaves hoary ellipt or oblong crenate, Peduncle erect longer than flower, Sepals angular acuminate

and Miscellaneous Particulars

1287. *Cleonia.* An ancient Greek name employed by Theophrastus, *lib* 7 *cap* 4 : the Cleonæum of Pliny This is an annual plant six or eight inches high, and nearly related to Prunella, from which some eminent French botanists do not distinguish it.



1288. *Prasium.* The Greek name of the horehound, which this plant resembles in some respects.

1289 *Phryma.* A Linnean name, the meaning of which is unknown

1290 *Gesneria* In honor of Conrad Gesner, of Zurich, the famous botanist and natural historian, called the German Pliny Very fine herbaceous or half-shrubby plants, some of which are remarkable for the brilliance of their colors

1291 *Gloxinia.* In memory of Ben Petr Gloxin, of Colmar, author of Observationes Botanicæ, Argent,

History, Use, Propagation, Culture,

1785, quarto Handsome low herbaceous plants, with fine shewy flowers The Gloxinia speciosa is a favorite in every hothouse, on account of the beauty of its rich purple blossoms

1292 *Linnæa* So named by Gronovius, in honor of the celebrated Carl von Linné, the reformer of natural history, and the father of the modern physical sciences His works are not less numerous than important, it is to be wished that such another man, with equal talent, industry, and judgment, could be found at the present day, to rescue the science of natural history from the confusion to which it is fast approaching

1293 *Melianthus* From μελι, honey, and ανθος, flower A shrub, native of the Cape of Good Hope, the blossoms of which are a great attraction to bees Both the known species are common in collections, but seldom flower

1294. *Bignonia.* In memory of Abbé Bignon, librarian to Louis XIV, born 1662, died in 1743 He was the friend and patron of most of the learned men of his time, and especially of Tournefort, by whom this truly noble genus was named The species are trees or shrubs, inhabitants of hot climates the leaves are opposite, pinnate, ternate, or conjugate the flowers in panicles, large, and handsome, of various colors, red, blue, yellow, or white, and eminently beautiful The stove sorts grow freely in loam and peat, and young cuttings root in sand under a hand-glass The hardy species grow in any soil, but will not flower well unless the situation be warm. They are increased by cuttings of the roots, by layers, or by young cuttings on gentle heat under a hand-glass or frame B radicans is a well known and much admired species, capable of living in the open air in this country against a wall

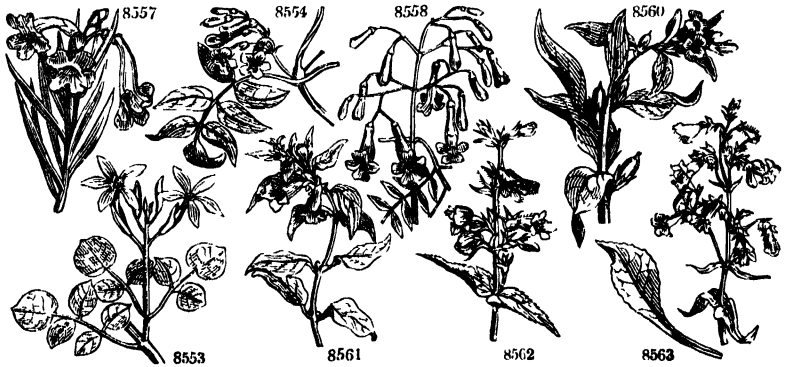
1295. *Jacaranda* The name of the tree in Brazil Two kinds remarkable for the goodness of their wood, are described by Piso Those in the gardens are lofty stove plants with fern-like, elegant leaves, and panicles of beautiful blue flowers They grow with facility, but flower seldom

8528 The only species

8529 Stipules solitary adhering to stalk, Leaves smooth
8530 Stipules twin distinct, Leaves hoary beneath

8531 Leaves conjugate cirrhose, Leaflets ovate acuminate, Peduncles axillary 1-flowered
8532 Leaves conjugate cirrhose, Leaflets ovate-lanceolate, Pedunc. 2-flowered, Pods linear

8533 Leaves conjugate, Leaflets elliptical entire coriaceous, Pedunc 5-flowered axillary, Calyx entire
8534 Lvs conjugate obl smooth, Racemes term Branches dichotomous, Corollas very soft and downy outside
8535 Leaves conjugate cordate ovate, Flowers racemose, Calyx with a double limb
8536 Leaves conjugate cirrhose lower ternate, Leaflets ovate cord acuminate, Racem axill Stem muricated
8537 Leaves conjugate quite smooth, Tendrils longer than petiole trifid at end hooked
8538 Leaves conjugate cirrhose, Leaflets cordate lanceolate, Lower leaves simple
8539 Leaves conjugate cirrhose, Leaflets cordate ovate downy beneath
8540 Leaves conjugate cirrhose, Leaflets elliptical blunt, Flowers racemose, Pedunc 3-fl Calyxes toothed
8541 Leaves conjugate cordate ovate smooth, Lower racemes leafy, Limb of calyx leafy entire
8542 Leaflets 9-lanceolate subserrate dotted beneath, Corollas ventricose bearded in the orifice
8543 Lvs conjugate cirrhose, Leafl obl acute at each end, Corymb trifid term Ped petioles and branches rough
8544 Climbing, Lvs smooth upper conjugate cirrhose obl ovate acum n Peduncles corymbose many-flowered
8545 Lower leaves ternate, upper conjugate, Petioles dichotomous cirrhose, Fruit echinate
8546 Leaves ternate smooth, Leaflets ovate acuminate, Stem shrubby erect
8547 Leaves digitate, Leaflets entire obovate
8548 Leaves digitate, Leaflets lanceolate acuminate entire smooth, Flowers terminal solitary
8549 Lvs pinnate, Leaflets ovate acuminate toothed, Corymb terminal, Tube of cor thrice as long as calyx



8550 Leaves pinnate, Leaflets ovate acuminate toothed, Panicle terminal, Tube of cor the length of calyx
8551 Leaves pinnate, Leaflets oblong lanceolate serrate, Raceme simple terminal, Stem erect
8552 Leaves pinnate with an odd one, Leaflets ovate entire pubescent, Corollas bearded half pentandrous
8553 Leaves pinnate with an odd one, Leaflets ovate hirsute, Cal. 1-leaved spathaceous, Cor hypocrateriform

8554 Leaves pinnate of four pair, Leaflets elliptical generally entire, Racemes compound
8555 Leaves bipinnate, Leafl roundish ovate cordate acuminate, Fl pentandrous, Calyx tubular, Cor 5-fid
8556 Leaves bipinnate, Leaflets oblong obtuse, Panicle terminal, Peduncles with bractes, Pods oblong blunt
8557 Leaves simple linear acuminate, Flowers terminal subumbellate, Stem erect

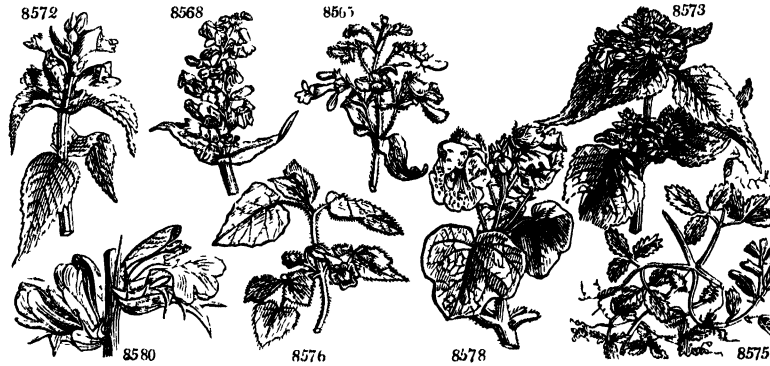
8558 Leaves bipinnate, Leaflets lanceolate acute, Panicle terminal, Peduncle naked, Pods long emarginate
8559 Leaves bipinnate oblong villous oval oblong mucronate, Panicle large lax branched, Corollas silky

8560 Leaves ovate oblong entire
8561 Leaves ovate lanceolate lower 3-lobed, upper undivided, Stem erect

8562 Stem smooth, Sterile filament bearded upwards, Leaves lanceolate acuminate all finely serrate
8563 Leaves polished ovate-oblong amplexicaul finely toothletted, lower entire, Flowers panicled
8564 Leaves serrulate lanceolate oblong sessile downy obscurely toothed narrow, Flowers panicled

and Miscellaneous Particulars.

1296. *Sesamum* From the Arabic word *semsem*. Forskahl, p 68 These plants were introduced into Jamaica by the Jews, and are now cultivated in most parts of the island They are called *vangio* or oil-plant. The seeds are frequently used in broths by many of the Europeans, but the Jews make them chiefly into cakes. Many of the oriental nations look upon the seed as a hearty wholesome food, and express an oil from them, not unlike, or inferior to, the oil of almonds. It has been also manufactured for salad oil in this country, but without much success



S orientale is frequently cultivated in the Levant, and also in Africa, as a pulse the seeds have been introduced in Carolina by the African negroes An oil is extracted from the seeds which will keep many years, and not acquire any rancid smell or taste, but in two years become quite mild, so that when the warm taste of the seed, which is in the oil when first drawn, is worn off, it is used as salad oil, and for all the purposes of sweet oil

The seeds are also used by the negroes for food they parch them over the fire, then mix them with water, and stew other ingredients with them. A pudding is made with them, in the same manner as with millet or rice

In Japan, China and Cochin-China, where they have no butter, they use the oil for frying fish, and in dressing other dishes; as a varnish; and medicinally as a resolvent and emollient Nine pounds of the seed yield upwards of two pounds of neat oil

1297 *Pentstemon* From πεντε, five, and στημων, a stamen, because of the four perfect and one imperfect stamen of the genus. Beautiful herbaceous plants, deserving a place in every garden.

History, Use, Propagation, Culture,

1298. *Chelone* Χελώνη signifies a tortoise, to the back of which the helmet of the present genus has been fancifully compared The species are handsome border flowers, of easy culture in loamy soil, or loam and a little peat.

1299 *Tourrettia* Named in honor of Marc Antoine Louis Claud la Tourrette, to whom some of Rousseau's Letters on Botany are addressed A singular climbing annual plant, producing its flowers sparingly from the tips of the branches Seldom preserved long in a garden, as it produces seed very sparingly

1300. *Martynia* In honor of John Martyn, F R S, professor of botany at Cambridge, author of Historia Plantarum Rariorum, and many other works died in January, 1768 His son is the editor of the last edition of Miller's Dictionary. Handsome tropical annuals, remarkable for the size of their flowers compared with their leaves

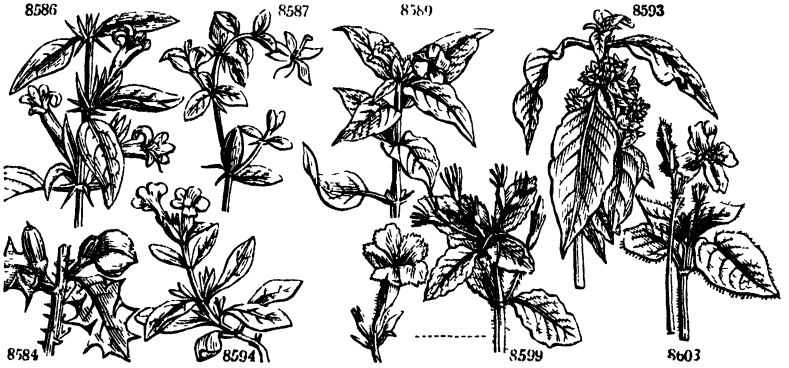
1301 *Acanthus* From ακανθα, a spine many of the kinds are very spiny The species are generally large, with a single herbaceous stalk, and great pinnatifid leaves The flowers are produced in terminating spikes. Some of the species are shrubby and thorny, with undivided leaves, toothed, and having a thorn at the end of the teeth.

A. mollis was formerly used in medicine under the name of *Branca ursina*: the root abounds in mucilage, and may be substituted for those of the marsh mallow Virgil has two very different plants under the name of Acanthus: one a tree, supposed to be the Mimosa nilotica, which produces the gum Arabic: the other an

8565 Stem pubescent, Sterile filament bearded from the end to the middle
8566 Leaves oblong acute subhirsute, Flowers racemose, Leaves of calyx linear very hairy
8567 Stem smooth long linear entire, Flowers in racemose panicles, Leaves of calyx smooth
8568 Stem and lvs. smooth, Lvs subamplex ovate obl ent Barren filam naked clav Sepals roundish acuminate
8569 Very smooth, Lvs subamplexicaul ov obl. ent upper roundish, Barren filam with a short beard at end
8570 Leaves ovate lanc subserrulate smooth, Fl fascicled axillary and terminal, Cor. equal 5-cleft spreading

8571 Leaves stalked lanceolate serrate upper opposite
8572 Leaves lanceolate oblique stalked opposite finely serrated at edge
8573 Smooth much branched, Leaves stalked cordate ovate serrated, Spikes terminal dense
8574 Leaves opposite connate lanceolate entire, Lower lip of corolla bearded

8575 The only species. Leaves pinnated cut cirrhose



8576 Stem branched, Leaves opposite cordate toothed, Flowers diandrous
8577 Stem branched, Leaves opposite 5-lobed toothed
8578 Stem branched, Leaves alternate cordate entire
8579 Stem simple, Leaves roundish repand, Tube of cor at base gibbous flattened

8580 Leaves sinuated unarmed
8581 Leaves sinuated unarmed glabrous shining green
8582 Leaves pinnated spiny
8583 Leaves laciniate pinnatifid blistered spiny, Spines white
8584 Leaves repand spiny-toothed, Stem shrubby prickly

8585 Spines of whorls 6, Leaves ensiform very long rough
8586 Spines axillary pedate in fours, Leaves quite entire lanceolate ovate
8587 Spines axillary opposite solitary, Leaves roundish entire
8588 Unarmed, Leaves lanceolate, Flowers axillary solitary sessile
8589 Leaves ovate lanceolate rough, Flowers capitate terminal, Bracteæ ciliate
8590 Leaves oblong entire, Two lateral leaves of calyx ciliated wider than the rest, two linear acute
8591 Unarmed, Leaves lanceolate hairy entire, Fl aggregate terminal tubular, Bractes very narrow setose
8592 Unarmed, Leaves ovate silky, Bractes cordate scarious, Corollas very long

8593 Leaves lanceolate on long stalks, Flowers in terminal and axillary heads, Cor small

8594 Leaves sessile oblong entire acute at each end villous, Fl 3-subsessile, Stem ascending
8595 Leaves stalked ovate entire, Peduncles 3-flowered very short, Stem erect
8596 Subvillous, Stem dwart branched erect, Leaves ovate concave entire
8597 Leaves stalked ovate very blunt entire pubescent, Flowers 3 subsessile, Stem erect divaricating
8598 Lvs stalked obl ovate ciliated somewhat toothed, Peduncle very short about 3-fl Stem very villous erect
8599 Leaves stalked oblong blunt attenuated at base somewhat toothed, Peduncle 3-fl shorter than leaf
8600 Leaves entire, Peduncles dichotomous lateral, Calyxes sessile, with the upper segment largest
8601 Leaves cuneate ovate crenated, Peduncles 3-parted, Stem simple
8602 Flowers twin sessile
8603 Leaves stalked entire ovate downy, Peduncle axillary alternate few-flow very long

and Miscellaneous Particulars.

herb, supposed to be this plant Pliny mentions an Acanthus which covered part of his lawn, which some conjecture to be a moss, a thing very improbable in a climate and situation where the musci are seldom seen even in winter

The leaf of Acanthus mollis is supposed to have furnished the ancients with the elegant Acanthus leaf of their architecture.

1302 ***Barleria*** In honor of the Rev James Barrelier, a Dominican, and M D of Paris, who travelled from France into Spain and Italy, and died aged sixty-eight, 1673, author of Icones, 1714, Paris, folio, a useful work, containing, even at the present day, figures of many things which are to be found nowhere else The species flower freely and are of easy culture loam and peat, with a little rotten dung mixed with it, is the best soil for them. Cuttings root freely, they strike best from the young wood, under a hand-glass, in the same kind of soil as the plants grow in (*Bot Cult* 21)

1303. ***Phaylopsis*** Named by Willdenow, from φαυλος, vile or contemptible, and ὀψις, aspect Tropical weeds

1304 ***Ruellia*** In honor of John Ruelle, a native of Soissons, the physician of Francis I He published a work De Natura Plantarum, in 1536, and Commentaries upon Dioscorides, in 1516. The species are pretty plants, free flowers, and of the easiest culture and propagation.

History, Use, Propagation, Culture,

1305. *Blechum* Βληχων, was the Greek name of a plant resembling Marjoram. This genus has also the flowers in a dense bracteated spike It has been separated from Justicia by Jussieu

1306. *Aphelandra* From αφελης, simple, and ανηρ, a male, on account of the single cell of the anthers.

1307 *Crossandra.* From κροσσος, a fringe, and ανηρ, a man; or, in botanical language, an anther, alluding to the fringed anthers A fine shewy shrub with large orange flowers

1308 *Thunbergia* In honor of Charles Peter Thunberg, M. D, knight of the order of Vasa, professor of botany in the university of Upsal, member of several learned societies, author of Travels into Europe, Africa and Asia, Flor Japonica, &c Handsome climbing flowers with a fragrant odor.

1309 *Hebenstretia* John Ernest Hebenstreit, was a professor of botany in the university of Leipsig, and published, in 1728, a dissertation upon plants Small Cape undershrubs, occasionally cultivated for the sake of their neat foliage and simple modest flowers They require an airy greenhouse, and are easily propagated from cuttings

1310. *Hosta* After Dr Nicholas Thomas Host, the author of the superb Gramina Austriaca, in four volumes, folio, and other important works Smith thinks the genus the same as Linnæus's Cornutia pyramidata

8604 Leaves stalked ovate acuminate wavy crenate, Fascicles axillary on long stalks
8605 Leaves ovate somewhat toothletted ciliated at edge on long stalks, Flowers solitary axillary sessile
8606 Leaves oblong entire, Flowers solitary sessile, Stem procumbent
8607 Leaves entire ovate subpubescent, Flowers solitary axillary, Stem erect
8608 Leaves ovate lanceolate entire stalked smooth, Fl solitary axillary sessile, Branches warted
8609 Leaves ovate lanceolate acuminate entire, Peduncles long 2-flowered
8610 Leaves stalked oblong wavy, Heads axillary sessile, Stem erect
8611 Stem erect hairy, Leaves stalked ovate acuminate repand toothed hairy, Spike whorled

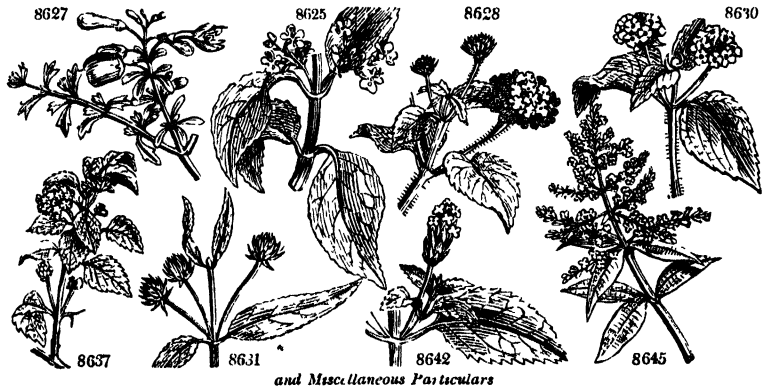
8612 Leaves ovate elliptical somewhat toothed, Spikes 4-cornered, Bractes ovate downy

8613 The only species

8614 The only species

8615 Leaves cordate acuminate somewhat angular at base, Stem climbing
8616 Leaves angular cordate, Inner calyx none, Anthers bearded spurred

8617 Leaves linear toothed, Bractes oval linear hairy
8618 Leaves sessile oblong lanceolate blunt serrated hairy at base, Bractes ciliated
8619 Leaves linear toothed, Spikes smooth
8620 Leaves linear quite entire



8621 Leaves linear toothed, Calyxes 3-valved ciliated
8622 Leaves linear toothed at end, Bractes ovate villous, Stem herbaceous
8623 Leaves lanceolate oblong serrated pilose, Bractes entire ciliated hispid
8624 Leaves cordate somewhat fleshy sessile

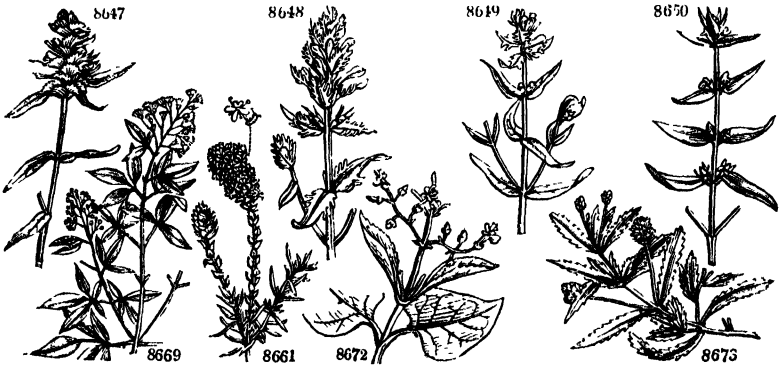
8625 Corymbs axillary trichotomous

8626 Spines opposite, Leaves ovate entire
8627 Leaves obovate subtrifid and simple, Prickles nearly straight, those of the stem alternate

8628 Leaves opp ovate acute hairy, Stem prickly downwards, Heads round, Bractes lanceolate
8629 Leaves 3 or 4-ellipt rugose above villous beneath, Stem unarmed, Spikes oblong imbricated
8630 Leaves opposite, Stem unarmed, Spikes oblong
8631 Leaves opp oblong lanc acute, Stem unarmed, Heads roundish, Bractes ovate-lanceolate and squarrose
8632 Lvs opp ov acute serr rugose rough hairy beh Stem nearly unarm rough, Heads obl Bractes ovate acute
8633 Leaves opposite, Stem unarmed branched, Flowers in leafless capitate umbels
8634 Leaves opp or in 3s rhomboid ovate blunt rugose downy, Stem unarmed, Heads squarrose, Bractes ovate
8635 Leaves opposite oval rugose, Stem unarmed, Heads squarrose, Bractes oblong, Pedunc longer than leaf
8636 Lvs opp or in 3s ellipt rugose, Stem unarmed, Heads squarrose with lanc bractes, Ped shorter than leaf
8637 Leaves opp ovate obl villous soft, Stem prickly, Spikes hemispherical, Bractes half as short as tube
8638 Lvs opp ovate ellipt rough, Stem prickly, Spikes hemispherical, Bractes half as short as tube lanc acute
8639 Leaves ovate lanceolate acuminate crenulate, Stem prickly, Head hemispherical, Bractes linear
8640 Leaves ovate subcordate softish beneath, Stem prickly, Bractes of heads linear cuneiform
8641 Lvs ovate rugose crenate blunt downy running down the foot-stalk, Head depressed shorter than leaf
8642 Leaves opposite ovate rough above hoary beneath, Heads conical, Bractes squarrose ovate acute nerved
8643 Leaves narrowed from an ovate base sessile serrate pubescent, Bractes lanceolate concave
8644 Leaves ovate narrowed into the stalk acuminate acutely crenate pubescent, Outer bractes cordate

8645 Leaves linear lanceolate ternate, Stem shrubby

and Miscellaneous Particulars



A small shrub rising to the height of four feet Leaves opposite, ovate, acuminate, somewhat toothed, smooth. Flowers blue, in axillary corymbs, which are shorter than the leaves, they are dotted all over with minute white glandular spots.

1311 *Gmelina.* In honor of John George Gmelin, a German naturalist, professor of medicine and botany at Tubingen, who travelled in Siberia and Kamtchatka, by order of the Empress Anne of Russia His Flora Sibirica, in four quarto volumes, is a book of continual reference These are fine arborescent Indian plants with beautiful flowers, which are seldom produced in this country They require the utmost heat of the stove

1312 *Lantana* One of the ancient names of the Viburnum, which this resembles a little in foliage The species are rapid growers and free-flowerers, and readily increased by cuttings They form small bushes with pink, yellow, orange, or changeable heads of flowers, and a peculiar aromatic odor.

1313 *Aloysia* Named by Don Antonio Palau, professor of botany at Madrid, and author of an excellent translation of the Linnæus's Species Plantarum into Spanish, after her majesty Maria Louisa, queen of Spain, and mother of the reigning king, Ferdinand.

History, Use, Propagation, Culture,

A deciduous under shrub with a most agreeable odor of citrons, and of the easiest culture in any soil. In Jersey and Guernsey, it stands the winter in warm situations

1314. *Lippia.* Named in honor of Augustine Lippi, a French physician, born in Paris of an Italian family He accompanied the ill-fated embassy of Lenoir Duroule to the king of Abyssinia, in the beginning of the eighteenth century, and was assassinated along with the ambassador at Sennaar His merits entitled him to a more interesting genus than this, which consists of obscure weedy shrubs of South America

1315. *Melampyrum* From μελας, black, and πυρος, wheat Its grain resembles a grain of wheat, and gives a singularly black color to bread in which it is mixed. Smooth narrow-leaved weeds, not uncommon in corn fields and copses M pratense is considered nutritive, and was formerly cultivated by the Dutch and Flemish in the manner of [illegible] rey

1316 *Selago* Others Anothing beyond its name in common with the Selago of the ancients; nor is it possible to imagine Induced Linnæus to apply it to the present plants, which are pretty half-shrubby Cape plants, with [illegible] universit corymbs or spikes of flowers. Hardy greenhouse plants, propagated with facility by cuttings. Flor. J

1317 *Vitex.* A [illegible] tia. Jname applied to some plant of the osier tribe. V Agnus Castus is an autumn shrub, with whorled spik [illegible] lissene and white flowers from seven to fifteen inches long The dried leaves have a powerfully aromatic [illegible] r The seeds, from the time of Dioscorides and Pliny, have been highly celebrated for securing chastity hence the absurd officinal name of the shrub, Agnus castus, αγνος, in Greek, being the same with *castus* in Latin. and hence the Athenian matrons, in the sacred rites of Ceres, used to strew their

8646 Leaves oblong acute serrate rough above pubescent beneath, Heads globose, Bractes obl lowest longest

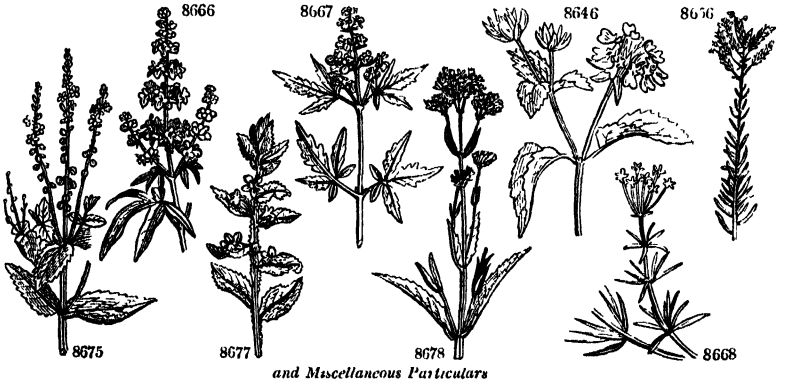
8647 Spikes quadrangular, Bractes cordate compact toothletted imbricated
8648 Spikes conical lax, Bractes toothed setaceous colored, Teeth of calyx rough, Corolla closed
8649 Flowers axillary 1-sided, Corollas closed, Leaves lanceolate, floral hastate
8650 Flowers axillary 1-sided, Corollas gaping, All the leaves lanceolate

8651 Leaves linear acute entire reflexed rigid fleshy smooth, Spikes terminal
8652 Leaves linear smooth, Spikes terminal, Branches diffuse
8653 Leaves linear serrate toothed subciliated fleshy, Spikes corymbose
8654 Spikes terminal, Bractes and calyxes keeled rough, Leaves linear smooth reflexed at edge
8655 Leaves sessile linear lanceolate acute entire smooth, Spikes terminal solitary
8656 Spikes corymbose, Leaves linear toothletted
8657 Corymb multiplex, Leaves obovate smooth serrated
8658 Leaves obovate entire shining, Spikes rounded terminal, Stem shrubby
8659 Stem diffuse pubescent upwards, Lvs lanceolate blunt finely serrate smooth, Spikes terminal subsolitary
8660 Lvs rounded with a furrow on each side acutish somewhat toothed smooth fleshy, Spikes term aggregate
8661 Spikes cone-like ovate terminal, Leaves scattered linear, Stem shrubby
8662 Spikes terminal, Leaves filiform fascicled smooth
8663 Leaves filiform fascicled smooth, Panicle compound

8664 Leaves simple ovate
8665 Leaves ternate entire, Panicle whorled, Berry 3-seeded
8666 Leaves digitate 7 or 5 lanceolate nearly entire, Spikes whorled panicled

8667 Leaves digitate 5, Leaflets cut pinnatifid, Spikes somewhat whorled
8668 Leaves digitate 5, Leaflets stalked oblong entire, Panicle dichotomous, Berry 1-seeded
8669 Leaves quinate and ternate serrate, Flowers in panicled racemes
8670 Lvs ternate and quinate, Leafl lanc acum ent beneath white with down, Branches of pan dichotom
8671 Leaves ternate and quinate, Leaflets ovate acute entire hoary beneath, Panicle with a straight rachis

8672 Panicle terminal naked elongated



8673 Spikes ovate, Leaves lanceolate serrated plaited, Stem truticose
8674 Spikes roundish conical, Leaves cuneiform toothed, Stem creeping

8675 Spikes lax, Cal. of fruit reflexed roundish didymous hispid

8676 Spikes filiform very long, Cal of fruit reflexed hispid, Tube of corolla spiral

8677 The only species

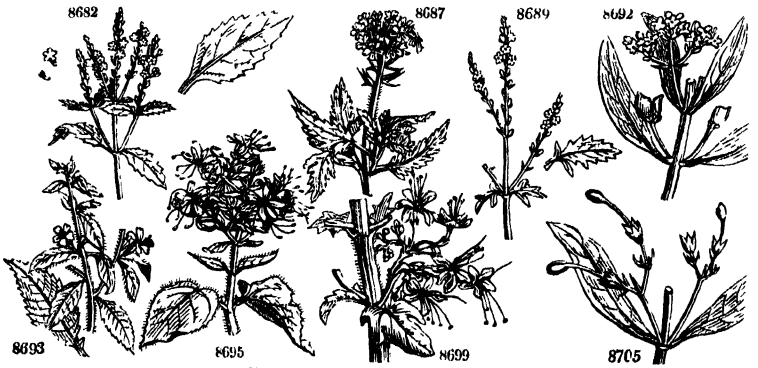
8678 Spikes fascicled, Leaves oblong lanceolate stem-clasping, Stem very tall trichotomous at end
8679 Spikes long acuminate, Leaves hastate
8680 Spikes filiform panicled, Leaves lanceolate coarsely serrated

and Miscellaneous Particulars

couches with the leaves Hence also it has had the affected name of Piper eunuchorum and monachorum. The seeds of the chaste-tree are, however, so far from being thought antiaphrodisiac, that writers of later times have ascribed to them an opposite quality, their aromatic pungency seems to favor this opinion, and Bergius states them to be carminative and emmenagogue (*Woodville*)

The fruit of V trifolia is reputed in the eastern countries to be warm, discutient, nervine, cephalic, and emmenagogue, and to be of service in paralysis, weakness, and pains of the limbs. It is in great use among the Indian practitioners, both internally and externally The plant has a bitter taste, and a strong somewhat aromatic smell.

1318 *Cornutia* So named after Jacques Cornut, a French physician, who travelled into Canada, and published an account of the plants of that country in 1635 Cornutia pyramidata is a shrub with square branches, elliptical ovate entire hoary leaves, and naked pyramidal terminal branches of flowers.



1319. *Zapania* Named by Scopoli, after Paul Anthony Zappa, an Italian botanist

1320. *Priva* A genus of small Verbena-like herbaceous plants, with little blue flowers. The derivation of the name is unknown

1321 *Spielmannia.* In honor of James Reinhold Spielmann, professor of medicine and botany at Strasburg, author of Prodromus Florae Argentoratensis, Pharmacopoeia Generalis, &c. A shrub of easy culture in any light soil, and cuttings root freely under a glass

1322 *Verbena.* Said by De Theis, to be derived from *ferfaen*, its name in Celtic. A genus of weedy plants,

History, Use, Propagation, Culture,

with the exception of Verbena Aubletia and Lamberti V officinalis was held sacred among the ancients, and used in making leagues by ambassadors, sacrificial rites, incantations, &c ; and by the moderns as an amulet, and for medical purposes it is now, however, entirely out of use

1323 *Avicennia* Named after Abu Vah Ibn Tain, commonly called Avicennes, a Persian physician, born in 980, died in 1036 His Rules of Medicine were formerly the text-book of physicians, and have occupied the learning and time of many commentators

1324 *Caldasia* Named by Willdenow in compliment to Don Josef Caldas, an eminent botanist, native of Popayan, in New Grenada

1325 *Clerodendrum.* From κλῆρος, accident, and δενδρον, a tree, in allusion to the various effects in medicine by its various species Clerodendrum fortunatum is useful, C calamitosum and infortunatum, dangerous The species grow freely in light rich soil, composed of half loam, one-fourth of rotten dung, and one-fourth peat. They require a large pot to flower freely, and cuttings root readily under a hand-glass · the younger the shoots the better. The handsomest species are C paniculatum and C squamatum (*Bot Cult* 41)

C inerme is hardy enough to live in the open air against a wall, but it must have the protection of a mat in winter.

1326 *Volkameria.* Named after John Christopher Volkamer, a German botanist, who died in 1720 John

8681 Spikes filiform, Leaves linear lanceolate subserrate
8682 Spikes filiform, Leaves lanceolate serrate bluntish subsessile
8683 Spikes filiform paniced, Leaves ovate serrate acute stalked
8684 Hoary, Spikes cylindrical upright, Leaves ovate serrate subsessile, Stem erect round
8685 Spikes solitary stalked, Leaves trifid cut
8686 Decumbent hirsute, Leaves cut, Flowers spiked, Bractes linear very long squarrose
8687 Spikes lax solitary, Stem hispid decumbent rooting, Leaves oblong cut-toothed entire at end
8688 Spikes filiform, Leaves multifid cut, Stems numerous
8689 Spikes filiform paniced, Leaves multifid cut, Stem subsolitary
8690 Spikes filiform solitary, Leaves bipinnatifid
8691 Hirsute, Spikes filiform solitary, Leaves serrate cut, Calyxes twice as long as fruit

8692 Leaves oblong blunt downy beneath

8693 The only species

8694 Leaves subcordate tooth-serrate pubesc with 2 glands at base, Corymb terminal hemispherical compact

8695 Somewhat downy, Leaves cordate toothed, Cal large 5-cornered viscid, Segm of cor on one side
8696 Leaves subcordate entire, Cor thrice as long as tube of calyx, Limb bilabiate
8697 Leaves lanceolate quite entire
8698 Leaves cordate obscurely angular, Panicles of branches dichotomous smooth
8699 Leaves 5-lobed toothletted smooth, Panicle brachiate, Axillæ woolly
8700 Leaves lobed and undivided broad ovate entire, Panicle trichotomous
8701 Leaves elliptical acute entire and calyxes downy, The calyx in fruit thickened colored, Corymbs clustered
8702 Leaves oblong lanceolate entire, Petioles peduncles and calyx hairy
8703 Leaves lanc or lin lanc entire quite smooth, Corymbs axill. and term Cal 5-toothed and pedunc smooth
8704 Leaves ovate entire shining, Petioles peduncles and calyxes smooth
8705 Leaves whorled long lanceolate entire smooth, Corymbs axillary few-flowered, Corollas very long
8706 Leaves broad-ovate acuminate serrate subsessile downy beneath, Cal 5-toothed, Cor labiate
8707 Leaves ovate entire toothed and angular, Peduncles axillary about 2-flowered
8708 Leaves ovate blunt downy beneath ribbed rugose, Corymb trichotomous

8709 Leaves oblong acute entire, Spines from the rudiments of petioles
8710 Leaves obovate entire retuse shining, Peduncles axillary about 1-flowered
8711 Unarmed, Leaves cordate ovate acute toothed, Racemes 1-sided

8712 Leaves stalked cordate crenate smooth

8713 Leaves ovate, Flowers thirsoid

8714 Branches round, Leaves oblong acuminate entire, Racemes pendulous, Calyxes toothed
8715 Branches round, Leaves elliptical emarginate blunt entire, Racemes erect, Calyxes somewhat toothed
8716 Branches square, Leaves obovate pubescent beneath somewhat toothed at end, Racemes nodding
8717 Branches bluntly 4-cornered, Leaves ovate obl toothed upwards pubesc beneath Fl bracteate pendulous
8718 Branches square, Leaves ovate acuminate entire, Racemes nodding

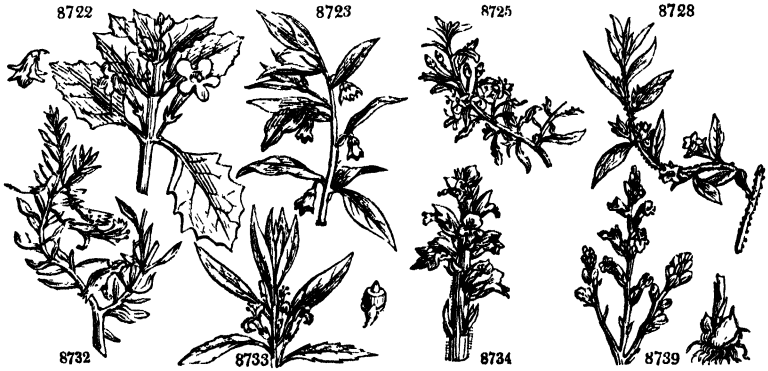
8719 Calyxes in fruit twisted, Leaves obovate oblong
8720 Calyxes in fruit erect, Leaves oblong lanceolate acuminate
8721 Spiny, Leaves 9 lines long 3 lines broad subserrate attenuated at each end, Teeth of cal shorter obtuse

and Miscellaneous Particulars.

George Volkamer, his brother, born 1616, died in 1693, wrote many academical dissertations, and a Flora o Nuremberg, which was not published till after his death The species are ornamental plants with the habit of the last genus

1327 *Holmskioldia* A Theodore Holmskiold, a Dane, published some obscure works upon Cryptogamous plants. A handsome herbaceous stove plant, remarkable for the large calyxes of a bright red color

1328 *Petrea* So called by Houstoun, in honor of Robert James Lord Petre, born in 1710, died in 1742 The famous Peter Collinson, in a letter to Linnæus, speaks of his death as the greatest loss that botany or gardening ever felt in this island A climbing plant with blue flowers.



1329. *Cithaexylum* From κιθαρα, a lyre (hence guitar), and ξυλον, wood This tree produces a wood which in America is very useful for carpenters' work It is very hard, and has been supposed applicable to making musical instruments, a mistake which arose thus, C melanocardium is called by the French *fidèle*, from its faithfulness or durability in building, the English have corrupted the name to fiddle-wood, as if it were used for making musical instruments, which is a mistake. (*Muller.*)

Cuttings root in sand under a hand-glass.

1330 *Duranta* After Castor Durantes, physician to Pope Sixtus V, author of Herbarium, 1585 died in 1590. The species grow and flower freely in loam and peat, and cuttings root in sand under a hand-glass.

8722 8723 8725 8728

8732 8733 8734 8739

History, Use, Propagation, Culture,

1331 *Pedalium* Πηδάλιον, a Greek word signifying a nail or point. This plant produces a hard and nut-like fruit with four sharp points or horns

1332 *Myoporum* From μυω, to shut up, and πορος, a pore, the spots which cover the leaves being, as it were, pores closed with some semi-transparent substance.

1333. *Stenochilus* From στενος, narrow, and χειλος, a lip, the narrow lip distinguishing this genus from some of its kindred Very pretty New Holland small shrubs, with fine red flowers

1334 *Bontia* James Bont or Bontius was a Dutch physician, born at Batavia, published in 1658, a natural history of the East Indies, in the manner of Piso A South American plant, with the appearance of a Daphne. The leaves are alternate, fleshy, and crenated, and the flowers axillary

1335 *Orobanche* So called from ορος, a vetch, or other leguminous plant, and αγχω, to strangle, in allusion to the well known effect of these parasites in destroying the plants upon which they grow The species are fleshy herbs of a russet color, fastening themselves to the roots of other plants, and chiefly to Leguminosæ The root is tuberous, imbricate with scales, and sends out fibres into the soil, the stem is without leaves, scaly, and generally simple the flowers are in terminating spikes The whole plant is acrid and astringent, and rejected by all animals, excepting the minuter tribes of Cimices and Thripses

O major adheres to the root of broom, furze, and clover, and is particularly destructive to the latter, especially in Flanders, where in some places it deters the farmer altogether from the culture of clover. It has a large, thick, fleshy, oval, scaly root, sometimes bulbous, and sending out fibres which are very brittle. The bulb adheres to the woody roots of furze or broom, and the fleshy root of clover, and the fibres clasp round them

O. elatior is commonly found adhering to the roots of Centaurea scabiosa and Trifolium pratense It does

8722 Leaves truncate, Flowers with a strong smell of musk

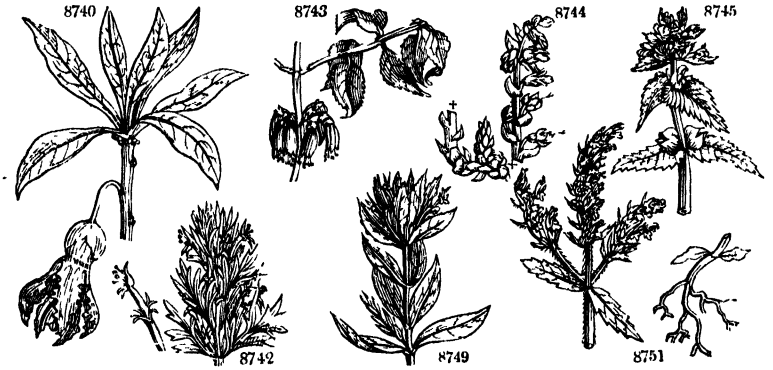
8723 Leaves elliptical bluntish mucronate and branches smooth, Sepals lanc very acute, Orifice of cor villo is
8724 Leaves broadish lanc. acumin very acute and branches smooth, Sepals ovate lanc Limb of cor bearded
8725 Lvs lin bluntish sometimes toothed at end with the branches glandular, Peduncles occasionally 2-parted
8726 Leaves lanceolate acute serrated and branches warted with glands
8727 Leaves elliptical acute serrated reflexed and branches viscid with glands
8728 Leaves lanc toothed at end entire at base, Drupes compressed shorter than calyx, Stem prostrate
8729 Leaves lanceolate at base with recurved teeth, Stems diffuse glandular, Peduncles solitary
8730 Leaves serrate cordate sessile

8731 Leaves lanceolate or elliptical entire sometimes toothed at end, Branches downy, Stem diffuse
8732 Stem silky, Leaves spatulate lanceolate much shorter than flower, Stamens a little protruded

8733 Leaves alternate, Peduncles 1-flowered

8734 Stem simple, Cor 4-fid inflat Stam naked downw Stigma 2 lobed, Lobes distant, Style pubesc upwards
8735 Stem simple, Cor 4-fid, Stamens hairy downwards, Stigma obcordate, Style smooth upwards
8736 Stem simple, Cor 4-fid, Stamens hairy downwards, Stigma retuse, Style smooth upwards
8737 Stem simple, Corolla tubular, Segm of lip blunt equal, Stamens fringed on one side at base
8738 Stem nearly simple, Cor 5-fid, Bractes 3, Calyx tubular half 4 cleft
8739 Stem branched, Cor 5-fid, Bractes 3, Calyx short deeply 4-cleft

8740 Leaves cuneate lanceolate close together
8741 Leaves ovate subcoriaceous separate, Fruit ovate acuminate



8742 Leaves at end palmate-cut, Flowers sessile

8743 Leaves ovate acuminate serrate, Corollas 2-lipped, Calyx 3-leaved, Stamens exserted

8744 Stem quite simple, Corollas pendulous with the lower lip trifid

8745 Upper lip of corolla emarginate 2-toothed, Middle segment of lower lip very short
8746 Upper lip of corolla compressed shorter, Calyxes villous
8747 Lower lip of cor longer than upper, Middle segm blunt longer than lateral, Cal vill Lvs deeply toothed

8748 Leaves alternate linear 2-toothed on each side
8749 Leaves alternate lanceolate entire, Floral oval toothed
8750 Upper leaves alternate serrated, Flowers distant lateral
8751 Leaves linear lanceolate serrated, Segm of lower lip of corolla blunt
8752 Leaves opposite cordate bluntly serrated

and Miscellaneous Particulars

not appear among clover till the second year On the borders of corn-fields it is found on Centaurea scabiosa and nigra, Scabiosa arvensis, &c

O minor also adheres to common red clover and to Hypochæris radicata. O ramosa is found on Galeopsis tetrahit. Any of the species may be removed to the garden and planted by the whin or broom

1336 *Crescentia* In memory of Pietro Crescenti, of Bologna, author of various agricultural works in the thirteenth century The fruits after the inside has been scooped out, are dried by the natives of the countries where they grow, and serve for containing water or other fluids.

1337 *Castilleja.* Named after one Castillejo, a Spanish botanist and friend of Mutis Some of the species of this genus which have not yet been introduced, are very beautiful plants, and would amply repay a collector for his trouble in procuring them.

1338 *Halleria* After the famous Albert Haller, author of Stirpes Helveticæ, and other considerable works on botany and medicine. A pretty stove plant, with long branches of red flowers. Surely so eminent an investigator of alpine vegetation as Haller was, should have had an alpine genus consecrated to him

1339 *Lathræa* Λαθραιος, concealed The plant is only found in the most hidden recesses of the grove A curious humble parasite without leaves, in the room of which it is covered with abundance of white fleshy scales

1340 *Rhinanthus* From ῥις, a nose, and ανθος, a flower, because of its ringent corolla compressed, at the upper lip so as to resemble the snout of some animal

1341 *Bartsia* Named by Linnæus, in honor of his beloved friend John Batsch, M D, of whom he gives an interesting and melancholy account in his Flora Suecica. Curious herbaceous plants of very difficult cultivation.

History, Use, Propagation, Culture,

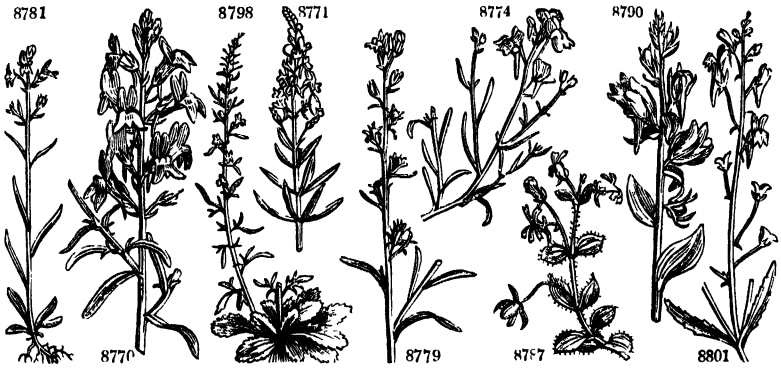
1342. *Euphrasia* An abridgment of *Euphrosine*, the name of a woman, expressing joy or pleasure This has been so called from the joyful effects of E officinalis in disorders of the eyes, but it is now thought to be injurious rather than otherwise Lightfoot states, that the Scotch Highlanders make an infusion of it in milk, and anoint the patient's eyes with a feather dipped in it

1343. *Antirrhinum.* From *αντι*, similar, and *ρις*, a nose, because the flowers of most of the species bear a perfect resemblance to the snout of some animal A majus and its varieties are popular border flowers of the easiest culture in any dry soil, the other species are also pretty little plants

1344 *Linaria.* The plant out of flower is very similar to Linum, Flax The species are for the most part pretty annual plants; and some of them, as L Cymbalaria, well adapted for growing in pots or for rock-work.

8753 Leaves ovate bluntly toothed, Segm of lower lip of corolla emarginate
8754 Leaves linear serrated upper entire, Lateral segments of lower lip of corolla toothletted
8755 Leaves ovate toothed palmate, Flowers spiked, Cor tubular, Segm of lower lip blunt

8756 Leaves lanceolate opposite, Flowers racemose, Sepals glandular hairy ovate blunt



8757 Leaves linear lanceolate ternate, Flowers racemose, Sepals glandular hairy lanceolate acute
8758 Leaves lanceolate upper alternate, Flowers subsessile, Calyxes longer than corolla
8759 Leaves opposite cordate unequally crenate somewhat lobed hairy, Stems procumbent
8760 Leaves opposite ovate downy, Stems procumbent

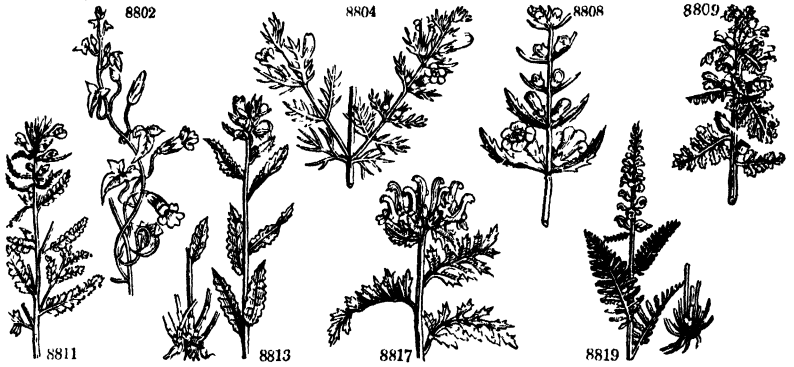
8761 Leaves cordate 5-lobed alternate smooth, Stems procumbent
8762 Small, Leaves reniform repand very hairy alternate, Stems procumbent
8763 Leaves hastate alternate, Stems procumbent
8764 Leaves hairy alternate roundish ovate, lower obsoletely toothed upper subsessile entire, Stem procumb.
8765 Leaves hastate alternate, Stems spreading, Petioles occasionally producing tendrils
8766 Leaves hastate alternate, Stem erect much branched, Peduncles staff
8767 Leaves ternate ovate blunt 3-nerved rough at edge, Spike terminal, Flowers stalked
8768 Leaves ternate ovate lanceolate 3-nerved, Spike terminal, Flowers sessile
8769 Ivs whorled lanc 3-nerved, Stems decumbent, Raceme terminal few-flowered, Cor very large stalked
8770 Leaves linear lanceolate lower opposite, upper alternate, Racemes lax, Helmet erect 2-parted
8771 Leaves 4 linear lanceolate, Flower-stem erect spiked
8772 Leaves linear lanceolate lower ternate, Stem erect spiked
8773 Root creeping, Leaves linear close lower 4, Calyx as long as capsule
8774 Leaves subulate channelled fleshy lower 3, Stem panicled and corolla quite smooth
8775 Leaves linear smooth lower 4, Stem erect panicled, Flowers in capitate spikes
8776 Leaves linear lanceolate lower about 4 smooth, Flowers capitate, Calyxes hairy, Stem nearly simple
8777 Leaves linear scattered lower opposite, Spur subulate, Flowers subsessile
8778 Leaves about 4 linear, Stem diffuse, Flowers racemose, Spur straight
8779 Leaves nearly linear · lower in fours, Calyxes pilose viscid, Fl racemose, Spur straight, Stem erect
8780 Leaves nearly linear lower in fours, Calyxes pilose viscid, Fl racemose, Spur recurved, Stem erect
8781 Cauline leaves linear alternate radical ovate lanceolate 3-5, Flowers corymbose
8782 Cauline leaves linear alternate radical lanceolate 4, Cal villous close to stem
8783 Leaves 5 linear fleshy, Flowers capitate
8784 Leaves linear channelled scattered upon the rootshoots in 5s, Calyx hairy, Pedunc shorter than bractes
8785 Leaves 4 subulate fleshy, Stems erect, Flowers spiked
8786 Leaves 4 linear lanceolate glaucous, Stem diffuse, Flowers racemose, Spur straight
8787 Leaves all opposite villous, Stem simple, Flowers opposite lateral
8788 Leaves obovate opposite floral alternate, Stem ascending pubescent, Spur straight
8789 Leaves mostly alternate lanceolate blunt, Stem much branched diffuse
8790 Leaves somewhat stem-clasping lanceolate scattered, Bractes longer than calyx, Stem ½ shrubby
8791 Leaves lanceolate hairy alternate, Flowers spiked upper sepal very large
8792 Leaves alternate linear-subulate somewhat fleshy, Stem erect simple, Spike term stalked
8793 Leaves lanceolate acuminate, Panicle twiggy flexuose
8794 Leaves linear alternate, Stem panicled twiggy, Flowers racemose
8795 Leaves lanceolate linear close, Stem erect, Spikes terminal sessile, Flowers imbricated

8796 Leaves alternate linear remote sinoote, Flowers racemose, Stem simple, Runners procumbent
8797 Leaves linear lanceolate alternate, Flowers racemose, Cal longer than cor. Stem erect

8798 Very smooth, Radical leaves obovate lanceolate blunt serrate. cauline divided entire

8799 Leaves ovate serrated stalked, Peduncles axillary 1-flowered
8800 Leaves 4 linear lanceolate acute about 3-nerved smooth, Flowers racemose terminal with bractes
8801 Leaves oblong serrated, Stem erect herbaceous, Capsules 2-horned spreading

and Miscellaneous Particulars.



L. triphylla is a popular border annual. L. triornithophora is remarkable for the form of its flowers, which resemble three little birds seated in the ajar.

L. vulgaris is a very showy plant, but also a bad weed in sandy pastures.

1345 *Anarrhinum* Named by Desfontaines, from *α*, privative, and *ῥὶν*, nose, in contradistinction to Antirrhinum, because the plants of this genus have not the snout-like flowers of the latter. Plants resembling Linaria in habit.

1346. *Nemesia* A name used by Dioscorides to designate a kind of Antirrhinum, to which genus this is nearly related.

History, Use, Propagation, Culture,

1347 *Maurandya* Named in honor of the lady of Dr Maurandy, the botanical professor at Carthagena. An elegant greenhouse plant, native of Mexico, and flowering for months together in the summer

1348 *Gerardia.* In honor of John Gerarde, our old English botanist, author of the Herbal, 1597, folio, and a great cultivator of exotic plants, of which he published a catalogue in 1596 These are handsome North American herbaceous plants, of such very difficult culture, that few persons have seen them in gardens They deserve any pains which may be necessary to their successful cultivation

1349 *Pedicularis*, of which the English word *lousewort* is a translation and explanation The term lousewort is applied from a supposition that sheep which feed much on the plant become lousy; probably because the plants grow in very bad pastures, which may occasion the sheep to be in bad condition and to breed vermin The species have their leaves very much cut, and that in a very regular manner Their flowers are red, white, or yellow, and the mixture or shades of these three colors sometimes give the corolla the colour of fire They grow in general at a considerable elevation, namely, more than a thousand toises above the level of the sea

P sceptrum Carolinum was so named by Rudbeck, in honor of Charles XII It abounds in the north of Sweden and Lapland, where it was greatly admired by the traveller Dr Clarke, who sent seeds of it to the Cambridge botanic garden, but they never came to any thing The flowers grow in long whorled spikes, and

8802 Orifice of corolla pervious
8803 Orifice of corolla closed

8804 Leaves linear pinnatifid, Stem somewhat branching
8805 Stem oppositely much branched, Leaves linear, Flowers axillary opposite subsessile

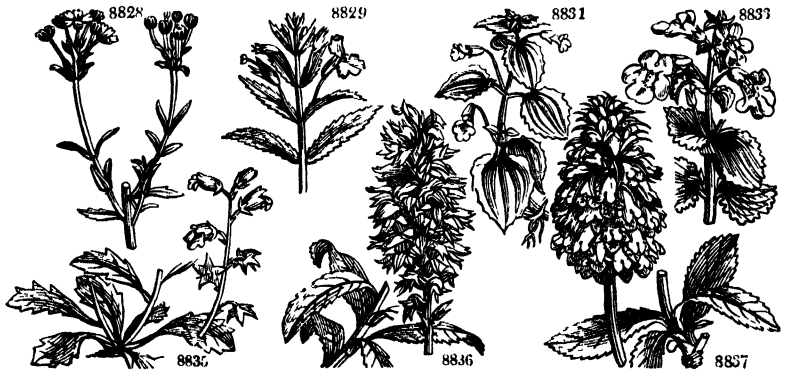
8816 Stem simple, Cauline leaves deeply pinnatifid, Pinnæ lanc acuminate pinnatifid toothed, Spike leafy
8817 Stem simple, Spike somewhat leafy, Helmet setaceous 2-toothed, Cal truncate downwards
8818 Stem simple, Leaves deeply pinnatifid, Pinnæ unequally toothed linear-lanc Calyxes villous 5-cleft
8819 Stem simple, Cauline lvs deeply pinnatifid, Pinnæ lin lanc doubly toothed, Cal round smooth 5-toothed
8820 Stem simple, Cauline leaves pinnatifid in fours, Pinnæ oblong blunt toothed, Spike capitate, Cal hairy
8821 Stem simple, Lvs. pinnated, Pinnæ imbricated ovate blunt doubly toothed, Cal 5-toothed, Helmet blunt
8822 Stem simple, Lvs pinnated, Pinnæ deeply pinnatifid tooth Cal 5-fid somew crested, Helmet uncinate
8823 Stem simple, Lvs pinn Pinnæ lanc. pinnatifid confluent at end, Spike capitate naked Calyx emargi.
8824 Stem simple, Lvs. pinnate, Pinnæ pinnatifid somewhat toothed, Spike leafy, Helmet two-toothed

8825 Leaves cæspitose spatulate deeply serrated smoothish, Peduncles terminal subcorymbose
8826 Smaller branched villous, Leaves bluntly serrated, Flowers racemose
8827 Leaves lanceolate oblong toothed, Segm of limb entire
8828 Leaves lanceolate smooth serrated at end, Stem herbaceous, Segm of limb bifid



8829 Leaves lanceolate acuminate smooth sessile, Pedunc longer than flower
8830 Leaves oblong bluntish clammy sessile, Peduncles shorter than flower
8831 Procumb. Stem round rooting hairy, Lvs cord-ovate toothed 5-nerved, Pedunc shorter than petioles
8832 Leaves ovate stalked, Stem square winged
8833 Leaves roundish ovate nerved, lower stalked, Stem creeping

8834 Leaves obovate entire at base, Calyxes spreading and peduncles smooth

8835 Raceme lax longer than the few-leaved stem, Calyxes pubescent in fruit increased in size

8836 Segments of cor acute

8837 Segments of corolla blunt, Raceme comose

and Miscellaneous Particulars

each represents a lion couchant All the species are extremely difficult to keep in gardens According to Sweet, they succeed best in peat soil and moist situations, the more tender species must be grown in pots in the same kind of soil, and should be protected under frames in severe weather: the best way of increasing them is by seed (*Bot Cult* 404)

1350 *Erinus* A name under which Dioscorides describes an aquatic plant with a white flower, black seeds, and a milky stem. From the last circumstance it has derived its name, ερινεος signifying a wild fig tree. The plant of the ancients had no resemblance to that called Erinus by the moderns Beautiful little alpine herbaceous plants, well adapted to rock-work in warm damp situations

1351. *Mimulus.* From μιμεω, an ape The flower seeds in front resemble the face of a grinning monkey The species are showy plants of the easiest culture in almost any soil or situation.

1352 *Hornemannia* Named after Professor Hornemann, of Copenhagen, an eminent botanist, and the present editor of the Flora Danica. Little, inconspicuous, but curious annual plants

1352 *Mazus* From μαζος, a teat, on account of the little protuberances which close the mouth of the corolla. East Indian herbaceous plants, not unlike some kinds of Antirrhinum

1354. *Isoplexis.* From ισος, equal, and πλεξις, segment, in allusion to the equal-sized divisions of the corolla.

History, Use, Propagation, Culture,

1347 *Maurandya.* Named in honor of the lady of Dr Maurandy, the botanical professor at Carthagena. An elegant greenhouse plant, native of Mexico, and flowering for months together in the summer

1348 *Gerardia.* In honor of John Gerarde, our old English botanist, author of the Herbal, 1597, folio, and a great cultivator of exotic plants, of which he published a catalogue in 1596 These are handsome North American herbaceous plants, of such very difficult culture, that few persons have seen them in gardens They deserve any pains which may be necessary to their successful cultivation

1349 *Pedicularis*, of which the English word *lousewort* is a translation and explanation The term lousewort is applied from a supposition that sheep which feed much on the plant become lousy; probably because the plants grow in very bad pastures, which may occasion the sheep to be in bad condition and to breed vermin The species have their leaves very much cut, and that in a very regular manner. Their flowers are red, white, or yellow, and the mixture or shades of these three colors sometimes give the corolla the colour of fire They grow in general at a considerable elevation; namely, more than a thousand toises above the level of the sea

P sceptrum Carolinum was so named by Rudbeck, in honor of Charles XII It abounds in the north o Sweden and Lapland, where it was greatly admired by the traveller Dr. Clarke, who sent seeds of it to the Cambridge botanic garden, but they never came to any thing The flowers grow in long whorled spikes, and

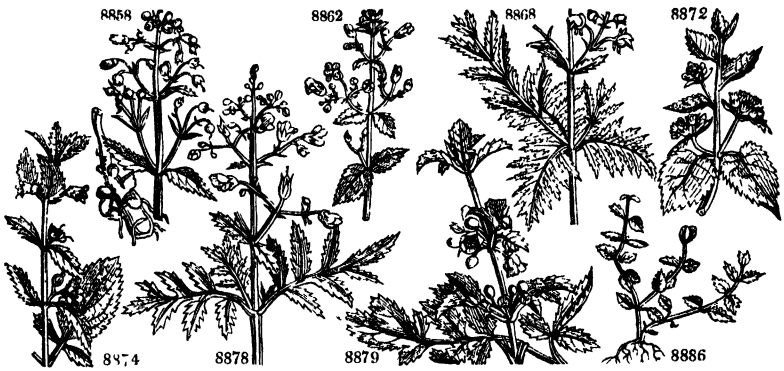
History, Use, Propagation, Culture,

1355 *Digitalis* Named by Fuchs, from *digitabulum*, a thimble, in allusion to the form of the flowers The species are for the most part showy border flowers of easy culture D purpurea, found both with purple and white flowers, is one of the most ornamental of native plants in rocky copses, neglected hedges, and by road sides Its large tall spike attracts not only the botanist and florist, but is even conspicuous enough to be introduced in the painter's landscape of such scenery It is a violent poison, but also a valuable plant in medicine The leaves are the parts of the plant used They should be gathered when the plant is in flower, and those only which are fresh selected The leaf-stalks and midrib should be rejected, and the remaining part be dried either in the sunshine, or on a tin-pan or pewter dish before the fire, or the plant be hung up, each leaf separate, in a warm kitchen Practitioners ought annually to obtain a supply of the recent leaves in the month of July, and dry them themselves, as in the herb-shops they are often so ill dried as to appear black, in which state they are useless The powder should be kept in closely stopped opaque phials



Digitalis is directly sedative and diuretic It weakens the force of all the vital functions, and by a proper exhibition of it, the frequency of the pulse may be diminished any number of pulsations, and regulated at the pleasure of the practitioner, whilst at the same time it admits, to a certain extent, of the employment of such medicines as increase the firmness of the arterial action, and give tone to the habit. When given to the

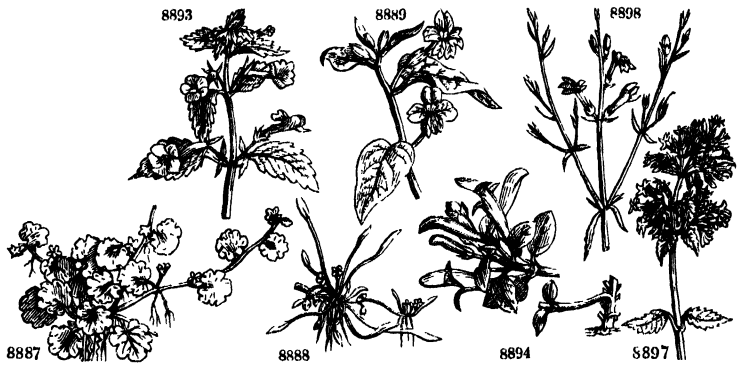
8842 Lvs ov lanc. acum toothed and stem villous, Bractes twice as long as lower flowers, Cor villous netted
8843 Lvs. lanc ciliated, Bractes twice as short as flowers, Cor downy netted, Segm ov acute, Lip bearded,
8844 Very smooth branched, Lvs. lin lanc Flowers scattered not downy [Stamens as long as tube
8845 Raceme dense pyramidal, Sepals edged, Lip of corolla ovate entire bearded
8846 Raceme many-flowered, Sepals edged, Corolla bowed, Lip ovate 3-toothed
8847 Raceme dense cylindrical many-fl Lip of cor crawed lunate, Bractes linear longer than flower
8848 Leaves oblong, Rachis woolly, Lip of cor ovate
8849 Very smooth, Leaves linear, Flowers scattered, Lips of cor oblong
8850 Lvs obl lanc wavy deflexed ciliated entire, Raceme dense cylindrical, Segm and sepals of cor rounded
8851 Glandul hairy, Lvs. obl lanc rugose wavy tooth Raceme 1-sided many-fl Cor pubesc Segm. ov glandul.
8852 Lvs linear lanc serrated smooth, Raceme 1-sided, Cor smooth, Segments rounded
8853 Segm. of cor. ovate obtuse, Flowers of distinct sexes [flowers
8854 Lvs lanc toothed smooth, Raceme 1-sided, Cor smooth segm ov bearded, Lower bractes longer than
8855 Lvs cordate oblong flat crenate not downy, Raceme 1-sided, Cor smooth, Segm. very blunt
8856 Half shrubby, Leaves linear lanc. entire smooth, Corollas ventricose

8857 Leaves cordate serrate acute rounded at base, Stem with blunt angles
8858 Leaves cordate 3-nerved, Stem with blunt angles
8859 Leaves cordate stalked decurrent blunt, Stem with membranous angles, Racemes terminal
8860 Lvs ovate cord. smooth cut serrate with appendages at base, Petioles dilated, Racemes term compound
8861 Lvs obl. cord hairy beneath doubly toothed with an appendage at base, Petioles equal, Racemes terminal
8862 Leaves cordate doubly serrate pubescent, Panicles terminal trichotomous with leaves between
8863 Lvs obl lanc cord doubly serrated smooth, Panicles racemose terminal 3-chotomous, Stem ½ shrubby
8864 Leaves cordate obl. toothed teeth entire those at base deepest
8865 Leaves obl lanc deeply cordate finely and doubly serrated smooth, Pan racem term Ped 3-chotomous
8866 Lower lvs tern cord cren toothed, upper entire, Fl racemose paniced, Bractes ovate lanc. entire at end
8867 Leaves cordate 3-nerved pubesc on each side, Petioles ciliated, Pedunc and bractes with glandular hairs
8868 Leaves lanceolate serrated stalked cauline in 3s, and the branches opposite
8869 Lvs lanc narrowed at each end deeply unequally and doubly toothed smooth, Racemes terminal
8870 Lvs somew fleshy upper sessile toothed smooth recurved at end, Pan racem Pedunc bifid many-flow
8871 Lvs cord doubly toothed lower teeth bent backwards, Raceme terminal compound, Ped 2-3-fl altern.
8872 Leaves cordate pubescent doubly serrated, Panic axillary dichotomous, Bractes ovate serrate
8873 Leaves cordate smooth doubly serrated, Panic axillary dichotomous, Capsules acuminate
8874 Leaves smooth lower ternate pinnate blunt, upper simple, Pedunc about 3-fl axillary
8875 Leaves interruptedly pinnate cordate unequal, Raceme terminal, Pedunc axillary twin dichotomous
8876 Lvs obl cord lobed at edge naked as long as pet Rac term comp Branch and ped with glandular hairs
8877 Lvs interruptedly pinnate oblong subcordate unequal at base, Panicle terminal, Pedunes dichotomous
8878 Leaves pinnated, Leaflets oblong cut toothed, Panicle terminal, Peduncles dichotomous
8879 Leaves smooth lower interruptedly pinnate, upper ternate, Leaflets oblong, Flowers axillary
8880 Leaves pinnated, Raceme terminal naked, Peduncles bifid, Calyxes scarious
8881 Lower leaves bipinnate somewhat fleshy very smooth, Racemes bipartite
8882 Stems woody at base, Leaves bipinnatifid pubescent, Racemes long, Pedicels short villous
8883 Leaves bipinnate, Pinnæ acutely cut toothed, Panicle terminal, Pedunele dichotomous
8884 Lvs smooth rad bipinnat caul pinnate, Panicle leafy, Ped dichotomons, Lat seg of lower lip emargin
8885 Leaves cordate lined shining, Pedunc axillary 2-flowered, Stem hexangular

8886 Leaves roundish subsessile

and Miscellaneous Particulars



full extent of which the system can admit, the pulse intermits, and vertigo, indistinct vision, and nausea, with vomiting or purging, occur, and if, after these indications, the quantity be still increased, or if any considerable portion of the recent herb be inconsiderately swallowed, it produces delirium, hiccough, cold sweats, convulsions, syncope, and death (*London Dispensatory*, 287)

1356 *Scrophularia*. So named from the roots having a resemblance to *scrophulous* tumours, which they were, by the peculiar mode of induction of the dark ages, therefore supposed to cure S nodosa has the name of figwort from its knobbed roots it has a rank smell like elder, and a bitter taste, swine that have the scab are cured by washing them with a decoction of the leaves Wasps resort greatly to the flowers Goats eat the plant, but cows, horses, sheep and swine refuse it

The same observations apply to S aquatica, which in French is called *Herbe du Siege*, because at the celebrated siege of Rochelle by Cardinal Richelieu in 1628, the garrison was reduced to the necessity of supporting life upon the roots of the plant.

1357 *Vandellia* Louis Vandelli, a Portuguese, was professor of botany in the garden of Coimbra He published in 1788, an essay on the plants of Portugal and Brazil, a work which is little known, on account of its extreme rarity.

History, Use, Propagation, Culture,

1358. *Sibthorpia* In honor of Humphry Sibthorp, M D, professor of botany at Oxford, who travelled into Greece, for the purpose of collecting materials for a classical Flora Græca, in which he succeeded even beyond his own hopes After his death the publication of his materials was confided to Sir James Edward Smith, under whose care the work has reached to five hundred figures in folio, of the most magnificent kind, five hundred more have yet to be published A little trailing plant

1359 *Limosella.* From *limus*, mud The plant grows by the edge of puddles and in muddy places

1360 *Browallia.* Named by Linnæus, in honor of John Browallius, bishop of Aboa, who defended the sexual system against Siegesbeck, in a book entitled Examen epicriseos, &c, Aboa, 1739, octavo Handsome plants with blue flowers, often cultivated as tender annuals

1361 *Stemodia* From στημων, a stamen, and δις, double Each of the stamens supports two anthers.

1362 *Trevirana* Named after Dr Treviranus, a German botanist. This beautiful plant, which is commonly called Cyrilla pulchella, is one of the prettiest of the old inhabitants of the stove

1363 *Columnea.* In honor of Fabius Columna, or Fabio Colonna, of the noble family of Colonna in Italy, born in 1567 He published his Phytobazanos in 1592, and his Ecphrasis in 1606, both works of high reputation in their day One species, C scandens, is common in hothouses, where it is cultivated for the neatness of its foliage and the beauty of its scarlet blossoms

8887 Leaves reniform subpeltate crenate

8888 Leaves lanceolate spatulate, Scapes shorter than leaf

8889 Peduncles 1-flowered
8890 Peduncles 1 many-flowered

8891 Leaves opposite and ternate stalked
8892 Leaves opposite and ternate stem-clasping

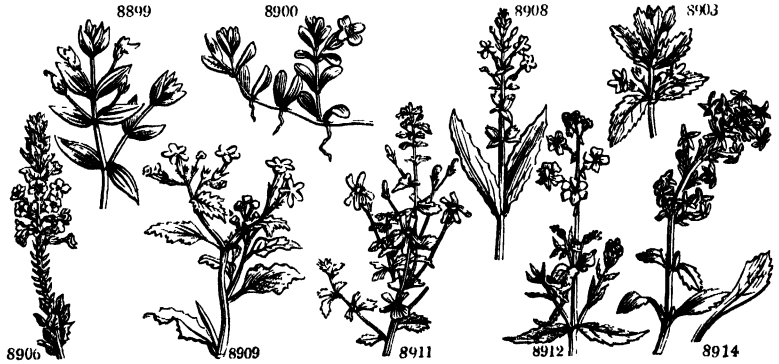
8893 Leaves ternate ovate hairy

8894 Leaves ovate acute entire subvillous, Sepals entire and corollas pubescent, Upper lip undivided
8895 Leaves ovate acuminate serrate hairy above, Sepals toothletted and corollas hairy
8896 Leaves 3 subsessile oblong acutely crenate pubescent, Cor hairy, Galea dilated reflexed

8897 Leaves ovate acuminate stalked, Raceme terminal whorled, Peduncles cymose

8898 Leaves linear smooth entire, Stem nearly naked

8899 Leaves oblong ovate entire 3-nerved sessile, Pedunc axillary 1 flowered, Stem procumbent



8900 Leaves oblong entire, Peduncles longer than leaf, Stem declinate
8901 Very smooth, Leaves cuneate oblong upwards obsoletely crenate, Pedunc nearly as long as leaf
8902 Stem erect, Leaves lanceolate acute doubly serrated smooth, Flowers whorled

8903 Leaves ovate serrated alternate, Flowers twin
8904 Hairy, Leaves alternate rhomboid cuneiform cut serrate, Flowers twin, Sepals linear
8905 Leaves opposite linear entire, Racemes compound terminal
8906 Leaves opposite ovate-oblong entire wavy upper subcordate whorled, Racemes spiked
8907 Pubescent, Leaves opposite and ternate ovate serrate stalked, Pedunc axillary shorter than petiole

8908 Leaves toothed lanceolate 3-nerved

8909 Leaves opposite ovate jagged, Flowers somewhat umbelled terminal
8910 Leaves linear toothed villous, Cal hairy, Branches subfastigiate

8911 Upper leaves opposite sessile tooth-sinuated, Flowers solitary on long stalks
8912 Leaves opp lin lanc acute at each end toothletted, Raceme terminal, Stamens exserted
8913 Leaves lanc toothed villous, Racemes of flowers remote
8914 Leaves obovate crenate downy, Stem decumbent
8915 Leaves obl serrated hairy, Stem nearly leafless, Flowers alternate remote
8916 Leaves ovate toothed silky beneath dotted with silver, Flowers axillary stalked
8917 Leaves wedge-shaped serrated pubescent, Segm of cor with very long points
8918 Leaves opp stalked oblong blunt tooth-serrated when old smooth, Segm of cor rounded

and Miscellaneous Particulars

1364 ***Russelia.*** In honor of Alexander Russel, M D F R S, born in Scotland, died 1768, author of the natural history of Aleppo, London, 1756 His brother Patrick, published a second edition in 1794, and a work on serpents in 1796, folio

1365 ***Dodartia,*** by Tournefort, after M Dodart, member of the academy of sciences at Paris, and an eminent physician An ugly, leafless, almost flowerless plant, of much rarity and little beauty

1366 ***Lindernia*** Named after Francis Lindern, an obscure Swiss botanist Pyxidaria is so called from πυξος, the box, which it resembles in foliage

1367 ***Herpestis*** From ἑρπης, any thing which creeps. An exotic genus of herbs, with opposite leaves and axillary flowers, each of whose stalks bears a pair of bracteæ Herpestis Monnieria is a beautiful aquatic

1368 ***Capraria*** So named from *capra*, a goat, the leaves being much liked by that animal

1369. ***Buchnera*** Named after John Godfrey Buchner, a German botanist, who published in 1743, his Observations upon the Plants of Saxony Small Cape shrubs of little interest or beauty Their leaves are generally small, and their flowers white

1370 ***Manulea*** Derived from *manus*, the hand The five divisions of the flower, *in some species*, from their form and relative position, resemble an open hand Handsome Cape shrubs of humble growth They are rare in collections, but deserving of being very generally cultivated

History, Use, Propagation, Culture,

1371 *Angelonia* *Angelon* is the name of the plant among the Spanish colonists of Caraccas, where it grows. A very beautiful stove herbaceous plant, with large light-blue flowers

1372 *Schizanthus* From σχίζω, to cut, and ἄνθος, a flower, in allusion to the numerous divisions of the beautiful purple and yellow flowers Tender annual plants, with finely cut pale green leaves, and terminal panicles of elegant flowers

1373 *Besleria* After Basil Besler, an apothecary at Nuremberg, joint editor with Jungermann, of a sumptuous work entitled Hortus Evstettensis, 1613. The garden belonged to Bishop Conrad, of Eichstedt, and the plates were engraved at his expense

1374 *Tledia* So named by Persoon, but the meaning is unknown Pretty herbaceous plants, with bright purple flowers and dark berries

1375 *Brunsfelsia* In memory of Otho Brunsfels, of Mentz, a Carthusian monk, and afterwards a physician, author of Figures of Plants in 1530 He died in 1534 The species are handsome tropical shrubs, with neat foliage and showy white or purple flowers Cuttings with a little ripened wood strike root freely in heat

8919 The only species

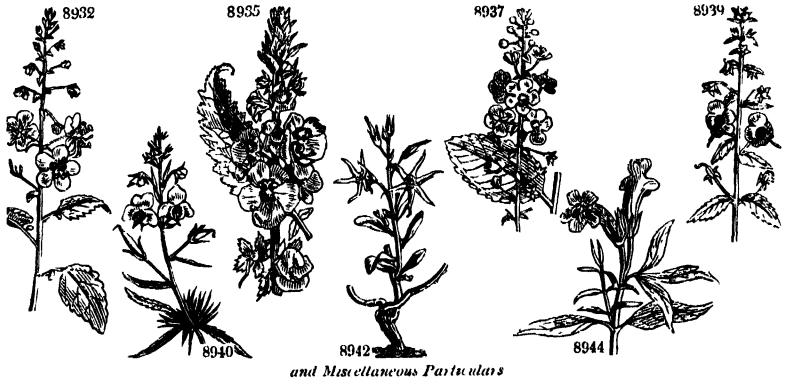
8920 The only species

8921 Peduncles branched, Leaves ovate
8922 Peduncles simple clustered, Leaves ovate-lanceolate serrated
8923 Peduncles simple solitary, Calyxes serrated, Cor smooth with a serrulated limb
8924 Leaves obl ovate rugose crenate decurrent down the petiole, Cal serrulate colored
8925 Peduncles simple solitary, Calyxes colored serrated, Cor. hairy with an entire limb, Leaves ovate

8926 Leaves opp obl finely serrulate smooth
8927 Leaves downy

8928 Leaves ovate-lanceolate narrowed at each end, Tube of cor curved, Limb wavy
8929 Leaves obovate acuminate longer than petiole, Tube of cor straight, Limb entire

8930 Leaves and leafstalks deeply stained with purple



8931 Cauline leaves bipinnate
8932 Rad leaves lyrate upper oblong, Pedicels longer than bractes, Sepals linear entire
8933 Radical leaves lyrate upper ovate, Bractes longer than pedicels, Sepals linear oblong entire
8934 Radical leaves lyrate floral cordate half stem-clasping, Peduncles as long as flower
8935 Radical leaves lyrate upper oblong, Flowers subsessile the length of bractes, Cal ovate serrated
8936 Somewhat downy, Leaves lanceolate, Flowers axillary solitary
8637 All over wool, Leaves oval oblong blunt crenate, Stamens bearded with capitate hairs

8938 Leaves ovate lanceolate deeply serrated
8939 Leaves ovate acute cut serrated

8940 Leaves ternate remotely toothletted
8941 Leaves ovate acute serrated, Stem winged at angles

8942 Leaves obovate smooth, Segments of cor length of tube
8943 Leaves obovate dotted with glands downy

8944 Flowers large yellow spotted

and Miscellaneous Particulars

1376. *Celsia* In honor of Olaus Celsius, D D, surnamed the northern Pliny, professor of the oriental languages in the university of Upsal His Hierobotanicon, or History of the Plants of Scripture, appeared in 1745 There was also another Swedish botanist called Magnus Nicolaus Celsus, who died in 1679. Besides these moderns, the name is rendered familiar to classical scholars by the recollection of the famous Aurelius Cornelius Celsus, who wrote upon agriculture and medicine, and whose purity of style procured him the name of the Cicero of medicine

1377 *Alonsoa* Named by the authors of the Flora Peruviana, after Zanoni Alonso, at the time of the publication of that work, Spanish secretary for the kingdom of Santa Fé, and a great patron of objects connected with natural history Sir James Smith considers the genus the same as Hemimeris

1378 *Anthocercis* From ἀνθος, a flower, and κερκις, a ray, the narrow divisions of the corolla spreading in a radiant manner, like the spokes of a wheel

1379 *Cymbaria* From κυμβη, a boat, in allusion to the shape of the fruit A small pubescent hoary plant native of mountainous rocky places in Siberia.

Class XV. — TETRADYNAMIA. Stamens 6, of which four are longer than the rest.

This class consists, with the exception of Cleome, entirely of the natural order Cruciferæ, and has lately been the subject of the most acute and successful investigation of many botanists of celebrity. Our countryman, Mr Brown, led the way to the improvements which have been made in the genera, in the second edition of the Hortus Kewensis, in which, discarding the uncertain and unnatural characters derived from variations in the floral envelopes, he took a new course, and by indicating with great precision the curious modifications of the seeds and seed-vessels, led the way to an entirely new arrangement of the class The principles thus developed have been adopted by M Decandolle, whose learned treatise upon Cruciferæ is here followed without variation

The difference between the genera with a long pod (*Siliquosæ*), and those with a short one (*Siliculosæ*), has given rise to two orders in the Linnean system But these are not only ambiguous, but interfere so much with a distribution of the genera according to their natural affinities, that they have been rejected here, and the divisions of M Decandolle, depending upon variation in the relative position of the various parts of the seed, have been substituted

The plants of this class have always been celebrated for their antiscorbutic qualities These seem to reside in an acrid, oily, volatile principle, not yet determined by chemists, and varying in the degree of abundance in which it is found in different species It is particularly abundant in the seeds of mustard and garden rocket, in the roots of the horse radish, and in the foliage of the Lepidium latifolium, which, administered inwardly, act powerfully upon the gastric organs, or, applied externally, inflame the skin and operate nearly as severely as blisters A slighter degree of acrimony is found in the foliage of the scurvy grass, the roots of the garden radish, &c , and these, therefore, operate more gently, and perhaps more safely, when eaten, scarcely at all when applied outwardly Whatever the degree of acrimony may be in these plants, they all appear, when eaten, to produce some specific action upon the digestive organs, and thence upon scorbutic humours, for which reason, the horse radish, water-cress, radishes, and even cabbages are eminently antiscorbutic They are also admitted by physicians as diuretic, sialagogue, and diaphoretic It is only when the acrid principle is diffused over a considerable quantity of fleshy and watery substance, that cruciferous plants become eatable, as in the leaves and stems of cabbages and sea-kail, and in the roots of radishes and turnips Even in these plants, the proportion of acrid principle is much diminished by exclusion from light Plants of this class are also remarkable for containing a larger quantity of azote than most vegetables, for which reason ammonia is generally evolved in their fermentation or putrefaction to which circumstance it is possible that the two remarkable phænomena are to be attributed, viz , that cruciferous plants contain a greater portion of nutritive matter than most herbaceous plants, and that they require either a very rich soil manured with animal substances, or at least a situation near the habitations of men The embryos of all these plants are filled with oil, and the seeds of Camelina sativa, Brassica campestris, some species of Rocket, &c are cultivated in many parts of Europe for the sake of their expressed oil, which is used either for culinary purposes or for lamps

Cruciferous plants are chiefly natives of temperate climates, those which are found within the tropics being in all cases mountain plants, and are nearly all cultivable in the open air, they are mostly found in open sandy plains, some on the tops of the highest mountains at the utmost limits of vegetation Nine hundred species are now described, of which not more than twenty-two are to be found in the works of Hippocrates, Theophrastus, Dioscorides, or Pliny

A *Cotyledons four, spirally twisted Petals* 4, *cruciate*

1380 *Schizopetalon* Petals pinnatifid

B *Cotyledons two. Petals* 4, *cruciate*

1 *Cotyledons flat, accumbent Radicle lateral Seeds compressed* (O=) Pleurorhizæ, *Dec*

* *Silique opening, with a linear dissepiment more or less wide than seeds Seeds oval, compressed, often margined Cotyledons flat, accumbent, parallel with the dissepiment* Arabideæ, *Dec*

1381 *Mathiola.* Silique roundish Stigmas connivent, thickened or cornute at back Calyx bisaccate at base

1382 *Cheiranthus* Silique round or compressed Stigmas 2-lobed or capitate Calyx bisaccate at base

1383 *Nasturtium* Silique roundish, shortened or declinate Stigma nearly 2-lobed Calyx equal at base, spreading

1384 *Leptocarpæa* Silique roundish, very slender Stigmas sessile, 2-lobed Calyx spreading, equal

1385 *Notoceras* Silique 4-cornered, 2-edged, the valves elongated at end into a horn or mucro

1386 *Barbarea* Silique 4-cornered, 2-edged, the valves not elongated at end Calyx equal at base

1387 *Braya* Silique oblong, subcylindrical, with flattish valves and a sessile stigma Seeds few, ovate Calyx equal at base

1388 *Parrya* Silique linear with veiny valves Seeds in two rows, with a loose wrinkled skin Stigmas approximating Filaments not toothed

1389 *Turritis* Silique linear with flat valves Seeds in two rows in each cell

1390 *Arabis* Silique linear with flat valves, 1-nerved in the middle Seeds in one row in each cell.

1391 *Macropodium* Silique pedicellate, linear, with five valves, 1-nerved in middle

1392 *Cardamine* Silique linear with flat nerveless valves, often opening with elasticity Funicles of the hilum slender

1393 *Pteroneuron* Silique lanceolate with flat nerveless valves, often opening with elasticity placentas with winged nerves Funicles dilated

1394 *Dentaria* Silique lanceolate with flat nerveless valves, often opening with elasticity · placentas not winged. Funicles dilated

** *Silicle opening lengthwise, with a broad oval membranous dissepiment, and flat or concave valves. Seeds compressed, frequently margined Cotyledons flat, accumbent, parallel with the dissepiment* Alyssineæ, *Dec.*

1395 *Lunaria* Silicle pedicellate, elliptical or lanceolate with flat valves Funicles long, adhering to the dissepiment Calyx somewhat bisaccate Petals nearly entire. Stamens not toothed

1396 *Ricotia.* Silicle sessile, oblong, when ripe losing its dissepiment and becoming 1-celled: valves flat. Calyx with two prominences at base Petals emarginate Stamens not toothed.

1397 *Farsetia.* Silicle sessile, oval or orbicular, with flat valves. Seeds winged Calyx bisaccate at base. Petals entire

1398 *Berteroa* Silicle sessile, elliptical or obovate, with flat or concave valves. Calyx equal at base. Petals 2-parted The small stamens toothed

1399. *Aubrietia* Silicle oblong with convex valves Seeds not edged. Calyx bisaccate at base. Petals entire Smaller stamens toothed.

1400. *Vesicaria* Silicle globose inflated with hemispherical valves Seeds more than 8. Petals entire.

1401. *Alyssum.* Silicle orbicular or elliptical, with valves flat or convex in centre Seeds 2-4 in each cell. Calyx equal at base. Petals entire Some the stamens toothed.
1402 *Clypeola.* Silicle orbicular, 1-celled, 1-seeded, with flat valves Calyx equal. Petals entire Stamens toothed.
1403 *Peltaria.* Silicle orbicular, 1-celled, 1-4-seeded, with flat valves Seeds two in each cell. funicles adhering to the dissepiment.
1404. *Petrocallis* Silicle sessile, oval, with flattish valves. Seeds two in each cell funicles adhering to the dissepiment
1405 *Draba.* Silicle sessile, oval or oblong, with flat or convex valves. Seeds many, not edged. Calyx equal Petals entire All the stamens without teeth.
1406 *Erophila* Silicle oval or oblong, with flat valves. Seeds many, not edged Calyx equal Petals 2-parted Stamens without teeth
1407. *Cochlearia* Silicle sessile, ovate-globose or oblong, with ventricose valves Seeds many, not edged. Petals entire Stamens without teeth

**** Silicle opening, with a very narrow dissepiment, and keeled navicular valves. Seeds oval, sometimes margined. Cotyledons flat, accumbent, contrary to the dissepiment* THLASPIDEÆ, *Dec.*

† *Cells of silicle 2-many-seeded*

1408 *Thlaspi.* Silicle emarginate at end, with navicular valves, winged at back. Cells two, many-seeded
1409 *Capsella* Silicle triangular, cuneate at base, with navicular valves, not winged Cells many-seeded
1410 *Hutchinsia.* Silicle elliptical, with navicular valves, not winged. Cells 2-seeded, rarely many-seeded
1411 *Teesdalia* Silicle oval, emarginate at end, with navicular valves and 2-seeded cells. Stamens having a scale inside at their base

†† *Cells of silicle 1-seeded*

1412 *Iberis* Two outer petals largest. Silicle compressed, truncate, emarginate
1413 *Biscutella* Silicle flat, biscutate, with the cells laterally united to the axis Style long, persistent. Embryo inverted

***** Silicle not opening, with concave indistinct valves, and sometimes with scarcely any trace of a dissepiment. Seeds oval, very few Cotyledons flat, accumbent, parallel with dissepiment* ECLIDIEÆ, *Dec*

1414 *Euclidium* Silicle drupaceous, ovate, with manifest sutures Style subulate Cells 1-seeded
1415 *Ochthodium* Silicle coriaceous, subglobose Stigma sessile Dissepiment thick. Cells 1-seeded.

****** Silicle opening lengthwise, with concave valves, bearing internally transverse horizontal dissepiments separating the seeds Seeds not margined Cotyledons flat, accumbent, parallel with the dissepiment* ANASTATICÆ, *Dec*

1416 *Anastatica* Silicle ventricose, with valves bearing an appendage outside at the end

******* Silique or silicle separating across into 1-2-celled, 1-2-seeded joints Seeds not edged Cotyledons flat, accumbent, parallel with the dissepiment when there is any* CAKILINEÆ, *Dec*

1417 *Cakile* Silicle 2-jointed, compressed the upper joint ensiform. Seeds solitary in the cells. upper erect, lower pendulous.
1418 *Rapistrum* Silicle 2-jointed the upper joint ovate, rugose Seeds solitary in the cells upper erect, lower pendulous
1419 *Chorispora* Silique roundish, with many equal joints Seeds all pendulous

2 *Cotyledons flat, incumbent Radicle dorsal Seeds ovate, not margined* (O‖) NOTORHIZEÆ, *Dec*

** Silicle 2-celled, opening lengthwise, with concave or keeled valves Seeds ovate or oblong, not margined. Cotyledons flat, incumbent, contrary to the dissepiment* SISYMBRIEÆ, *Dec*

1420 *Malcomia* Silique roundish Stigma simple much pointed
1421 *Hesperis* Silique roundish, or about 4-cornered Stigmas 2, erect, conniving. Calyx bisaccate at base
1422. *Sisymbrium* Silique roundish, sessile upon the torus Stigmas 2, somewhat distinct or connate in a head Calyx equal at base
1423 *Alliaria* Silique roundish, 4-cornered, with prominent nerves Calyx lax
1424 *Erysimum* Silique 4-cornered Calyx closed

*** Silicle with concave valves, and with a dissepiment elliptical in its greatest diameter Seeds ovate Cotyledons flat, incumbent, contrary to dissepiment* CAMELINEÆ, *Dec*

1425 *Camelina* Silicle obovate or subglobose, with ventricose valves and many-seeded cells Style filiform
1426 *Neslia* Silicle subglobose, with concave valves, 1-celled, 1-seeded, indehiscent

**** Silicle with a very narrow dissepiment, and with keeled or very convex valves Seeds solitary or few in the cells, ovate, not margined Cotyledons flat, incumbent, parallel with the dissepiment* LEPIDINEÆ, *Dec.*

1427. *Coronopus* Silicle twin Valves ventricose or subcarinate, scarcely dehiscent, 1-seeded.
1428 *Lepidium.* Silicle ovate or subcordate, with carinate or rarely ventricose valves, opening with 1-seeded cells
1429 *Æthionema* Silicle oval, generally emarginate, with navicular valves, and 1-2-seeded cells. Larger stamens either united or toothed

***** Silicle with indistinct or indehiscent keeled valves, 1-celled, 1-seeded, with an obliterated dissepiment. Seeds ovate, oblong Cotyledons flat, incumbent, apparently in the same direction as the dissepiment should be.* ISATIDEÆ, *Dec*

1430 *Isatis* Silicle elliptical, flat, 1-celled, 1-seeded, with carinate navicular valves, which are scarcely dehiscent
1431. *Myagrum* Silicle compressed, almost cuneate, with two empty hollows at end, and at base 1-celled, 1-seeded.

3 *Cotyledons incumbent, folded together, or plaited lengthwise through their middle, and enwrapping the radicula Style generally enlarged, with a cell and seed at its base Seeds generally globose, never margined* (O>>) ORTHOPLOCEÆ, *Dec*

** Silique with valves opening lengthwise, and a linear dissepiment Cotyledons folded together* BRASSICEÆ, *Dec*

1432. *Brassica* Silique roundish. Style small, short, obtuse Seeds in one row Calyx closed
1433 *Sinapis.* Silique roundish, with nerved valves Style small, short, acute Seeds in one row Calyx spreading
1434 *Moricandia.* Silique 4-cornered, sowewhat 2-edged Seeds in two rows. Calyx bisaccate at base
1435. *Diplotaxis* Silique compressed, linear. Seeds in two rows Calyx equal at base
1436 *Eruca* Silique roundish Style large, ensiform or conical Seeds in one row Calyx equal at base.

** *Silicle with concave valves, opening lengthwise, with an elliptical dissepiment Cotyledons folded together.* Vellæ, *Dec*

1437. *Vella.* Larger stamens connate. Style ovate, flat, at the end of a tongue-shaped silicle.
1438 *Carrichtera* Stamens all free Style ovate, flat, foliaceous
1439 *Succowia* Stamens all free Style slender, conical. Valves of the silicle echinate.

*** *Silicle indehiscent, ovate or globose, 1-celled, 1-seeded, with indistinct valves Seeds globose Cotyledons folded together* Zillæ, *Dec*

1440 *Zilla* Silicle 2-celled Cells 1-seeded
1441 *Calepina.* Silicle 1-celled, 1-seed. Seed pendulous. Outer petals rather the largest.

**** *Silicle or silique dividing across into one or few-seeded joints or cells. Seeds globose. Cotyledons folded together.* Raphaneæ, *Dec*

1442 *Crambe* Silicle with two joints, of which the lower is abortive, the upper globose 1-seeded.

History, Use, Propagation, Culture,

1380. *Schizopetalon* A curious genus of Chilian plants, with pinnatifid petals, whence the name has been formed, from σχίζω, to divide A plant of difficult cultivation It is raised from seeds, which it produces sparingly, and only in a well-aired cool greenhouse

1381 *Mathiola.* Named after Peter Andrew Matthioli, an Italian physician, born in 1500, died in 1577. He was first physician to Ferdinand of Austria, and author of a laborious commentary upon Dioscorides Herbs, or rarely shrubs, nearly all covered with a white stellate soft down M incana, annua, græca, and fenestralis are popular border flowers, especially the first, the leaves of all the species, and also of Cheiranthus, and many other plants of this class, may be used as potherbs or salads

1382. *Cheiranthus.* So called from the Arabic *kheyry*, the name of a plant with red sweet-scented flowers Herbs, or occasionally shrubs, with entire or toothed leaves, and flowers of various colors. C Cheiri is a

1443 *Raphanus.* Silique transversely many-celled or dividing into several joints.

4. Cotyledons incumbent, linear, spirally or rather circinately twisted. (O|||) SPIROLOBEÆ, *Dec.*

1444 *Bunias* Silicle nucamentaceous, indehiscent, 2-4-celled Cotyledons twisted spirally
1445 *Erucaria.* Silique lomentaceous, 2-jointed, the lower joint having two cells, the upper being ensiform. Cotyledons replicate, somewhat spiral.

5. Cotyledons incumbent, linear, with two legs, or a double plait, that is to say, plaited twice crosswise. Seeds depressed (O,||||) DIPLECOLOBEÆ, *Dec.*

1446 *Helsophila* Silique elongate or rarely oblong or oval. Dissepiment linear or oval. Valves flat, or in the long siliques somewhat convex Calyx equal at base
1447 *Subularia* Silicle oval. Dissepiment elliptical Valves convex Cells many-seeded Stigma sessile

C *Cotyledons 2. Petals 4, not cruciate Thalamus large, hemispherical or elongated Stamens 4-6-00*

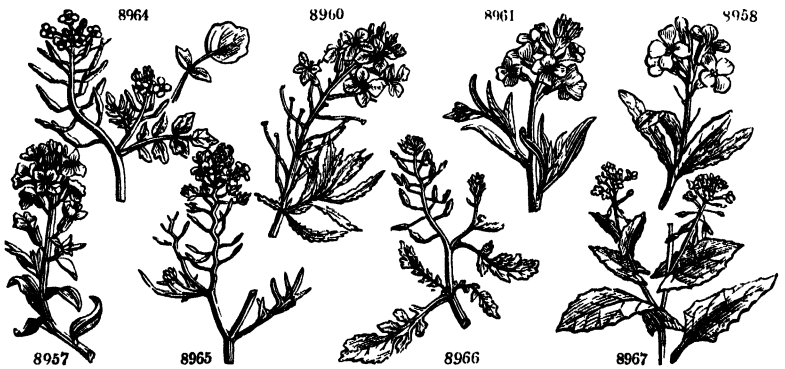
1448 *Cleome* A honey gland at each division of the calyx, except the lowest. Calyx 4-leaved. Petals ascending.

8945 Stem weak cæsious, Petals pinnatifid quickly perishable

8946 Stem shrubby at base erect branched, Leaves lanceolate entire hoary, Pods subcylind. without glands

8947 Stem herbaceous erect branched, Leaves lanceolate blunt hoary, Pods subcylindrical without glands
8948 Stem half shrubby erect branched, Leaves lanceolate smooth, Pods somewh it compressed without glands
8949 Stem herbaceous erect branched, Leaves lanceol ite smooth, Pods somewhat compressed without glands
8950 Stem ½ shrubby erect simple, Leaves close obovate downy, Pods downy without glands broadest at base
8951 Stem somewhat erect herbaceous branch Lvs obl downy, lower sinuated, Pods comp velvety and gland.
8952 Stem erect branched, Leaves downy or pubescent toothed or pinnatifid, Pods compressed downy
β Pods twice as short as α
8953 Stem erect nearly simple naked, Leaves linear blunt hoary entire, Flowers subsessile, Pods compressed
8954 Stem ½ shrubby at base branched erect, Leaves downy linear entire or toothed, Fl subsess Pods roundish
8955 Stem suberect branched, Leaves sinuate pinnatifid, Pods with three acute nearly equal points
8956 Stem suberect branched, Leaves downy lanceolate repand toothed, Fl sessile, Middle point of pod longest

8957 Leaves lanc entire, Hairs 2-parted appressed or none, Pods linear, Stigmas with recurved lobes



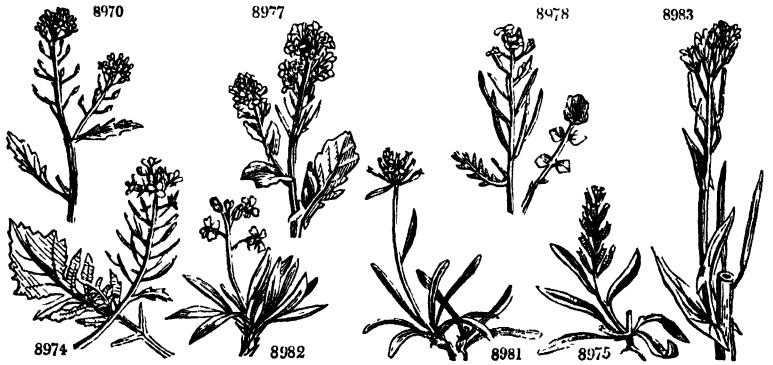
8958 Lvs obl lanc somew toothed, Hairs 2-parted or none, Stem decum branch. Pet obov Pods erect pointed
8959 Leaves linear entire somewhat silky, Stem half shrubby
8960 Leaves linear-lanceolate acuminate finely serrated downy with 2-parted hairs, Stem shrubby branched

8961 Leaves linear-lanceolate acuminate entire downy with appressed 2-parted hairs, Stem shrubby branched

8962 Leaves lin lanc entire roughish, Stem shrubby branched, Pods compressed, Pedic half as short as calyx

8963 Leaves linear entire rough clustered, Stem shrubby branched, Pods roundish 3 times as long as calyx

8964 Leaves pinnatifid, Segments ovate subcordate repand
8965 Leaves pinnatifid, Segments lanceolate serrate or cut
8966 Leaves pinnated-lobed, lobes confluent toothed smooth, Root fusiform, Petals as long as calyx
8967 Downy, Rad lvs toothed backwards, cauline sagittate oblong blunt, Stems erect branched from the base
8968 Radical leaves stalked obovate toothed or lyrate upper pinnatifid, Lobes linear entire



and Miscellaneous Particulars

popular flower of long standing, admired for its various colors and agreeable odor Being an acrid and hardy evergreen, it is sometimes sown in pastures, along with parsley, thyme, &c. as a preventative of the rot in sheep

1383. *Nasturtium*, is said to have been so called from the effect its acrimony produces upon the muscles of the nose, *nasus tortus* signifying a convulsed nose *Pliny* N. officinale is a well known popular salad, gathered wild in most parts where it is found, and since 1808, cultivated to a considerable extent in the neighbourhood of London A running stream of clear water is essential to its cultivation, in the bed of this stream the plants are inserted in rows in the direction of the current, and all that is necessary is to take up and replant occasionally, and to keep up the plants free of mud or any accumulation of extraneous matters, and to see that other plants, especially the Sium nodiflorum, a poisonous plant resembling the watercress, do

History, Use, Propagation, Culture,

not find their way into the plantation Near Rickmansworth, in Hertfordshire, there is a fine stream of water on a chalky bottom, in which one cultivator grows five acres, and sends a supply to London every day in the year, Sundays excepted There are also large plantations at Uxbridge, Gravesend, and other places.

Some market-gardeners, who can command a small stream of water, grow the water-cress in beds sunk about a foot in a retentive soil, with a very gentle slope from one end to the other Along the bottom of this bed, which may be of any convenient length and breadth, chalk or gravel is deposited, and the plants are inserted about six inches distance every way Then, according to the slope and length of the bed, dams are made six inches high across it, at intervals, so that when these dams are full, the water may rise not less than three inches on all the plants included in each The water, being turned on, will circulate from dam to dam; and the plants, if not allowed to run to flower, will afford abundance of young tops in all but the winter months A stream of water no larger than what will fill a pipe of an inch bore, will, if not absorbed by the soil, suffice to irrigate in this way an eighth of an acre As some of the plants are apt to rot off in winter, the plantation should be laid dry two or three times a year, and all weeds and decayed parts removed, and vacancies filled up Cress grown in this way, however, is far inferior to that grown in a living stream flowing over gravel or chalk

The water-cress has lately been cultivated in the neighbourhood of Paris, and also near Edinburgh.

1384 *Leptocarpæa* From λεπτος, slender, and καρπος, fruit A genus distinguished from Sisymbrium by its accumbent cotyledons

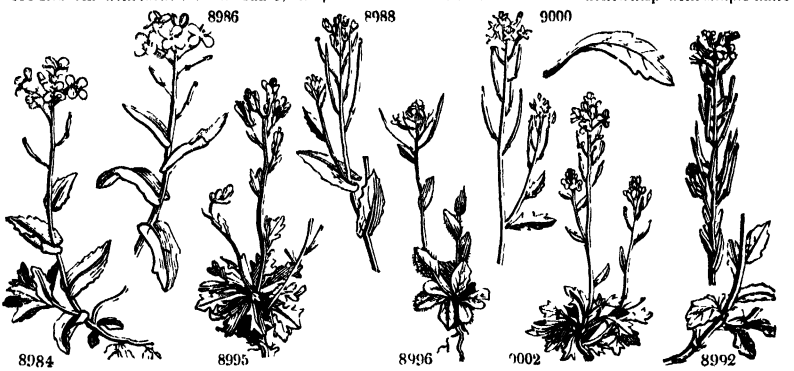
8969 Radical leaves stalked obovate or lyrate, Cauline amplexicaul pinnatifid, Lobes linear entire
8970 Leaves obl lanc pinnatifid or serrated, Root fibrous, Petals larger than calyx, Silicules ellipsoid
8971 Leaves obovate cuneate toothed at end, Pods roundish subturgid, Bractes a little shorter than pods
8972 Lvs smooth rad stalked pinnatif, caul stem-clasping cut serr Pods roundish, Pedic bracteate very short
8973 Lvs ovate lanc. toothed backwards acuminate at each end smooth, Pods roundish 4 times as long as stalk

8974 The only species Leaves stalked pinnatifid sublyrate with cut toothed acuminate lobes

8975 Pods 2-horned, Petals equal, Leaves entire, Hairs strigose fixed by their middle 2-parted appr scattered
8976 Pods 2-horned, Petals unequal, Leaves ent. Hairs strigose fixed by their middle 2-parted very numerous

8977 Lower leaves lyrate terminal lobe roundish, upper obovate toothed
8978 Lower leaves lyrate · terminal lobe ovate, upper pinnatifid with linear oblong entire lobes
8979 Radical and lower leaves pinnatifid-lyrate lateral lobes ovate, terminal cordate entire
8980 Lower leaves toothed lyrate lateral lobes dentiform, terminal very large subcordate, upper ovate

8981 Leaves linear narrowed at base smooth acute



8982 Pods lin.-oblong, Anthers oval, Leaves entire, Peduncles smooth

8983 Rad. leaves toothed hairy cauline stem-clasping entire smooth, Pods erect 6 times as long as stalk

8984 Cauline lvs cord. stem-clasping rough with 3-parted down, Pedicels shorter than cal Stigma somew emarg
8985 Leaves many-toothed villous with branched hair lanc acute rad somew stalked, caul cord stem-clasp
8986 Leaves few-toothed hoary with branched hairs rad obov oblong, cauline cordate sagitt stem-clasping

8987 Lvs pubesc with minute stellate down rad obl stalked sinuate toothed, cauline sagittate lanceol entire
8988 Lvs somew toothed rough with branch hair lower oval narr into a stalk, cauline bluntly cord.-auricled
8989 Lvs somew toothed rough with branch hair lower oval narr into a stalk, cauline acutely cord.-auricled
8990 Lvs. acutely toothed lanc stem-clasping wavy rough with branching hairs rad narrowed into the stalk
8991 Lvs somew toothed rough rad ovate or obl narrowed into the stalk, cauline lanceol sagittate cordate
8992 Lvs toothed rough with generally branched hairs radical obov obl narr into the stalk, caul ovate lanc
8993 Lvs smooth radical ovate-oblong somewhat toothed narrowed at base, cauline sessile ovate serrated

8994 Leaves hairy with branched pubescence radical spatulate bluntly toothed, cauline ovate acutely toothed
8995 Leaves rough with scattered bifid down radical obov toothed, cauline obl nearly entire, Raceme erect
8996 Leaves somewhat toothed smooth ciliated radical subsessile oval oblong, cauline oblong, Raceme erect
8997 All the lvs sessile somew toothed hoary with branched hairs radical obov obl, cauline obl Rac erect
8998 Leaves hairy somewhat toothed radical stalked ovate oblong, Stem branched, Pods ascending
8999 Leaves nearly entire rough with branched hairs radical and caul oval narrowed at base, Raceme lax
9000 Lvs pubesc coarsely toothed rad spatulate lanc narrowed into the stalk, caul lanc Pods pubescent
9001 Leaves oblong acute sessile entire smooth, Stems strigose, Runners creeping, Pods spreading
9002 Leaves nearly smooth radical cut, cauline oblong linear entire, Stem generally branched
9003 Rad leaves lyrate pinnatifid smooth or ciliated cauline linear, Stem hispid at base somewhat branched
9004 Lvs vill with forked down rad lyrate pinnat caul cut toothed Stem branched hisp with simple hairs

and Miscellaneous Particulars

1385 *Notoceras* From νωτος, the back, and κερας, a horn The structure of the pod of this genus is intermediate between Erysimum and Capsella The species are small annuals, with very minute flowers, which are sometimes apetalous

1386 *Barbarea* A name used by Dodoens, because the plant had been called the herb of St. Barbara by some preceding botanists B vulgaris is sometimes cultivated as a spring salad, but is much less delicate than the common cress, and has nothing in flavor to recommend it B præcox, the American or Bellevue cress of gardeners, is preferred to the other, and cultivated in a number of gardens

1387 *Braya* A curious little plant, with the habit of Arabis cærulea Leaves are linear, racemes terminal, flowers purple The genus is not completely known, but it appears to be intermediate between Siliquosæ and Siliculosæ, related to Draba on one hand, and Arabis on the other It is a native of the Carinthian alps, where it was found by Dr Hoppe, who named it after Count Bray, a German nobleman

1388 *Parrya* Named by Mr R Brown, after Captain Edward Parry, the commander of the British expeditions to discover the north-west passage round America It was found upon Melville island, and once was raised from seeds brought home by some of the officers, but it never flowered, and is now lost

1389 *Turritis.* From *turris*, a tower, the leaves and seeds giving the stem a pyramidal form This genus is principally distinguished from Arabis by its seeds being in two rows, and by its habit

1390 *Arabis* Native of *Arabia*, according to De Theis, but this is a forced explanation, and scarcely the true root of the word. Distinguished from all the neighbouring genera by its linear compressed siliques, and flat valves.

History, Use, Propagation, Culture,

1391 *Macropodium* So named because the pod is elevated above the receptacle upon a stalk, μακρος, long, and πους, a foot or stalk A genus differing from Arabis chiefly in its stalked pod, and its calyx being a little thickened at the base A little, smooth, erect, simple herb, with ovate, lanceolate, acuminate leaves, and white flowers

1392 *Cardamine* From καρδια, the heart, and δαμαω, to strengthen, in allusion to its supposed stomachic qualities The leaves of C pratensis were formerly used in salads C impatiens is so named from the sudden bursting of the seed pods, being ripe and pressed between the fingers C. pratensis frequently has double flowers. C hirsuta and, it is said, other species, produce young plants from the leaves All that is necessary is to lay the leaf on a moist grassy surface, or on moss kept moist. The plant propagates itself extensively in this way in moist soils

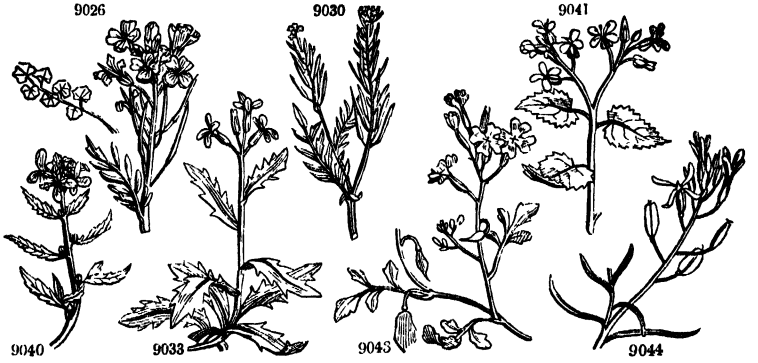
1393. *Pteroneuron* From πτερον, a wing, and νευρον, a nerve, in allusion to the winged nerves of the pods, by which it is distinguished from Dentaria and Cardamine

9005 Lower lvs stalked lyrate · terminal lobe ovate, upper lanceolate cut, Stem branched weak softly villous
9006 Leaves all stalked ovate acumin coarsely toothed velvety with very fine down, Pedic and pods spreading
9007 Lvs. stem-clasping acum somewhat toothed pubescent, Pedicels length of calyx, Pods 1-sided decurved
9008 Leaves stem-clasping toothed oblong dilated and cordate at base, Stem furrowed hispid, Pods pendulous
9009 Cauline leaves linear sessile smooth lower somewhat toothed, radical obovate, Pods erect
9010 Cauline leaves sessile oblong lanceolate acuminate somewhat toothed, Pods pendulous falcate [stalk
9011 Lvs roughish nearly ent rad obov, caul ov. or obl Rac nodding, Pods erect 3 times as long as their
9012 Lvs smooth nearly entire rad obovate, cauline ovate, Raceme erect, Pods 4 times as long as their stalk
9013 Leaves smooth nearly entire rad oblong obovate, cauline few oblong, Raceme nodding, Pods erect
9014 Lvs hoary with stellated down obl sinuate toothed rad. stalked, caul sess. Pods 8 times as long as their
9015 Leaves stem-clasping shining [stalk

9016 Leaves ovate lanceolate acuminate subserrate, Raceme terminal long

9017 Lvs smooth stalked cordate roundish subsinuate toothed, Stem erect, Pods erect twice as long as stalk
9018 Leaves smooth thickish radical stalked ovate entire, cauline few entire or 3-lobed, Pods erect
9019 Leaves smooth membranous stalked radical undivided, lower cauline 3-fid, upper 5-lobed, Pods erect
9020 Leaves smooth 3-fid, Segments stalked ovate acuminate toothed, Pods spreading
9021 Lvs smoothish 3-fid, Segm sess rhomb roundish tooth Scape naked, Lower branches root-like creeping
9022 Leaves above downy trifid, Segments somewhat stalked ovate lanceolate crenate, Stem ascending
9023 Radical leaves stalked ovate subcordate cauline pinnatifid with oblong entire lobes, Root granular
9024 Leaves pinnatifid, Segments of radical roundish, of cauline toothed angular, Stem rooting at base
9025 Lvs pinnatifid, Segm ovate nearly entire term round 3-lobed, Runners creeping, Stem ascend pubesc
9026 Lvs pinnatifid, Segm of rad. roundish of cauline linear or lanc entire, Style very short, Stigma capitate

9027 Leaves pinnatifid or lyrate, Lobes oval angular toothed blunt, Stem erect, Petals oblong linear
9028 Leaves pinnatifid, Segm of radical roundish mucronate stalked, of the upper oblong subsess Petals obl
9029 Leaves pinnatifid, Lobes sessile obl linear entire the lowest distant from the stem, Petals oblong linear
9030 Leaves pinnatifid, Segm oval oblong somewhat toothed, lowest close to the stem acute stipule-like
9031 Leaves pinnatifid smooth, Segm 3-7 roundish toothed angular, Pods erect a little longer than stalk,
9033 Leaves pinnatifid nearly smooth, Segm stalked ovate toothed lower pinnatifid, Segm. 3-4



9033 Segm. of leaves somewhat stalked roundish tooth-lobed nearly equal

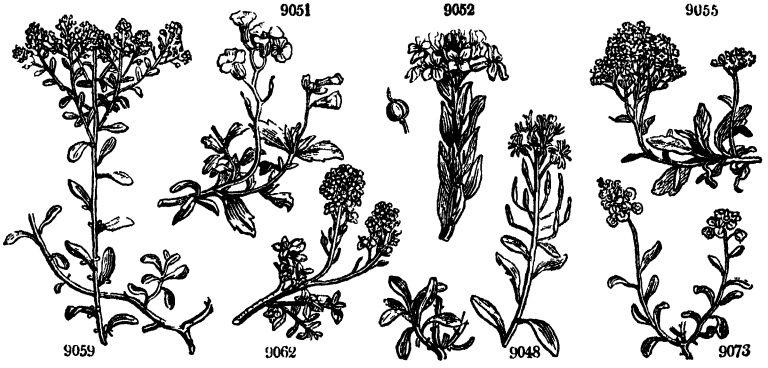
9034 Leaves 3 whorled stalked trifid, Segm. oval lanceolate acuminate serrated, Stamens length of petals
9035 Leaves 1-2 alternately shortly stalked 3-fid, Segm ovate lanceolate coarsely and unequally serrate lobed
9036 Leaves many alternate stalked trifid, Segm broad oval cut toothed, Axillæ without glands
9037 Leaves many alternate stalked trifid, Segm ovate-lanceolate remotely toothed, Axillæ with glands
9038 Caul lvs many alternate stalked palmate 5-lobed, Segm oblong lanceolate acuminate coarsely serrated
9039 Cauline leaves alternate stalked pinnatifid, Segm oblong acuminate serrate toothed
9040 Cauline leaves alternate pinnatifid upper undivided mostly bearing bulbs in the axillæ

9041 Pods lanceolate narrowed at each end
9042 Pods elliptical blunt at each end

9043 Leaves sub bipinnatifid, Lobes oblong sinuate angular

9044 Stem shrubby erect, Leaves linear with close hairs
9045 Stem half-shrubby at base erect, Leaves lanceolate downy
9046 Stems half-shrubby ascending, Leaves oblong obovate stalked and pods hoary with down
9047 Stems herbaceous erect, Leaves oblong rep und, Pods velvety with short down, Stigma capitate

and Miscellaneous Particulars



1394 *Dentaria* From *dens*, a tooth, its roots are furnished with projecting angles, which resemble the molar teeth of quadrupeds Plants with broad palmate or pinnate leaves, and shewy white, yellowish, or purple flowers The dried root of D diphylla is used instead of mustard by the Americans, under the name of *pepper root*

1395 *Lunaria.* Derived from *luna*, the moon, in allusion to the broad round silvery silicles Large hairy plants, with alternate or opposite cordate leaves, and large lilac flowers

1396 *Ricotia.* A word, the meaning of which is no where explained It was probably formed after some obscure botanist Small weak branched annual plants, with variously lobed foliage, and pale lilac flowers

1397 *Farsetia* In memory of Philip Farseti, a noble Venetian, celebrated for his botanical erudition. A small genus, with hoary entire leaves, and yellow or dirty-white flowers

History, Use, Propagation, Culture,

1398 *Berteroa.* Named after Charles Joseph Bertero, a pupil of Balbis, and a friend of M Decandolle, who speaks in high terms of his merits A genus distinguished from its allies by its bifid petals and peculiar habit.

1399 *Aubrietia* Named by Adanson, after Aubriet, the famous French botanical draughtsman. A genus very distinct in habit, and sufficiently different from Berteroa in its entire petals, and from Alyssum in its bisaccate calyx and oblong fruit

1400 *Vesicaria* From *vesica*, a blister or bladder The silicles of this genus are inflated like small bladders This is a genus which combines species with bisaccate and an equal calyx, with entire and toothed stamens, with edged or not edged seeds, and with a deciduous or persistent calyx. It will, therefore, require division hereafter

1401 *Alyssum.* From α, privative, and λυσσα, rage, the Alyssum passed among the ancients for a plant which possessed the properties of allaying anger The αλυσσον of Dioscorides is referred by Sprengel to A. alpestre. The species are shewy plants, of easy culture A saxatile is very ornamental early in the season.

9048 Silicles pubescent somewhat ventricose

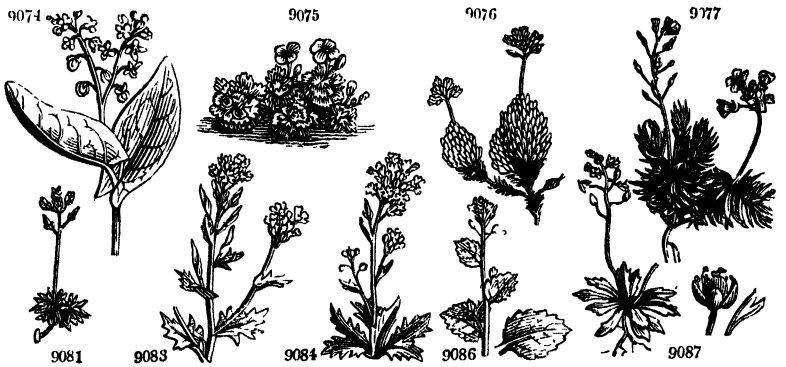
9049 Silicles compressed flat elliptical smooth

9050 Silicles flat elliptical downy

9051 Pedicels longer than calyx

9052 Calyx bisaccate, Leaves oblong entire smooth, lower ciliate subspatulate
9053 Calyx equal somewhat spreading and leaves velvety oblong entire or sinuate toothed, Stem herbaceous
9054 Calyx deciduous, Leaves oblong entire or repand wavy hoary with down

9055 Stems ½ shrubby at base subcorymbose, Leaves lanc entire downy, Pods obov orb 2-seeded, Seeds edged
9056 Stems ½ shrubby at base panic Leaves lanc nearly entire velvety, Pods roundish 2-4-seeded, Seeds edged
9057 Stems ½ shrubby at base hoary with stellate down, Lvs obl spatul silvery beneath, Pods ovate roundish
9058 Stems ½ shrubby at base hoary with stellate down, Leaves obl obov silvery beneath, Pods elliptical
9059 Stems ½ shrubby at base hoary with stellate down, Leaves obl nearly acute whitish beneath, Pods ovate
9060 Stems ½ shrubby at base twisted diffuse hoary, Leaves hoary sublanceolate, Racemes corymbose
9061 Stems ½ shrubby at base diffuse hoary, Leaves obovate hoary, Racemes simple, Pods ovate oblong
9062 Stems diffuse pubescent, Leaves hoary lower obovate, upper oblong, Racemes simple
9063 Stem erect, Flowering branches panic Lvs lanceol downy, Pods roundish elliptic little longer than style
9064 Stem erect, Leaves lanceolate, Pods hirsute in long racemes twice as long as style
9065 Stems diffuse, Leaves lanceolate or somewhat linear hairy, Pods roundish rough 6 times as long as style
9066 Stems diffuse, Leaves linear lanceolate hoary, Cal persistent, Pods four times as long as style
9067 Stems diffuse, Leaves linear lanceolate hoary, Pods roundish emarginate smooth
9068 Stem erect, Leaves velvety oblong sinuated upper linear, Cal spreading, Petals bifid
9069 Stems half shrubby at base procumbent, Leaves lin lanceol acute somewhat hoary, Pods oval smooth
9070 Stems half shrubby at base somewhat erect, Rad lvs obl-lanc acute silvery caul few lin Pods woolly
9071 Stems ½ shrubby ascend Lvs obl obt narrowed at base scaly, Pods roundish smooth twice as long as style
9072 Stem shrubby, Branches and old peduncles spiny, Leaves obl linear silvery, Pods round smooth



9073 Stems diffuse or ascending

9074 Cauline leaves sagittate stem-clasping, Pods flat smooth

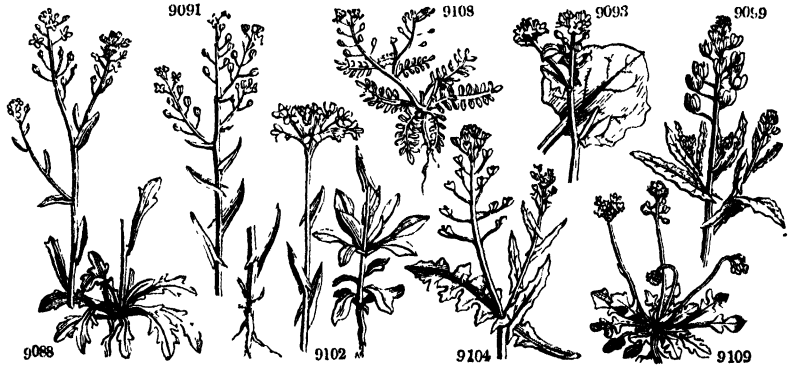
9075 Leaves sessile 3-5-fid at end cuneate at base

9076 Scapes naked smooth, Leaves rigid linear lanceolate keeled ciliated, Stamens as long as petals
9077 Scapes naked smooth, Leaves long linear keeled ciliated, Stamens scarcely as long as calyx
9078 Scapes naked smooth, Leaves linear keeled rigid ciliated, Style as broad as hairy pod but twice as short
9079 Scapes naked downy, Leaves lanceolate flat hairy, Hairs branched, Pods oblong, Style very short
9080 Scapess downy with 2 toothletted leaves, Rad leaves obl nearly entire downy, Pods smooth
9081 Scapes naked or 1-leaved downy, Leaves lanc hairy nearly entire, Pods lanceol pubescent
9082 Scapes 1-leaved pubescent, Leaves ovate obl with a short starry down, Pedicels downy, Pods oblong
9083 Stem leafy branched velvety with starry down, Leaves ovate toothed, Pod obl smooth somewhat twisted
9084 Stem leafy branched velvety with starry down, Leaves obl somewhat toothed, Pods obl pubescent
9085 Stem branched leafy downy, Leaves ovate toothed downy, Pods ellipt obl many-seeded (32-36) velvety
9086 Stem branched leafy downy, Lvs ovate toothed subcord. stem-clasping somewhat hairy, Pods smooth few-[seeded (12-16)

9087 Pods elliptical shorter than stalk, Scapes 5-15-flowered

and Miscellaneous Particulars

1402 *Clypeola* From *clypeus*, a buckler, in allusion to the form of its silicle. A little annual plant, hoary, with stellate pubescence.



1403 *Peltaria.* A name with the same meaning and application as the last; πελτη signifies in Greek a small buckler

1404. *Petrocallis* From πετρος, a rock, and καλος, beautiful, in allusion to the rocky places where it grows, and which it enlivens with its elegant tufts of rose-colored flowers

1405 *Draba* From δραβη, acrid, biting, according to Linnæus Little annual or perennial plants, found, for the most part, in the cold mountainous countries of Europe, a few are also found in America Some of the species have siliques, others silicles

1406 *Erophila* A genus divided from Draba, on account of its bifid petals, and deriving its name from ηρ, the spring, and φιλεω, to love, in allusion to the time of the year when it appears

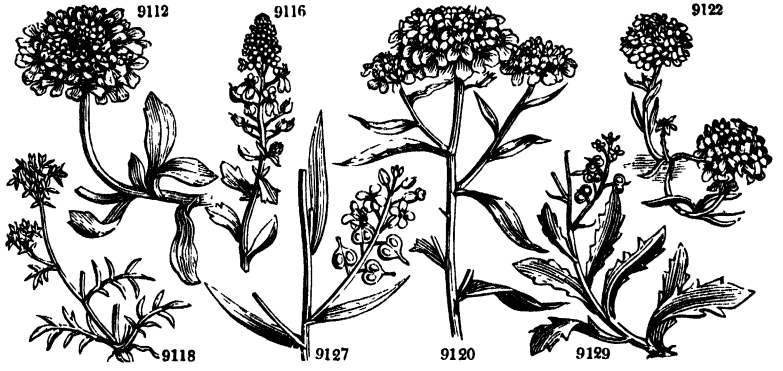
History, Use, Propagation, &uture,

1407. *Cochlearia* From *cochlear*, a spoon The leaves are hollowed and concave like the bowl of a spoon. The annual species were formerly used as spring salads and antiscorbutics, but are now generally neglected.

C armoracia, the horse radish, is cultivated as a condiment to roast beef It is called upon the continent *Cran, Cran de Bretagne, Rafort, Rerredych*, &c &c Two excellent modes of cultivating it have lately been described in the Horticultural Transactions, by Knight, a nurseryman, and Judd, a gardener. Both agree in trenching the soil to a considerable depth, and putting the manure at the bottom of the trench, but Knight plants the sets on the surface, and calculates on the root that strikes down to the dung for produce Judd, on the other hand, makes holes quite to the bottom of his trenched soil, and in each drops a set, filling up the hole with wood ashes, rotten tan, or sand, calculating for produce on the shoot made from the set at the bottom of the hole, up through the sand or ashes to the surface Judd's mode is the most ingenious, and appears the best, but either will do extremely well A moist soil increases the bitter and alkaline flavor of this and all the Cruciferæ

Common scurvy-grass has powerful medical properties, as antiscorbutic and sialagogue, and stimulating the digestive organs For ample details respecting its qualities, consult *Wier Cochl Descr* lib 1, Basileæ. 1567. *Mœllenoroch Cochl Cur*, Lipsiæ. 1674 *Murr App Med* 2 p 420, &c



9088 Pods lentiform smooth, Rad leaves obl toothed hairy, cauline linear oblong
9089 Pods ellipsoid, Rad leaves obl crenate, cauline long lanceolate toothed or cut, Root large fleshy
9090 Pods ellipsoid, Rad. lvs obl crenate, cauline lanc toothed, Teeth cartilaginous, Root fleshy, Sepals erect
9091 Pods roundish, Cauline leaves cordate sagittate stem-clasping acuminate entire
9092 Pods ovate roundish with netted veins twice as short as stalk, Rad leaves stalked ovate entire, caul. obl.
9093 Pods ovate globose twice as short as stalk, Rad leaves stalked cordate, cauline ovate toothed angular
9094 Pods ovate the length of stalk, Rad leaves stalked reniform entire, cauline scarcely any
9095 Silicles ellipsoid the length of pedicel, Leaves all stalked subdeltoid
9096 Silicles roundish emarginate, Pedicels and petioles radical long, Leaves ovate rounded entire

9097 Radical leaves on long stalks cordate repand-toothed, cauline ovate cordate on short stalks
9098 Rad. lvs somewhat stalked obovate-obl, cauline oblong at the base hastate stem-clasp. with acute auricles
9099 Leaves oblong toothed, Stems erect, Silicles obovate orbicular shorter than pedicel
9100 Lvs. obl tooth blunt, lower stalked, upper sagit stem-clasp with acute auricles, Silicles subov ventricose
9101 Lvs. somew tooth rad stalk, caul cord stem-clasp Stem branch Pet length of cal Silicles obcordate
9102 Lvs somew fleshy ent. rad obov stalk, caul obl sagitt stem-clasp Pet larg than cal Silic obc 4-seeded
9103 Lvs. nearly entire rad. ovate stalked, caul obl stem-clasp Pet. as long as cal. Silic. obcord. 8-12-seeded

9104 Radical leaves pinnatifid, Silicles obcordate
[twice as short as silicle
9105 Lvs somew fleshy entire lower stalk obov, caul ovate obl somewhat stem-clasp Stam petals and style
9106 Lvs somew fleshy lower stalk obov obl entire, caul obl Stamens petals and style about length of silicle
9107 Lvs pinnated smooth, Pet twice as long as decid cal Silicles acute at each end, Style very short exserted
9108 Lvs. pinnated, smooth, Pet scarcely longer than calyx, Silicles blunt at each end 4-seeded, Stigmas sessile

9109 Petals unequal outer largest
9110 Petals equal

9111 Shrubby, Lvs cuneate or spatul blunt ent smooth, Flowers corymbose, Silicles truncate subemarg at end
9112 Shrubby, Leaves cuneiform obtuse somewhat toothed at end a little ciliated, Flowers corymbose
9113 Shrubby, Leaves linear entire somewhat fleshy rather acute smooth or ciliated, Flowers corymbose
9114 Shrubby, Leaves ciliated blunt linear spatulate, lower somewhat toothed at end, Flowers corymbose
9115 Shrubby, Lvs obl blunt narrowed at base smooth, Fls in long racemes, Silic emarg with a narrow recess
9116 Herbaceous, Lvs lanc acute somew toothed, Fls corym becoming racem Silic obcord narrowly emarg.
9117 Herbaceous, Lvs lanc blunt smooth entire or the rad somew toothed, Fls finally racem Silic ovate trun
9118 Herbaceous smooth, Leaves pinnatifid, Racemes corymbose but little elongated after flowering [style
9119 Herb smooth, Lv lin tooth ciliat at base dilat at end, Silic round Lobes of end acute spread short than
9120 Herbaceous smooth, Leaves lanc acuminate lower serrate, upper entire, Silicles umb acutely 2-lobed
9121 Herbaceous smooth, Leaves linear entire radical somewhat toothed, Silicles corymbose 2-toothed
9122 Herb smoothish, Lvs lin entire ciliated at base, Silic corymb emargin with blunt lobes as long as styles
9123 Herb smoothish, Leaves ciliat somew fleshy lower spatul 2-tooth at end, upp lin Silic corymb emarg
9124 Herb smoothish, Lvs stalked spat blunt toothed and ent ciliat Corymb somew umbel Cal hairy at back
9125 Herbaceous smooth, Lvs round spatul ent rather fleshy, Silic corymb emarg with a broad blunt recess
9126 Half-shrubby at base pub Lvs rather fleshy cren lower ob narr at base, upper obl lin Sil somew corymb
[emarginate
9127 Cal bluntly 2-spurred, Silicles smooth rough with elevated dots in centre, Lobes of end meeting over style
9128 Cal bluntly 2 spurred, Silicles smooth even, Lobes at the end somewhat meeting over the style
9129 Cal acutely 2-spur Silic smooth with elevat rough points on disk, not overhang style at end, Stem hispid
9130 Silicles hispid on each disk, Radical leaves lyrate
9131 Silicles smooth even, Radical leaves lyrate

and Miscellaneous Particulars.

1408 *Thlaspi* From θλάω, to compress The Thlaspi, says Pliny, bears seeds like the lentil, and compressed, whence its name. T arvense, when rubbed, has the smell of garlic

1409 *Capsella* A diminutive of *capsula* This, which is the common shepherd's-purse, has been separated from Thlaspi on account of its valves not being winged at back

1410 *Hutchinsia* Named after Miss Hutchins, to whom Sir James Smith was indebted for many communications of submarine algæ during the progress of his English Botany.

1411 *Teesdalia* Named after Mr Robert Teesdale, author of a Catalogue of the Plants growing about Castle Howard, in the North Riding of Yorkshire, published in the Transactions of the Linnean Society Small annual smooth herbs, with revolute leaves, and simple scapes of small white flowers

1412. *Iberis* From the country called *Iberia*, now Spain. Most of the species grow in such countries. They are generally pretty plants, and some of them are commonly cultivated in gardens as hardy annuals, under the name of Candy-tuft, a name which was originally applied to the I umbellata only, which was first discovered in Candia, and called Thlaspi Candiæ by Lobel and Dodonæus

1413 *Biscutella* From *bis scutella*, a double shield, in allusion to the form of its seed-vessel when bursting Small annual or perennial hispid plants, with small bright yellow flowers The species are nearly related to each other, and difficult to distinguish.

History, Use, Propagation, Culture,

1414 *Euclidium.* From ω, well, and κλειδω, to shut up, because of the firmly closed seed vessel.

1415. *Ochthodium* So called from οχθωδης, warted, in allusion to the surface of the pods

1416. *Anastatica* Derived from αναστασις, resurrection This plant has been so called because it has the curious property of recovering its original form, however dry it may be, upon immersion in water The common people believe that if you put this in water at the time when a woman first experences the pains of childbirth, it will expand at the precise moment when the infant is brought into the world. Commonly called Rose of Jericho It grows in the arid wastes of Arabia and Palestine, where it is called *kaf maryam*, that is to say, Mary's hand

1417. *Cakile* An Arabic word employed by Serapio Smooth fleshy annual plants, with pinnatifid leaves, and white or purple flowers They all grow upon the sandy coasts of the northern hemisphere C maritima is said by Angullara to be a powerful cathartic

9132 Silicles even ciliated at edge, Radical leaves lyrate
9133 Silicles even ciliated at edge, Stem erect elongated leafy, Leaves sessile oblong remotely toothed [at base
9134 Sil rough on edge and disk with a very fine down, Rad. lvs obov cun acute tooth Stem somew nak hisp
9135 Silicles rough on the edge and disk with a very fine down, Leaves lanc serrate, Stem leafy branched hairy
9136 Silicles smooth even, Rad leaves rough with hair oblong narrowed into stalk . cauline linear few entire

9137 Silicles smooth even, Leaves rough with hairs, generally radical pinnatifid with 2-3 rem lobes on each side
9138 Sil. smth even, Lvs rough with hairs rad sin.-tooth nar at base, caul very few cord at base ½ stem-clasp
9139 Silicles smooth rough with elevated dots on the disk, Leaves hairy generally radical oblong
9140 Silicles smooth rough with elevated dots on disk, Lvs. mostly radical erect linear lanc. hoary nearly entire

9141 Silicles scabrous with a persistent subulate style, Cauline leaves stalked lanceolate

9142 The only species

9143 The only species

9144 Upper joint of the silicle ensiform

9145 Silicles smooth . upper joint ovate longer than style, Leaves pinnatifid, Lobes toothed cut acute

9146 Silicles downy upper joint round rugose shorter than style, Leaves blunt toothed, radical sublyrate

9147 Silicles furrowed smooth, Leaves oblong toothed sinuated

9148 Silique and leaves smooth upper lanceolate toothed, lower pinnatifid

9149 Siliques and leaves nearly smooth, Leaves all sinuate pinnatifid

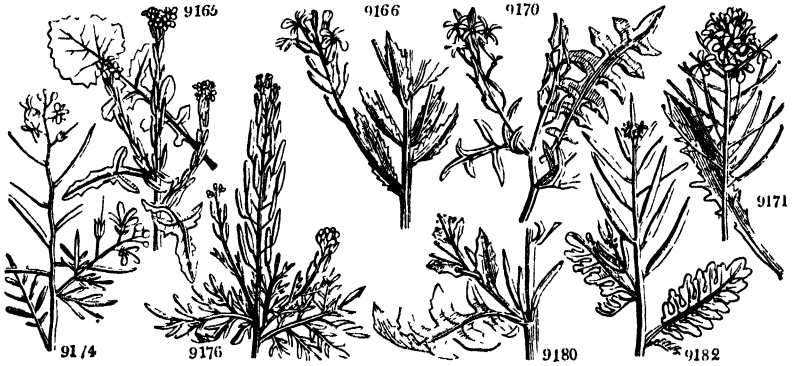
9150 Stem branched diff Lvs lanc somew toothed, Down 2-4-parted, Pedi shorter than persist cal Silq rough
9151 Stem erect simple, Lvs obl cut tooth Down 3-parted, Pedi shorter than decid cal Silq smth about 4-cor
9152 Stem branched somew hairy at base, Lvs ov acute toothed angul and silq smooth, Pedi shorter than cal.
9153 Stem erect branch Lvs obov ent Down 2-parted app Pedi length of cal Silq round pub Style very short
9154 Stem erect branched, Lvs ellipt blunt ent narr at base, Down appr 2-4-parted, Pedicels shorter than cal
9155 Stem erect branched, Lvs lanc acute lower toothed sess Down stel Pedi very short, Pods torulose subul
9156 Stem erect branched, Lvs obl blunt nearly ent Down tom stel Pedicels finally as long as cal Pods pubesc.
9157 Stem erect branched, Lower lvs lyrate stalked blunt, Down app 2-part Pedicels length of cal Pods pubesc.
9158 Stem compound erect, Leaves lanceolate linear nearly entire hoary, Pedicels length of cal Pods hoary

9159 Pedicels very long spreading stiff as broad as silique which is thickened at each edge, Petals obl oblique
9160 Pedicels shorter than cal Petals obovate oblong, Leaves obovate cut-toothed, Stem hispid
9161 Pedic longer than cal Petals obov. somew pointed, Lvs downy lower lyrate runcinate, upper lanc acum.

9162 Pedicels length of cal Petals obov Silq erect torose smooth not thickened at edge, Lvs ovate lanc toothed

9163 Pedicels glandular hairy length of cal Petals obovate, Leaves oblong blunt and stem simple ciliate hispid
9164 Pedic scarcely so long as cal. Petals obovate, Leaves somewhat radical somewhat fleshy lanc Scape simple

and Miscellaneous Particulars.



1418 *Rapistrum*, that is to say, resembling *Rapa* A genus very near Cakile, from which it differs in having yellow flowers, and leaves not fleshy, and more or less hairy

1419 *Chorispora* From χωρις, separately, and σπορα, seed, each seed being enclosed separately in the pod. This differs from Raphanus in having flat decumbent cotyledons, not folded incumbent ones Little annual plants

1420. *Malcomia* Named after Mr William Malcolm, an eminent nurseryman in the neighbourhood of London, and a person of some botanical acquirements M maritima is a common annual, which, sown at different times, or left to sow itself, will be in flower nearly all the year

1421 *Hesperis* From ἑσπερις, the evening. The flower is more fragrant towards evening than at other periods of the day H matronalis, in its double varieties, is rather difficult to keep, and requires to be yearly renewed by cuttings It prefers a strong loamy soil, and it has been remarked, that it neither thrives in the neighbourhood of London or Paris.

History, Use, Propagation, Culture,

1422 *Sisymbrium* Σισυμβριον was the name given by the Greeks to some aquatic plant not now recognized. It appears to have had an agreeable smell Ovid advises that Venus should be propitiated with garlands of myrtle, of roses, and of Sisymbrium S officinale is a celebrated medicinal plant, and esteemed diuretic, detersive, and expectorant, and prescribed in asthma and hoarseness, whence the French call it *Herbe aux chantres*

1423 *Alliaria* From *allium*, garlic, in allusion to the smell of the leaves of this plant, for the sake of which it was formerly used in salads

1424. *Erysimum* From ερυω, to cure, on account of the salutary effects of this plant in medicine It is even now reckoned a powerful cure for the sore throat The plant of the ancients appears to have been our garden cress, for Pliny says the Gauls called his Erysimum *velar*, and the garden cress is to this day called *velhar* in

9165 Leaves runcinate hairy, Stem hairy, Siliques subulate appressed to the rachis
9166 Leaves lanceolate stalked toothed pubescent
9167 Leaves smooth glaucous lower stalked runcinate pinnatifid, upper linear lanceolate entire
9168 Leaves lanc toothed sessile smooth, Stem branched divaricating, Siliques erect roundish smooth [base
9169 Leaves pinnated, Lobes oval oblong blunt sinuate-toothed with rounded recesses, Stem hispid backward at
9170 Stem and lvs smth rad runcin, caul pinnatifid, Lobes and recesses acute, Cal much spread Pods rough
9171 Stem pods and lvs smooth · rad runcin, cauline cut or pinnatifid, Lobes and recesses acute, Cal. spreading

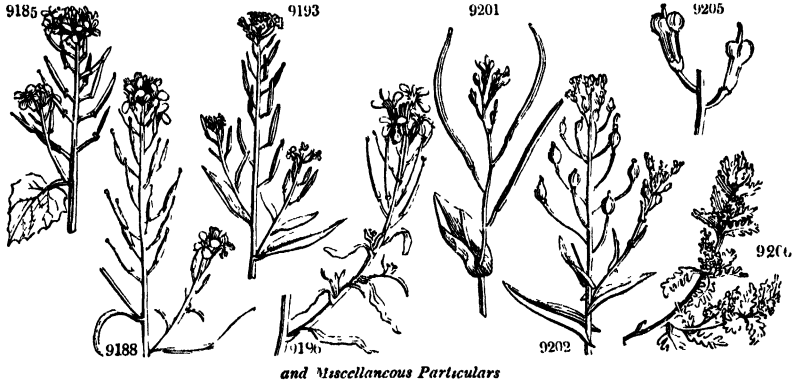
9172 Stem and leaves smooth runcinate pinnate, Lobes toothed terminal elongated, Cal and pods spreading erect
9173 Stem villous somew hoary, Leaves runcinate pubes Lobes toothed or ent acute, Pods nearly erect, Cal lax

9174 Lower leaves runcin hispid with toothed lobes upper pinnated smooth with lin ent lobes, Pods spreading
9175 Lvs smth pinnat. with obl blunt somew tooth lobes, Pedic very sh Pods muric rough point with sh style
9176 Leaves bipinnate with oblong linear cut lobes, Pedicels 4 times as long as calyx, Petals smaller than calyx
9177 Leaves about 3-pinnate hoary with very small blunt lobes, Stem ½ shrubby, Petals larger than calyx
9178 Lvs pinnated, Segm lanc cut serrated outer confluent, Petals larger than calyx, Pods shorter than stalk
9179 Pedic axillary very short solitary, Pods erect downy, Leaves sinuate pinnatifid, Stem downy backwards
9180 Pedic about 3 axill very short, Pods erect smooth, Lvs sinuate runcin Lobes acute toothed lowest largest
9181 Pedic very short axill or naked, Pods and stems erect hispid, Leaves smoothish obl acutely runcin-pectin
9182 Leaves lyrate pinnatifid smooth, Stem erect leafy, Pedicels thick shorter than calyx
9183 Rad leaves lyrate cauline pinnat. Lobes linear ent term largest, Pedic slender almost shorter than calyx
9184 Leaves linear entire, Branches and pedicels glandular and hairy, Pods glandular

9185 Leaves cordate, Pods prismatical much longer than pedicel

9186 Leaves ovate roundish, Pods lanceolate the length of their stalk

9187 Pods length of style · when young covered by the persistent calyx, Fl sessile, Leaves linear entire
9188 Pods much longer than style when young having a persistent calyx, Fl subsessile, Leaves linear entire
9189 Pods thrice as long as style 2-edged naked, Fl on short stalks, Leaves oblong lanceolate sinuate toothed
9190 Leaves lanc toothed pubescent with a 3-parted down, Stem branched, Pods lax, Stigma 2-lobed [of pod
9191 Lvs obl lanc somew tooth pub with 3-part down, Stem straight round, Length of style great than breadth
9192 Lower leaves runcinate toothed · upper lanc undivided, Fl branches and pods comp. 4 cor erect spreading



9193 Lvs lanc somew toothlet roughish green, Pods erect spread twice as long as stalk, Stigma small subsessile
9194 Leaves linear lanc repand-toothed, subpubes Pods spreading torulose scarcely thicker than short pedicel
9195 Lvs lin entire and stem cinereous with appressed 2-parted hair, Pods somew erect, Stigma stalked emarg
9196 Lvs lin ent or somew tooth somew hoary with 2-part hair, Claws long than cal Pods erect, Stig near sess
9197 Lower lvs lanc toothed upper somewhat linear entire, Petals roundish obovate, Claws longer than calyx
9198 Leaves lanceolate toothed narrowed at base, Petals obovate oblong, Pods spreading, Style scarcely any
9199 Leaves lin obl lower toothed runcin and stem pubesc rough, Pods spreading, Style very short and thick
9200 Leaves membranous smoothed cauline cordate sagittate stem-clasping oblong, radical stalked ovate

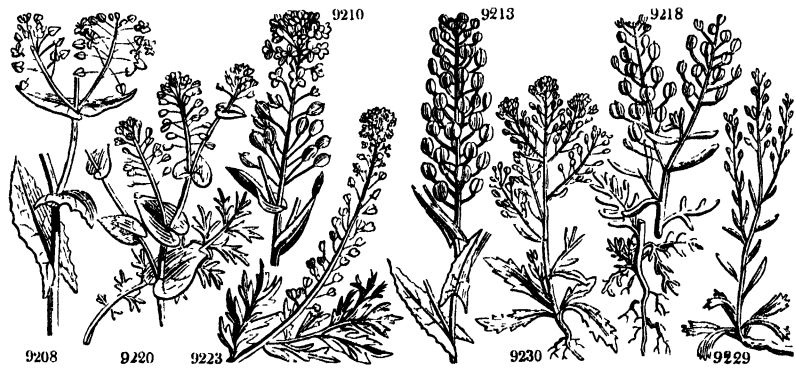
9201 Rad lvs obov cauline cordate stem-clasping, all blunt smooth glauc Sides of square stalk without nerves

9202 Pods cuneate pyriform with 4 ribs and a longish style, Leaves lanceolate nearly entire
9203 Pods roundish pyriform with 4 ribs and a longish style, Leaves repand toothed
9204 Pods globose, Leaves oblong serrate toothed bluntly stem-clasping at base, Stem smooth

9205 The only species

9206 Leaves pinnatifid, Lobes oblong toothed or cut, Pods compressed twin netted
9207 Lvs pinnatifid, Lobes ent toothed or pinnatifid, Pods somew acute compressed with crested rugose valves

and Miscellaneous Particulars



the Basque tongue, and in other dialects of France *beler* or *veler* From the seeds of E. perfoliatum, a plant not known in this country, oil for lamps is expressed in Japan

1425 *Camelina*; that is to say, *chamæ-linum*, dwarf flax C sativa is cultivated in many parts of Europe for the seeds, from which oil is obtained For the method of its culture see Parmentier, in Roz *Cours d'Agric*, *v* xi. *p* 291 Bosc *Dict d'Agr* 3 *p* 45 Gallız *Bot Ag*ı 3 *p* 170

1426 *Neslia* A name first employed by M Desvaux, but not explained by him A genus allied to Camelina, but well distinguished by its one-seeded indehiscent silicles

1427 *Coronopus* From κορωνη, a crow, and πους, a foot The leaves are deeply cut, and resemble the feet of a bird Coronopus Ruellii was formerly gathered and used as a salad, but has long since been deservedly neglected. C. niloticus is said, by Delile, to be used in Egypt for the same purpose.

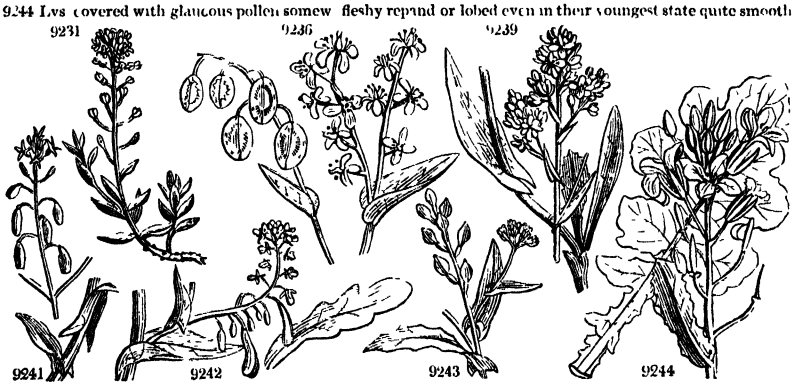
History, Use, Propagation, Culture,

1428 *Lepidium* From λεπις, a scale The form of the silicles is that of little scales L piscidium is used by the natives of the Society Islands for the purpose of catching fish by inebriating them It was used by the English voyagers as a salad, but it was very pungent L. oleraceum is a powerful antiscorbutic, and is found of great service to the crews of ships visiting New Zealand, it resembles lettuce in taste, and acts as a moderate aperient L sativum, the common garden cress, is a salad-plant known to every one, and which even the cook can cultivate on moistened cloth or wool in a moist heat Watering with water, impregnated with muriatic acid gas, or electrifying, will facilitate the germination and developement of the seeds

1429 *Æthionema* So named by Mr R Brown, apparently in allusion to some tawny or sunburnt tinge in the stamens From αιθω, to scorch, and νημα, a stamen *Smith*

1430 *Isatis* From ισαζω, to render equal The plant was believed to destroy, by its simple application, all roughness and inequalities of the skin It was formerly called *glastum*, from the Celtic *glas*, blue, whence *Glastonbury* derived its name The ancient Britons colored themselves with the blue preparation obtained from this plant, whence they received their appellation, *Britho* being the Celtic word for to paint The Picts were so named by the Romans for the same reason On account of the brightness of its manufactured colors the Celts called it *gwed* (*guesde*, French, at this day), whence the Anglo-Saxons obtained their name of *waad* or *wad*, and the English the word *woad* I tinctoria is in occasional cultivation for its leaves, from which a dye, as a substitute for indigo, is obtained The seeds are sown on well prepared land in good heart; fresh broken old pasture land is preferred, and the great object is to have large leaves, for which purpose, as Miller observes, the culture given by the best gardeners to spinage should be imitated, that of sowing on a very rich well pulverised soil, thinning the plants so as they may not touch each other, keeping them perfectly clear of weeds, and frequently stirring the soil between the plants The culture applied to the turnip in Northumberland would succeed well with woad The seeds are sown in July, and the plants, when they come up, weeded and thinned, next July, or earlier, the first crop of leaves may be gathered, and two or three others will be ob-

9208 Pods cordate somewhat turgid entire at the end exceeded by the style, Leaves stem-clasping lanc toothed
9209 Pods elliptical twice as long as stalk, Style filiform, Leaves with acute stem-clasping lanceolate auricles
9210 Pods ellipt smooth shorter than stalk, Style filif Leaves with blunt stem-clasping obl bluntly toothed auric
9211 Pods ellipt ent somew. downy pointed with style, Cal somew persistent, Rad lvs pinnat. : caul. lin. ent.
9212 Pods orbicular winged, Leaves variously divided and cut, Branches not spiny
9213 Pods ovate winged emarginate scaly, Cauline leaves sagittate toothed
9214 Pods ovate winged emarginate hairy, Cauline leaves sagittate villous nearly entire
9215 Pods oblong winged emarginate about 2-horned smooth, Radical leaves pinnatifid with cut lobes
9216 Pods orbic emarg shorter than stalk, Flowers with 2-4-stamens, Caul. lvs lin. lanceol cut-serrate smooth
9217 Pods ovate somewhat emarginate, Leaves subulate entire, Stem ♃ shrubby
9218 Pods ovate emarg spreading shorter than stalk, Leaves smooth radical pinnatifid, Fls diandrous apetal.
9219 Pods elliptical slightly emarginate, Leaves pinnatifid, Lobes linear, Joints of stem inflated
9220 Pods ellipt slightly emarg Lower lvs stalked pinnatifid with multifid lobes upper cord. amplexicaul entire
9221 Pods oval somewhat emarginate, Leaves pinnatifid with oval entire lobes terminal large roundish
9222 Pods oval somew emarg approximat Lower leaves pinnati with spread acute lobes, Stem much branched
9223 Pods orbicular emarginate, Flowers diandrous, Leaves all pinnately multifid minutely ciliated
9224 Pods oblong obovate emarginate, Stigma exserted, Leaves oval-oblong toothed outwardly or entire
9225 Pods ovate acutish, Leaves smooth ellipt-oblong deeply serrated upper entire somewhat serrated at end
9226 Pods ovate pointed with stigma, Lower lvs stalked lyrate pinnatifid, Lobes cut toothed · term very large
9227 Pods ovate pointed with the stigma, Leaves ovate lanceolate undivided subserrate, lowest on long stalks
9228 Pods ovate pointed with stigma, Leaves smooth somew fleshy entire, Rad stalked ovate caul sess sagitt
9229 Pods elliptical pointed with stigma, Stems ♃ shrubby, Radical lvs obov obl toothed cauline linear entire
9230 Pods ovate pointed with stigma, Rad leaves cut or pinnatifid cauline linear entire, Stem much branched



9231 Silicles 2-celled many-seeded obcordate, Valves winged at back and entire, Racemes in fruit lax
9232 Silicles 2-celled 2-seeded round emarg at base and end, Racemes very close, Valves winged at back and ent.
9233 Silicles 1-celled 1-seeded not opening emarginate at end, Leaves oval or obovate

9234 Silicles round cordate at base with a wide margin pointed with the style
9235 Silicles obov with a broad edge cuneate at base very blunt and emarginate at end, Stem and leaves smooth
9236 Silicles oval-oblong blunt at each end with a leafy winged margin 3 times as long as broad
9237 Silicles elliptical blunt at each end with a coriaceous winged edge three times as long as broad
9238 Silicles obl cuneate very blunt truncate emarginate narrowed at base, three times as long as broad
9239 Silicles cuneate accuminate at base somewhat spatulate at end very blunt three times as long as broad
9240 Silicles oblong narrowed at base bluntish at end four times as long as broad [at end
9241 Silicles elongate-cuneate downy four times as long as broad and twice as long as the stalk which is obconical

9242 Silicles lin blunt villi with reversed down eight times as long as broad and three times as long as their stalk

9243 The only species

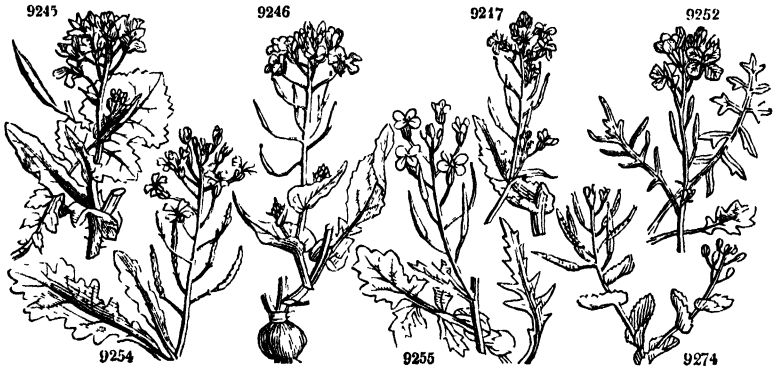
9244 Lvs covered with glaucous pollen somew fleshy repand or lobed even in their youngest state quite smooth

and Miscellaneous Particulars

tained during the season The end of the second year the plants may be ploughed down, as the third year they will run to seed, and yield but small leaves The leaves are pressed, and the juice treated as in making indigo (see *Indigofera*), but such is the cheapness of the latter article, that no British farmer can affbrd to raise any sort of substitute

1431 *Myagrum* An ancient plant, so named from its properties of catching flies, which the modern plant does not possess, μυια, a fly, αγρα, capture

1432 *Brassica* The etymology of this word has been explained with great learning and ingenuity by Vossius, Ray, Dalechamp, and others It comes, however, from the Celtic *bres*, which signifies a cabbage This genus affords the well known pot herbs and roots, and also the oil plant rape, extensively cultivated in agriculture There is scarcely an instance in the vegetable kingdom of a plant that produces varieties so different in appearance and qualities as the B oleracea, comparing the original plant as it is found on our shores, with wavy sea-green leaves, no appearance of a head, and flowering like wild mustard or charlock, with the red cabbage or cauliflower, the difference is astonishing A new arrangement of the cultivated species of Brassica has been made by Professor Decandolle (*Hort Trans* vol 1, and in his *Reg Veg*), whose varieties, or races of B oleracea, are stated above



The *colza* of the Dutch he makes a distinct species (B campestris), and also the turnip (B rapa), the rape (B napus), and the summer rape of the Germans (B præcox)

In Hungary, in the territory of Alba, the B elongata is cultivated for its oil, for which purpose it is said to be better adapted than any other species

The culture of all the Brassica tribe is so universally known that it would be a waste of space in a work of this sort to enlarge on it They all prefer a loamy soil, well enriched with manure, and manures of the strongest kind, as nightsoil, offals from the shambles, blood, &c are not found too powerful for common cabbage or cauliflower. The turnip prefers a lighter soil than the cabbage tribe, but it must be well manured, and if the

History, Use, Propagation, Culture,

manure be well fermented, so much the better for the garden turnip, in the fields, where it is buried in rows or drills, more littery dung will succeed

The field culture of the turnip is become an important part of the agriculture of light soils, the best mode is by drills, as in Berwickshire and Northumberland, where are produced crops of treble the weight of those grown in the broad-cast manner in Norfolk In the latter county a crop weighs from five to fifteen tons per acre, in Northumberland from twenty-five to thirty tons, and in Ayrshire as many as sixty tons have been raised on the statute acre (*Encyc of Agric*)

The cabbage has been tried as a field plant, but, though it has been said by Sinclair (*Hortus Gram Wob*) to produce more nutritive matter than either turnips or field beet, professional farmers have not found it to answer

Of all the Brassica tribe it may be observed, that they attain to much the greatest perfection in temperate climates, such as those of Britain and Holland Without constant and liberal supplies of water, they are small in size, and rigid or stringy in texture In France and in Italy, and warm climates, it is only the cauliflower and broccoli that attain a large size, and that, in Italy at least, is during the coldest months of the year, and aided by liberal waterings But in Tarragona the cauliflower is said to reach the enormous weight of 40 lbs

1433 *Sinapis* In Greek σινάπι, said to be derived from *nap*, the Celtic designation of all plants resembling the turnip or cabbage. Our English word *mustard*, and the French *moutarde*, are modernizations of *mustum ardens*, hot must, the sweet must of new wine being one of the ingredients of the French mustard for the table The seeds of all the species are hot, acrid, and will afford an oil by expression, and a powder or meal by drying and grinding, which might serve as the condiment mustard S nigra is more particularly adapted for the latter purpose, though it is often mixed with the seeds of S alba and arvensis, and often with those of the

9277 Pods sessile nearly erect, Style ensiform, Leaves sessile runcinate lyrate toothed

and Miscellaneous Particulars

Brassica and Raphanus genera Both S alba and nigra are grown as small salads to be eaten with cress, they are sown as thick as the seeds will lie, in pots or boxes, or in the area of forcing-houses, in the winter season, and forced, or in beds in the open air, and cut as soon as the seed leaf is fully expanded For flower of mustard, or for the seed for oil or medical purposes, both white and black sorts are sown in the fields in rich well pulverized soil, in March or April, and kept free of weeds The crop ripens in July and August, and is either threshed immediately or stacked like other grain It is like other oleiferous seeds, exhausting for the soil, and such seeds as drop and are buried, will retain their vegetative qualities for an unknown length of time, so that where mustard has once been grown, it will come up occasionally for a century or more afterwards

It the seeds, Dr Cullen observes, be taken fresh from the plant and ground, the powder has little pungency, but is very bitter, by steeping in vinegar, however, the essential oil is cooled, and the powder becomes extremely pungent In moistening mustard-powder for the table, it may be remarked, that it makes the best appearance when rich milk is used, but the mixture in this case does not keep good for more than two days The seeds of both the black and white mustard are often used in an entire state medicinally Half or a quarter of a wine glass of mustard seeds, swallowed fasting, about five in the morning, is the most powerful tonic and strengthener of the digestive organs which is known

1434 *Moricandia* Named by Decandolle, after his friend Stephen Moricand, author of the Flora Veneta, and an excellent Italian botanist M hesperidiflora is a favourite food of the camel, notwithstanding its intense acridity

1435 *Diplotaxis.* From διπλοος, double, and ταξις, arrangement, on account of the double rows of seeds in each cell.

History, Use, Propagation, Culture,

1436. *Eruca* The meaning of this word is involved in obscurity According to Isidore, of Seville, a learned Spaniard, who died in 636, and left a book of etymologies, *eruca* is an alteration of *urica*, derived from *uro*, to burn From *eruca*, the Italians formed *ruchetta*, the French *roquetta*, and the English *rocket* E sativa is very pungent in the foliage, and is used as a salad in the South of Europe for its aphrodisiacal powers.

" *Excitat ad venerem tardos Eruca maritos* "

1437 *Vella* Latinized from *valer*, the Gallic name of the cress A pretty low shrub, with beautiful yellow flowers appearing in the early spring It is hardy enough to live through the winter in a dry warm south border

1438 *Carrichtera* An unexplained name, first used by Adanson A small annual plant, with pinnated leaves, and long erect racemes opposite to the leaves Flowers small, pale yellow.

1439 *Succowia* In honor of Professor Suckow, a learned botanist of Heidelberg An annual, with the habit of the last, from which it differs in its subulate style and solitary seeds

1440 *Zilla* The Egyptian name of the plant, which is a large glabrous herb, with round white branches and oblong toothed leaves, which are boiled and eaten by the Arabs like those of cabbage

1441. *Calepina* A name used by Adanson, the meaning of which is unknown This plant has been transferred by one author or another to almost every genus of Siliculosæ, but appears to be really akin to Crambe only, from which it differs in its sessile and purely unilocular silicle, in its stamens having no teeth, and in the outer petals being larger than the others

1442 *Crambe.* One of the names applied by the Greeks to the cabbage, and especially to the marine cabbage. C maritima grows on sandy shores in the west of England, and there the common people have from time immemorial been in the practice of watching when the shoots and leafstalks begin to push up the sand

9278 Pods sess nearly erect, Style roundish 1-2-sced Lvs pinnatif with cut lobes and lin. sinuate toothed segm.
9279 Pods somewhat stalked erect, Style filif short without seeds, Upper lvs entire lower pinnatifid compound

9280 Pods sess erect, Style short somew. filif Rad lvs toothed or lyrate smooth, Stems nearly naked ascending

9281 Pods sess erect, Style short somew filif Rad. lvs runcinate toothed hispid, Stems naked erect
9282 Pods sess. erect, Style short somew filif Rad lvs lyrate very blunt smooth, Stems naked decumbent
9283 Pods sess erect narrowed at base, Style short conical, Rad. lvs pinnatifid thickish with entire lobes

9284 Lvs lyrate pinnated with toothed acute lobes, Stem hirsute, Pedicels shorter than deciduous calyx
9285 Lvs pinnatifid, Lobes acute nearly entire, Stem hirsute, Calyx persistent somewhat bladdery

9286 The only species

9287 The only species

9288 The only species

9291 Long filaments forked, Pod blunt, Leaves roundish sinuated wavy toothed glauc and stem quite smooth
9292 Long filaments forked, Pod blunt, Leaves pinnatifid with obl acute toothed lobes, Stem smooth
9293 Long filaments forked, Pod blunt smooth, Leaves pinnatind toothed rough, Stem smooth [smoothish
9294 Long filam forked, Pod blunt, Rad lvs decompound, Pinnae cut toothed younger rough, old and stem
9295 Long filam forked, Pod blunt rugose, Lvs pinnated with obl lin toothed lobes and stem rough
9296 Long filam forked, Pod nearly blunt, Lvs stalked toothed lower cord, upper ov and stem nearly smooth
9297 Long filam toothed, Pod blunt, Lvs lyrate rough, Termin al lobe cord orbicular
9298 Long filam scarcely toothed, Pod blunt, Lvs pinnate-lyrate hairy, Termnal lobe ovate
9299 Long filam toothed on one side, Pod mucronate, Lvs lyrate pinnatifid toothed hoary
9300 Filam not toothed, Pod mucronate, Lvs ov toothed unequal and somew. auricled at base and stem hispid

9301 Pods round torose acuminate scarcely longer than stalk

9302 Pods depressed acuminate decumbent longer than the whole plant
9303 Pods 1-celled jointed striated 8-seeded longer than the style, Lvs simply lyrate
9304 Pods 1-celled jointed substriated 2-6-seeded longer than the subulate style, Lvs interruptedly lyrate
9305 Pods 1-celled jointed striated 2-6-seeded, Style conical shorter than the last joint, Lvs interrupted lyrate

and Miscellaneous Particulars

and gravel, in March and April, when they cut them off under ground, as is done in gathering asparagus, and boil them as greens About the middle of the last century the plant was first introduced into gardens, grown on deep sandy soil, and blanched either by sand, ashes, litter, or by covering with flower pots, earthen pots made on purpose, or any opaque cover It is now almost as universal in good gardens as asparagus, and like it is forced either by taking up the roots and planting them on a hotbed, or in the border of a forcing house, or by covering or surrounding them with litter in the open garden Before covering a bed with warm litter, each plant or stool of plants is covered with an earthenware blanching pot or a wicker case, to keep off the dung from the young shoots, and to ensure their being blanched No plant is so easily forced, and, unlike asparagus, it yields produce the first spring after raising from seed

C tataria is called by the Hungarians *Tatar-Kenyer* or Tartarian bread, and its root, stripped of the bark and sliced, is eaten with oil, vinegar, and salt The boiled root is sweet, and eaten by children The young shoots are boiled like those of sea kail, and have an excellent taste, but are stringy, which they would not be if well cultivated, which the plant appears to deserve

1443 *Raphanus* From $\rho\alpha$, quickly, and $\phi\alpha\iota\nu o\mu\alpha\iota$, to appear, on account of the rapidity of its germination and arriving at perfection R sativus is a well known salad root, requiring a deep sandy soil to attain a large size There are several varieties both of the spindle-shaped and globular rooted kinds, and a very distinct sort known as the black or Spanish radish In the Horticultural Transactions, sixteen varieties are mentioned besides subvarieties, arranged as spring, summer, turnip, autumn, and winter radishes They are all of easy culture, and the spring, summer, and turnip sorts force well on hot-beds, or on dung-beds covered with mats

R caudatus, or tree radish, is remarkable for the length of its pod, which is greater than the whole height of the plant The young leaves of R Landra are eaten by the inhabitants of Insubria as salad.

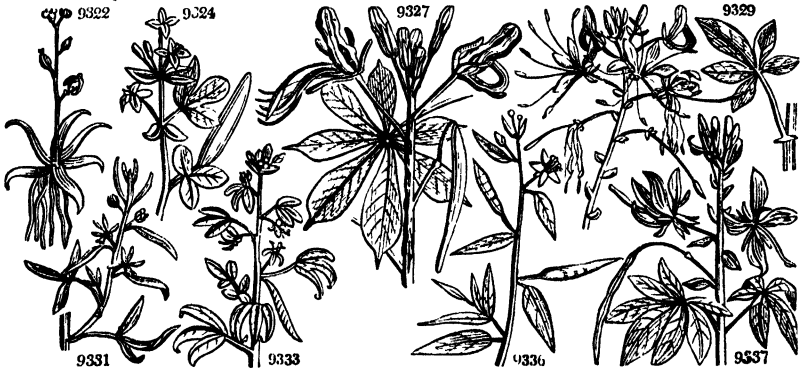
History, Use, Propagation, Culture,

1444 *Bunias* From βουνος, a hill, because the plants grow upon exposed open situations *Linn.*

1445 *Erucaria* See Eruca, No 1437 Plants with the habit of Cakile

1446. *Heliophila* From ἡλιος, the sun, and φιλεω, to love, a plant loving heat All the species grow upon dry hot plains at the Cape of Good Hope These are mostly beautiful annual or perennial plants.

9306 Pods 4-cornered. angles crested, Radical leaves runcinate
9307 Pods 4-cornered angles crested, Leaves all lanceolate
9308 Pods ovate 2-celled not crested somewhat warted



9309 Pod style-bearing, Lvs pinnated, Lobes linear of the lower pinnatifid, of the upper entire
9310 Stigma sessile, Beak longer than pod, Lvs. pinnated thick, Lobes linear

9311 Smooth, Pods rounded narrowed at each end, Leaves linear subulate
9312 Smooth, Pods moniliform, Lower lvs opp upper altern cord stem-clasping obl entire
9313 Smooth, Pods moniliform pendulous, Lvs pinnated in 3-5-pairs, Lobes linear entire
9314 Hispid, Pods linear, Lvs hairy either linear entire or trifid at end and cuneate at base
9315 Hispid, Pods linear, Lvs oval entire or here and there coarsely cut-toothed
9316 Smooth, Pods linear, Leaves pinnated, Lobes and rachis linear entire
9317 Downy, Pods linear spreading, Lvs pinnated or bipinnated lobes filiform
9318 Velvety, Pods linear nodding, Lvs pinnated somewhat fleshy lobes subfiliform furrowed above
9319 Smooth, Pods linear erect or pendulous, Lvs fleshy half round
9320 Pods linear compressed velvety, Style thick conical smooth, Leaves oblong
9321 Pods compressed stalked, Leaves linear lanceolate

9322 The only species

9323 Polyandrous hairy, Lvs 5-7 cuneiform rough, Racemes term Pods filiform
9324 Flowers dodecandrous, Leaves quinate and ternate
9325 Flowers dodecandrous, Leaves ternate
9326 Flowers gynandrous, Leaves quinate, Stem unarmed
9327 Flowers hexandrous, Leaves 7, Stem unarmed
9328 Flowers hexandrous, Leaves 7-5, Stem spiny
9329 Flowers hexandrous, Leaves quinate viscid, Stem spiny

9330 Prickly hexandrous, Leaves quinate and ternate floral simple, Stigma dilated
9331 Flowers hexandrous, Leaves ternate and solitary, Leaflets lanc lin entire
9332 Unarmed, Lvs 5 lower and floral 3, upper sessile ovate, Pod smooth as long as its stalk
9333 Flowers hexandrous, Leaves ternate, Leaflets oval lanceolate
9334 Flowers hexandrous, Leaves ternate lanceolate blunt, Pods fusiform viscid
9335 Flowers hexandrous, Leaves simple ovate-lanceolate stalked
9336 Flowers hexandrous, Leaves simple lanceolate stalked, Stems procumbent
9337 Unarmed pubescent, Leaves 5-7 floral simple cordate, Pod the length of the stalk

and Miscellaneous Particulars

1447 *Subularia* From *subula*, an awl, on account of the form of the leaves. A curious little aquatic, not of common occurrence

1448 *Cleome.* A name employed by Octavius Horatius, a Latin physician, who lived in the fourth century, to designate a plant resembling Sinapis, and growing in humid places. It appears to have had no relation to the modern plant.

CLASS XVI. — MONADELPHIA.

THIS class is distinctly characterized by the filaments being united together throughout the whole or a part of their length, and for the most part consists of plants belonging to the natural orders of Malvaceæ and Geraniaceæ. Of the former, the major part are of little moment, consisting, in a great measure, of weeds or worthless shrubs of various parts of the world. Among them, however, are some plants both of interest and ornament, especially the beautiful Astrapæa, and the various species of Bombax and Hibiscus. The Gossypium, so important as producing the material of cotton, and the Adansonia or Baobab tree of Africa, remarkable for its immense size and use as an article of food, are found in this class. The Geranium, Camellia and Passion flower are also genera of much beauty, the latter yielding the well known West Indian fruit called the Grenadilla. The common Tamarind, with which this class commences, would more properly be placed in the next, and the succeeding genera of Patersonia, Tigridia, Ferraria, and Galaxia, are in every respect, except the union of their filaments, referable to the third class.

Order 1. TRIANDRIA  Stamens 3

1449 *Tamarindus* Petals 3, ascending. Three filaments longer than the others and fertile. Legumen 1-5-celled, pulpy inside.
1450 *Patersonia.* Cor tubular. Limb 6-parted, with 3 small segments. Caps 3-celled, inferior.
1451 *Ferraria.* Spatha 2-leaved. Cal. 0. Petals 6, wavy, curled. Filaments united at base. Style 1. Caps. 3-celled, interior.
1452 *Tigridia.* Spatha 2-leaved. Cal. 0. Petals 6, the 3 outer large. Filaments united into a very long tube.
1453 *Galaxia.* Spatha 1-leaved. Cal. 0. Corolla monopetalous, 6-cleft, with a long tube. Style 1. Capsule 3-celled, interior.

Order 2. PENTANDRIA.  Stamens 5.

1454 *Waltheria.* Cal. 5-fid, with a lateral deciduous 3-leaved involucre. Petals 5. Style 1. Stigma pencilled. Caps. 1-celled, 2-valved, 1-seeded.
1455 *Hermannia.* Cal. nearly naked, campanulate, 5-fid. Pet. 5. Stamens 5. Filaments united at base, lanceolate, frequently winged. Styles 5, cohering in one. Caps. 5-celled, 5-valved, many-seeded.
1456 *Melochia.* Cal. 5-fid, naked, or with 1-5 bracteæ. Petals 5, spreading. Stam. 5, monadelphous at base. Styles 5. Caps. 5-celled. Seeds 1-2 in each cell.
1457 *Melhania.* Cal. 5-parted, persistent, with a 3-leaved involucre on one side. Pet. 5. Stam. 10, alternately sterile the fertile ones bearing from 1-2 anthers each.
1458 *Ochroma.* Cal. double, outer 3-leaved. Petals 5. Anthers anfractuose. Capsule 5-celled, many-seeded. Seeds involved in wool.
1459 *Passiflora.* Cal. 5-parted, colored. Petals 5 or 0, inserted in the calyx. Crown of many filiform rays. Fruit stalked, fleshy.
1460 *Erodium.* Cal. 5-leaved. Petals 5. Scales 5, alternate, with filaments and honey glands at the base of the stamens. Cocci 5, 1-seeded, awned, at the base of a rostrate receptacle.

Order 3. HEPTANDRIA  Stamens 7.

1461 *Pelargonium.* Cal. 5-parted, the upper segment ending in a nectariferous tube running down the peduncle. Cor. 5-petalous, irregular.

Order 4. OCTANDRIA  Stamens 8

1462 *Antonia.* Cal. 4-parted. Cor. 4 petals. Style 1. Berry dry, quadrangular, 1-celled, many-seeded.

Order 5. DECANDRIA.  Stamens 10

1463 *Geranium.* Cal. 5-leaved. Petals 5, regular. Glands 5, honey-bearing, united to the base of the longer filaments. Cocci 5, 1-seeded, awned, at the base of a beaked receptacle.

Order 6. DODECANDRIA  Stamens 12

1464 *Brownea.* Cal. tubular, bifid. Cor. double, outer 5-fid, inner of 5 petals. Legumen 1-celled.
1465 *Monsonia.* Sepals 5. Pet. 5. Stamens 15, united, their cup 5-fid. Style 5-fid. Cocci 5, 1-seeded awned, at the base of a beaked receptacle.
1466 *Helicteres.* Cal. tubular, obliquely 5-fid. Petals 5. Germen on a long stalk. Style about 5-fid. Caps 5, 1-celled, many-seeded, spirally twisted.
1467 *Dombeya.* Cal. double, outer 3-leaved, deciduous. Petals 5. Stamens 20, of which 5 are sterile. Style 5-fid. Caps 5, united, 1-celled, 1-many-seeded.
1468 *Pentapetes.* Cal. double, outer 3-leaved, deciduous. Petals 5. Stamens 20, of which 5 are barren. Style obsoletely 5-toothed. Caps 5-celled, many-seeded, with contrary dissepiments.
1469 *Astrapæa.* Flowers umbellate, with an involucre. Involucre many-leaved, unequal. Cal. simple, 5-leaved, with 1 bract. Petals 5, convolute-closed. Stamens 25, united into a tube bearing the corolla. 5-sterile.
1470. *Pterospermum.* Cal. simple, 5-parted. Petals 5. Stamens 20, of which 5 are sterile. Style cylindrical, Stigma thickish. Caps woody, 5-celled. Seeds winged.

Order 7. POLYANDRIA.  Stamens indefinite in number.

1471. *Malope.* Cal double, outer 3-leaved. Capsules heaped without order, 1-seeded.
1472 *Malva* Cal double, outer 3-leaved Capsules many, 1-seeded
1473. *Kitaibelia* Cal. double, outer 7-9-fid Caps. clustered in a 5-lobed head, 1-seeded
1474 *Althæa* Cal double, outer 6-9-fid Capsules many, 1-seeded
1475 *Lavatera.* Cal double, outer 3-fid Capsules many, 1-seeded
1476 *Malachra* Common calyx 3-leaved, many-flowered, large Caps. 5, 1-seeded.
1477. *Urena* Cal double, outer 5-fid Capsule 5-celled, 5-partible, with close 1-seeded cells
1478. *Pavonia* Cal double, outer many-leaved Stigmas 10 Capsules 5, 2-valved, 1-seeded
1479. *Achania.* Cal double, outer many-leaved Cor convolute, closed. Stigmas 10. Berry 5 celled, 5-seeded.
1480. *Hibiscus* Cal double, outer many-leaved. Stigmas 5 Capsule 5-celled, many-seeded
1481 *Gossypium* Cal. double, outer 3-fid. Caps 5 celled Seeds enwrapped in wool
1482 *Redoutea* Cal. 5-parted, surrounded by a 10-12-leaved involucre Stigmas 3 Capsules 3-celled, 3-valved, many-seeded, with three placentas alternate with the valves, and bearing on each side woolly seeds
1483 *Palavia* Cal naked, 5-fid. Capsules many, 1-seeded, united in a head without order
1484 *Cristaria* Cal naked, 5-fid Fruit orbicular, depressed, covered with a skin, and consisting of several carpella, 2-winged in the centre, and many-seeded.
1485 *Anoda* Cal naked, 5-fid Lobes acuminate, much spreading in fruit Caps. hemispherical beneath, depressed and stellate above, many-celled, with 1-celled, 1-seeded divisions
1486 *Peraptera* Cal naked, 5-fid Petals erect, spirally twisted in the tube, at length distinct. Capsule stellate, many-celled, with 1-seeded cells
1487 *Sida.* Cal. simple, angular Style many-parted Capsules several, 1 or 3-seeded
1488 *Lagunæa* Cal. simple, 5-fid Style 5-fid Capsule 5-celled, with contrary dissepiments
1489 *Ruizia* Cal double, outer 3-leaved Styles 10 Caps 10, 1-celled, 2-seeded, closely cohering
1490 *Carolinea.* Cal simple, subtruncate Filaments branched Style very long Stigmas 6 Caps woody, 1-celled, many-seeded
1491. *Adansonia.* Cal simple, deciduous Style very long Stigmas many Caps woody, 10-celled, many-seeded, with a farinaceous pulp
1492 *Bombax.* Cal 5-fid. Stamens 5, or many Caps woody, 5-celled, 5-valved. Seeds woolly Receptacle 5-cornered.
1493 *Myrodia* Cal. naked, tubular, 4-5-toothed, bursting laterally Petals oblong, linear Stamens with a long column Anthers 10-15 Capsule drupaceous, 2-3-celled, with 1-seeded cells
1494 *Gordonia.* Cal simple Style 5-cornered, with a 5-fid stigma Caps 5-celled Seeds twin, with a leafy wing
1495 *Stuartia* Cal simple, rotate Petals 5 Styles 5, united or distinct Caps 5-celled, 5 valved. Seeds solitary or twin
1496. *Camellia* Cal imbricated, many-leaved, the inner leaflets largest.
1497. *Barringtonia* Cal 4-leaved, superior Petals 4. Drupe dry, large, quadrangular, with a 4-celled nut.
1498. *Gustavia* Cal 4-6-fid Petals 4-6 Berry dry, 4-5-celled
1499. *Carcya.* Cal. superior, 4-fid Petals 4 Berry many-seeded. Seeds nestling in pulp.

History, Use, Propagation, Culture,

1449 *Tamarindus* Latinized from the Arabic name *Tamr-hindy*, or Indian date This tree is a native of the East and West Indies, of Arabia, and Egypt It is a large beautiful spreading tree. The leaves are abruptly pinnate, composed of sixteen or eighteen pairs of sessile leaflets, half an inch only in length, and one sixth of an inch broad, of a bright green color, downy, oblong, entire, and obtuse the flowers are in loose bunches of five or six, which come out from the sides of the branches the calyx is of a straw yellow color, and deciduous the petals also yellowish, and beautifully variegated with red veins, ovate, concave, acute, indented, and plaited at the edge, and the filaments purplish, bearing incumbent brownish anthers the pods are thick, compressed, and of a dull brown color when ripe those from the West Indies from two to five inches long, with two, three, or four seeds those from the East Indies are twice as long, and contain five, six, or seven seeds the seeds in both are flat, angular, shining, and lodged in a dark pulpy matter

In the West Indies, the pods are gathered in June, July, and August, when fully ripe, and the fruit being freed from the shelly fragments, is placed in layers in a cask, and boiling syrup poured over it, till the cask is filled, the syrup pervades every part quite down to the bottom, and when cool the cask is headed for sale (*Long's Jamaica*, iii 729) The East India tamarinds are darker colored and drier, and are said to be preserved without sugar Tamarinds are inodorous, and have an agreeable acid sweetish taste The acid taste chiefly depends on the citric acid, the quantity of that being greater than of the other. The pulp is refrigerant, and gently laxative The simple infusion of the pulp in warm water, or a whey made by boiling it in milk, forms a very grateful refrigerant beverage, which is advantageously used in febrile diseases The dose of the simple fruit required to act upon the bowels is so large, that it is seldom given alone as a purgative, but is generally combined with cassia or manna, the action of which it augments, or with such of the neutral purgative salts as are not decomposed by it, which is the case with those that have potass for their base, and are therefore incompatible in mixtures with this fruit. (*Thompson's London Dispensatory*, 534)

The plants thrive in loam and peat, and root under a glass in sand They form handsome objects, but in our stoves are seldom allowed sufficient room to flower Miller says, he had several plants twenty years old, and upwards, of fifteen feet high, which never had shewed blossoms.

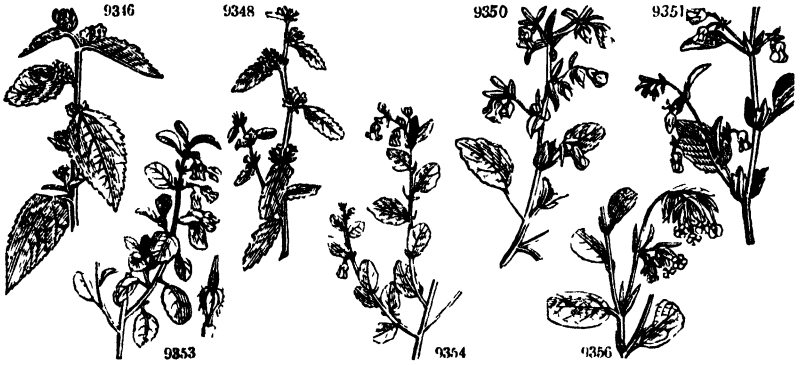
TRIANDRIA.

9338 The only species

9339 Stigma deflexed, Scape and spathes silky, Leaves ensiform straight striated
9340 Stigma deflexed, Scape and spathes smooth shining, Keel of leaves woolly at base

9341 Stem branched, Leaves equitant ensiform equal wavy, inner twice as narrow as the outer
9342 Stem simple, Leaves equitant ensiform; lower narrow

9343 Stem simple wavy, Leaves ensiform nerved, Petals flat, inner small panduriform



9344 Almost stemless, Leaves oblong, Spathe 1-valved 1-flowered

9345 Almost stemless, Leaves linear filiform dilated at base, Spathe 1-valved 1-flowered

PENTANDRIA.

9346 Leaves oval plicate acutely and unequally toothed downy, Heads stalked
9347 Leaves oval plicate bluntly toothed downy, Heads sessile
9348 Leaves lanceolate oblong blunt plicate toothed downy, Heads sessile
9349 Leaves ovate mucronate serrate and stem quite smooth, Heads stalked, Calyxes ciliated

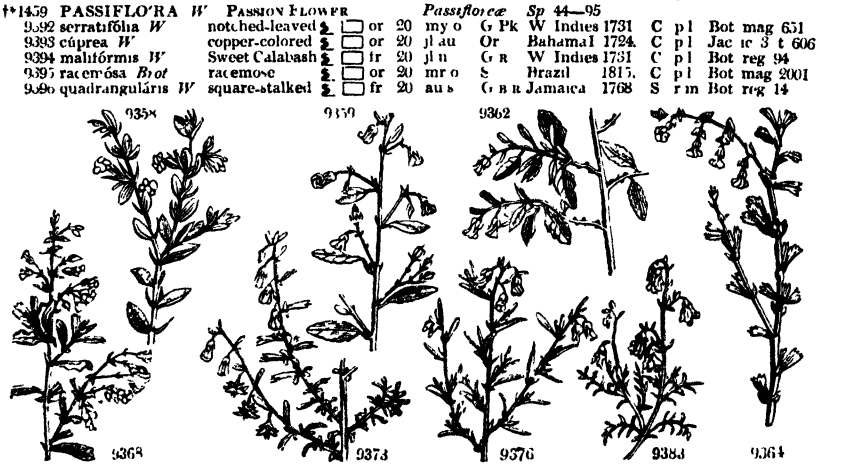
9350 Leaves ovate downy plicate crenate, Lower stipules ovate, upper broad lanceolate, Cal angular
9351 Lvs downy hairy ovate subcord. rugose denticulate, Stipules ovate acute, Cal in fl cylind finally inflated
9352 Leaves oval unequally crenate subpubescent, Stipules ovate acute often cut, Stem glandular pubescent
9353 Leaves whitish downy round ovate crenate, Stipules lanceolate subulate, Cal. campanulate spreading
9354 Leaves hispid-villous roundish-ovate blunt toothed, Stipules subovate acuminate, Cal angular
9355 Leaves downy hispid rugose oblong blunt entire subsessile, Stipules long lanceolate subulate, Fls naked
9356 Lvs downy hispid somew rugose obl very blunt a little toothed at end with short stalks Stip lanc subul

and Miscellaneous Particulars

1450 *Patersonia* Named after Colonel William Paterson, a gentleman whose remarks on the Cape of Good Hope, New Holland, and Norfolk Island, have been of much service to botany Handsome plants, which grow readily in loam and peat, and are increased like other herbaceous vegetables.

1451 *Ferraria* Named after Jean Baptiste Ferrari, an Italian botanist, author of a work on the culture of flowers, published in 1633, &c According to Sweet, "a mixture of sandy loam and peat is the best soil for the species, and they should be kept without water, after they have done growing, till they begin to grow again, when they may be planted in fresh pots and regularly watered: they are increased by offsets from the bulbs, or by seeds." (*Bot Cult* 192.)

1452 *Tigridia.* In allusion to the spotted flowers, which are marked something like the skin of a tiger Splendid plants, and tolerably hardy They do best when planted in the soil and protected by a frame or hand-glass; but will also thrive in sheltered borders, provided they are protected from the winter's frost. They ripen seeds, from which, or from offsets, they may be readily increased.



1453 *Galaxia.* Thunberg, the author of the name, has not explained its meaning Like other plants of the bulbous kind, these should be kept dry after flowering and seeding. At the return of the growing season, they should be fresh potted, and kept in a cool part of the greenhouse till they are well rooted, when they may be put into a warmer situation and regularly watered. They seed freely

1454 *Waltheria* In memory of Augustin Frider Walther, professor of medicine at Leipsic; author of Hortus Proprius, 1735 The species grow in any light rich soil, and are readily propagated. They are of no importance

1455 *Hermannia.* In memory of Paul Hermann, who practised physic in Ceylon, and at the Cape of Good Hope, and was afterwards professor of botany at Leyden He was born in 1640, at Halle, in Saxony, and died in 1695. The species are low shrubs, for the most part, with wrinkled leaves and yellow flowers, which they produce in abundance They grow freely in any light rich soil, and are readily increased in the same soil.

History, Use, Propagation, Culture,

1456 *Melochia* According to Forskahl, it is an alteration of the Arabic name *melochuch*, or *melokhiah*. Light rich soil suits all the species, and they strike readily in moist heat

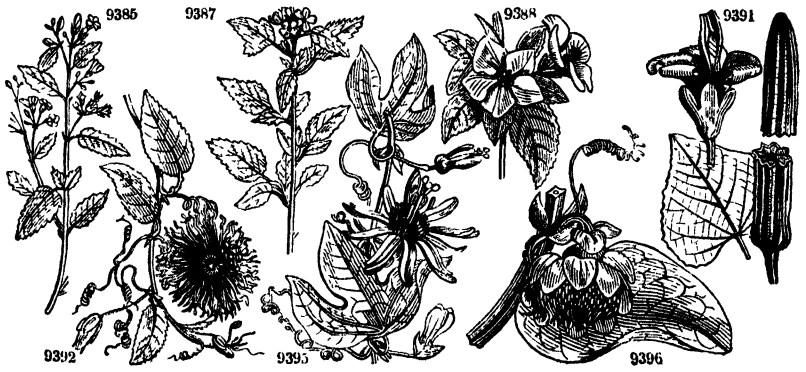
1457 *Melhania* A plant which grows upon Mount *Melham*, in Arabia Pretty plants, which grow in sandy loam, and root in sand under cover Sweet observes, that "they are very apt to become covered with insects"

1458 *Ochroma* From ωχρος, yellow, the flowers being of that color, according to Schreber O Lagopus is a very large tree, with divaricating branches, and leaves more than a foot long The wood is white, tender, and so light, that it is used instead of corks to nets The capsules contain a very soft fine rufous down, in which the seeds are involved, and which down is said to be used in the manufacture of English beavers (*Desportes Plantes de S Domingue*, iii 16)

1459 *Passiflora* This genus has been so named, on account of its being supposed to represent, in the appendages of its flower, the passion of Jesus Christ A beautiful genus of climbers, partly herbaceous, but chiefly suffrutescent or woody, and all of them exotics and very ornamental. Some species are odoriferous, others bear edible fruits, fleshy juicy berries of considerable size, though not rich in flavor Of late, a number of hybrid sorts have been raised, some of which, as P. cæruleo-racemosa, are considered more beautiful than almost any of the natural species.

P maliformis, the sweet calabash of the West Indies, produces large flowers, red, white, and blue, but of short duration They are succeeded by fruit, roundish, the size of a large apple, yellow when ripe, having a thicker rind than any of the other sorts, inclosing a sweetish pulp, in which are lodged many oblong black seeds, of a brownish color, a little rough to the touch. It grows naturally in the West Indies, where the inhabitants call it Granadilla. The fruit is served up there in desserts. It has borne fruit in the garden of the Bishop of Durham in Oxfordshire, and at Vere's, Kensington Gore (*Hort. Trans.* iii. 101.)

P. quadrangularis, the Granadilla vine of the French, has leaves five or six inches long, and luxuriant four-



9357 Leaves stalkd oval blunt wavy crenate and stem hairy, Stipules lanceolate
9358 Leaves downy hispid oblong acutish entire subsessile, Stipules lanceolate subulate, Flowers aggregate
9359 Leaves downy beneath oblong blunt crenate stalked, Stipules subulate, Pedic. 1-2-fl Calyxes spreading
9360 Leaves soft with down whitish obl blunt toothed cuneate at base entire, Pedunc. 2-fl Cal campan velvety
9361 Leaves smooth lanceolate serrate at end acute, Stipules ovate acuminate, Pedic. 2-4-flowered
9362 Leaves white with down lanceolate serrate bluntish wavy at edge, Stipules subul Pedunc 1-fl very short
9363 Leaves smooth broadly obovate cuneiform very blunt crenate emarginate plicate, Stip lanc. subulate
9364 Leaves pubescent obovate cuneiform truncate emarginate toothed, Stipules ovate acute
9365 Leaves soft white with down oblong cuneiform rounded at end toothed, Stipules lanceolate
9366 Leaves pubescent downy oblong unequally toothed rounded at each end, Stipules ovate somew toothed
9367 Leaves beneath white with down oblong obov cuneiform unequally toothed at end, Stip ½ cord acum
9368 Leaves rough above downy beneath cuneif obl unq toothed entire at base, Stip half cordate acuminate
9369 Leaves smoothish cuneiform oblong truncate toothed at end, Stipules oblong acute, Racemes few-flow.
9370 Leaves smooth cuneiform lanceolate truncate toothed at end, Calyxes reflexed
9371 Leaves smooth above hairy beneath cuneiform lanceolate truncate toothed at end
9372 Leaves pubescent cuneiform lanceolate blunt toothed at end, Calyx inflated downy
9373 Leaves velvety cuneiform linear blunt entire or 3-toothed at end, Cal campanulate
9374 Leaves velvety cuneiform lanceolate blunt upper entire, lower 3-5-toothed at end, Stipules lin. subul.
9375 Leaves velvety lanceolate blunt entire, Stipules linear subulate, Calyxes angular
9376 Leaves smooth rough at edge linear 3-cornered entire, Stipules large lanceolate
9377 Leaves white with down sess. cuneate obcord somew crenate at end, Stip obl blunt resembling lat lvs.
9378 Leaves smoothish oblong toothed pinnatifid lower ovate, upper elongate, Stem procumbent
9379 Leaves rough with scattered down linear-cuneiform coarsely toothed, Stipules linear entire
9380 Leaves roughish white bipinnatifid, Pedunc 2-flowered very long
9381 Leaves pinnatifid with linear lanceolate entire segments, Petals cut-toothed
9382 Leaves linear pinnatifid fleshy smoothish, Stem pubescent
9383 Leaves pinnatifid with linear entire acute lobes

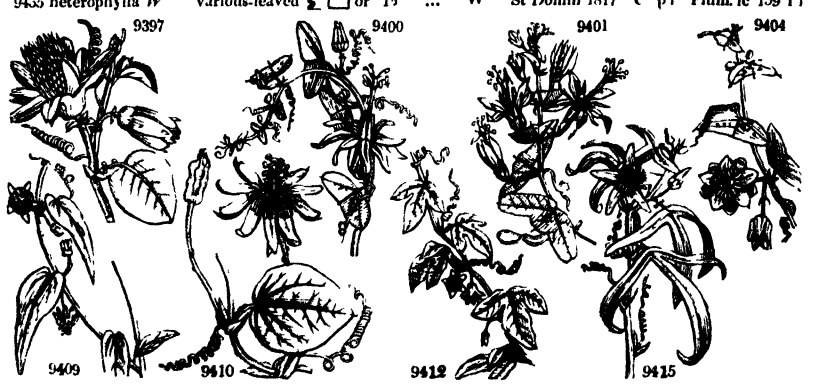
9384 Leaves ovate lanc toothed smooth, Pedunc 5-6-fl longer than petiole, Branches downy in decurrent lines
9385 Lvs uneq sided ovate obl acutely crenate plaited hoary on each side, Umbels 5-8-fl longer than petiole
9386 Leaves cordate crenate downy beneath, Fl capitate subsessile axillary and opposite the leaves
9387 Leaves ovate somewhat lobed serrated smooth, Flowers subterminal capitate sessile

9388 Leaves ovate cordate subpeltate acuminate crenulate beneath downy and reticulated
9389 Leaves cordate entire downy on each side

9390 Leaves cordate somewhat 3-lobed repand subtomentose
9391 Leaves cordate 5-angled somewhat lobed toothletted pubescent beneath

9392 Leaves ovate veiny subserrulate, Petioles with 2 glands, Invol 3-leaved
9393 Leaves elliptical entire blunt 3-nerved, Petioles without glands, Invol 0
9394 Leaves oblong ovate cordate 3-nerved veiny entire, Petioles with 2 glands, Invol 3-leaved larger than fl.
9395 Leaves 3-lobed peltate, Petioles with 4 glands, Flowers terminal racemose
9396 Leaves obl ovate subcord entire veiny, Petioles with 6 glands, Stipules roundish ovate, Invol 3-leaved

and Miscellaneous Particulars



cornered ligneous stems The flowers are red within, and white outside, they are odoriferous, and generally the plant is covered with fruits and flowers at the same time, which makes a fine appearance. The fruit, Sabine describes (*Hort Trans* iii 100) as very large, of an oblong shape, about six inches in diameter, from the stalk to the eye, and fifteen inches in circumference It is externally of a greenish-yellow when ripe, soft and leathery to the touch, and quite smooth, the rind is very thick, and contains a succulent pulp of a purple color (which is the edible part), mixed with the seeds in a sort of sack, from which it is readily separated Wine and sugar are commonly added to it when used The flavor is sweet and slightly acid, and it is very grateful to the taste, and cooling in a hot climate It has been successfully cultivated for its fruit in a few places, as at Lord Harewood's, Farnley Hall, &c (*Hort Trans* iv 60)

P hurifolia, the water lemon, *Pomme de Liane*, Fr, has a suffrutescent stem, with divaricating filiform branches, oval smooth leaves, and very long tendrils Flowers red and violet, sweet-scented, the fruit about the size of a hen's egg, but rather more elongated, and tapering equally at both ends, when ripe, it is yellow and dotted over with white spots, it contains a whitish watery pulp, which, in the West Indies, is usually sucked through a small hole made in the rind, the rind is tough, soft, and thin, the juice has a peculiar aromatic flavor, is delicately acid, and allays thirst agreeably It is grown in our stoves, but has not yet been cultivated for its fruit

P normalis has berries about the size of small grapes. The root has been extolled as a counterpoison and diuretic

P Murucuja produces fruit of an oblong oval form, about the size of a large olive, and flesh-colored when ripe Both the syrup and decoction of the plant are much used in the leeward parts of Jamaica, where it is frequent, and they are said to answer effectually all the purposes for which syrup of poppies and liquid laudanum are generally administered. The flowers are most in use they are commonly infused in, or pounded and

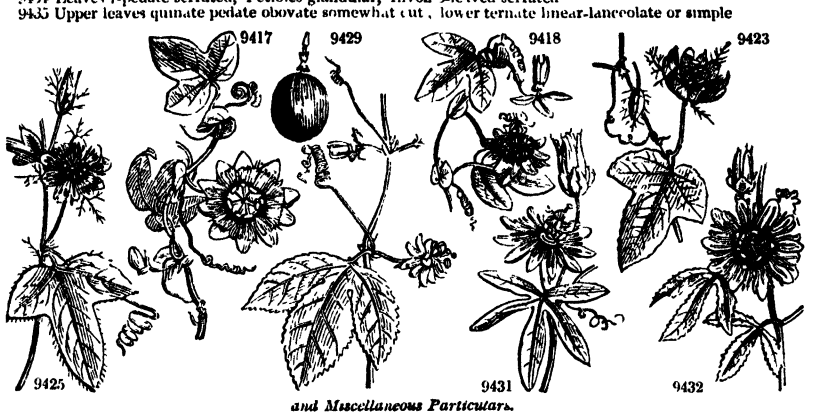
History, Use, Propagation, Culture,

mixed immediately with wine or spirits, and the composition is generally thought a very effectual and easy narcotic.

P incarnata, the May apple, has a perennial root, herbaceous shoots, and sweet-scented flowers, variegated with purple. The fruit is about the size of an apple, orange-colored, with a sweetish yellow pulp, but it requires the heat of the stove to bring it forward.

P cærulea is the tallest and most ligneous of the species. The stem will grow almost as large as a man's arm, and the shoots will often grow the length of fifteen feet in one summer. The leaves are the most elegant of the genus. The flowers are blue outside, and purple and white within: they have a faint scent, and continue but for one day. The fruit is egg-shaped, of the size and color of the Mogul plum, the yellow skin of which encloses a sweetish disagreeable pulp and black seeds.

Besides the species thus enumerated, some varieties have been procured by cross impregnation, which are very remarkable for their beauty, and for having acquired the hardihood of their parent. The most valuable of these artificial productions, is the P cæruleo racemosa, raised by Mr Milne, of Fulham, from seed of P racemosa impregnated by P cærulea, and figured in the Transactions of the Horticultural Society, vol. 3 tab. 3, and the P alato-cærulea, obtained by Mr J. H. Masters of Canterbury, between P alata of the West Indies, and P cærulea.



All the species grow and flower freely in a mixture of loam, and light rich earth or peat, with plenty of room. Most of them fruit in the stove, but the P cærulea seldom fruits in the greenhouse. They are all easily increased either by seeds or very young cuttings, in a close moist heat.

As fruit-bearing plants the Passifloras are thus treated:—"Having procured plants with good roots, plant such as are intended to fruit in a border in the stove, and train them to a trellis near the glass; they will in general produce fruit the second year. The seedlings of the P incarnata, will produce fruit the first year. All the species will fruit even in large pots, but Salme says, the "best method is to plant them in an angle of the bark-bed, which has been parted off, either by boards or brick-work, as low as the pit goes. At the bottom of

9397 Leaves obl. ovate subcord ent. veiny, Petioles with 4 glands, Stip lanc. falcate subserrate, Invol 3-leaved
9398 Leaves oblong entire veiny, Petioles with 2 glands, Invol 3-leaved toothed at end

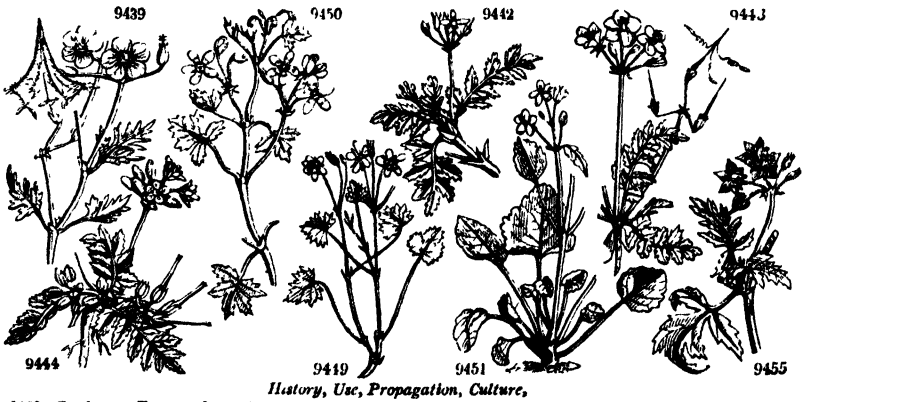
9408 Lvs. cord 3-lobed blunt smooth, Petioles without glands, Pedunc axill twin, Pet twice as narrow as cal
9409 Lower leaves 3 lobed acuminate, upper undivided lanceolate, Petioles with 2 glands, Flowers apetalous
9410 Leaves roundish cordate, Petioles with 2 glands, Flowers solitary long-stalked, Cal keeled, Stam 1-sided
9411 Leaves ovate entire 3-nerved veiny, Petioles with 2 glands, Flowers apetalous, Involucrum O
9412 Lvs 3-lobed smooth, Lobes lanc, middle one longest, Petioles with 2 glands, Fl apetal Stem corky at base
9413 Leaves subcordate 3-lobed, Lobes rounded with 2 glands, Pedunc axillary solitary, Flower apetalous
9414 Lvs 3-lobed smooth, Lobes oblong, lat very short, Petioles with 2 glands, Fl apetal Stem corky at base
9415 Lvs peltate deeply 3-lobed smooth, Lobes lin lanc divaricating, Petioles with 2 glands, Flow apetalous
9416 Leaves peltate half 3 lobed smooth, Lobes ovate blunt, Petioles with 2 glands, Fl apetalous
9417 Leaves peltate cordate 3-lobed, Lobes equal oblong blunt, Petioles with 4 glands, Petals length of calyx

9418 Leaves discolored peltate
9419 Leaves 3-lobed downy with a reflexed tooth on each side at the base
9420 Leaves 3-lobed vill, lower smooth above, Lobes obl entire, intermediate longest, Petioles with 2 glands
9421 Leaves 2-lobed glandular beneath, Lobes oblong erect, Peduncles twin
9422 Leaves palmate about 5-parted subserrulate, Involucre 3-leaved entire, Rays a little shorter than corolla
9423 Leaves 3-lobed cordate hairy, Involucres multifid capillary
9424 Leaves and stems all fringed with red hairs
9425 Leaves 3-lobed cordate smooth cili ted serrated, Involucres multifid capillary
9426 Downy, Leaves cord ate 3-lobed, Peduncles twice as short as petiole, Corona much shorter than corolla
9427 Lvs rounded trun at base slightly 3-5-lobed, Lobes blunt, Petioles without glands, Pet shorter than cal.
9428 Stem square, Leaves 3-lobed lobes nearly equal serrated, Pedunc long 1-flowered
9429 Leaves 3-lobed serrated smooth, Invol glandular serrulate caducous, Ovary naked
9430 Lvs 3-lobed serr Lobes obl acute, Petioles with 2 glands, Inv 3-leaved, Threads of corona longer than cor.
9431 Lvs palmate 5-parted entire, Petioles gland Invol 3-leaved entire, Threads of corona shorter than corolla

9432 Leaves palmate 5-parted serr Petioles gland Invol 3-leaved serrate, Threads of corona longer than cor.
9433 Leaves palmate 7-parted serrated, Petioles glandular, Invol 3-fid entire
9434 Leaves 7-pedate serrated, Petioles glandular, Invol 3-leaved serrated
9435 Upper leaves quinate pedate obovate somewhat cut, lower ternate linear-lanceolate or simple



and Miscellaneous Particulars.

the cavity formed by this division, should be laid some brick-rubbish, over which may be thrown a little dead tan, and the whole be then filled with equal parts of very old tan, and a compost of leaf-mould and rotten dung Herein the roots will strike freely, and will even spread through the partition into the pit, growing into the fresh tan Such roots may be trimmed and reduced whenever the tan is changed, but should the plant have been some time in its station, it will be as well to leave part of the old tan in the bottom of the pit, in which the protruded roots may remain undisturbed They do not require the full heat of the pine stove, for they flourish best in a temperature of from sixty-five to seventy degrees, but they do not bring their fruit to perfection if kept in a common greenhouse or conservatory, though they will grow and flower in it. The shoots, as they advance, must be trained near to and under the inclined glass of the stove the flowers will appear in May, and the blooming will continue until September, the fruit setting the whole time, but if it does not set well, it will be advisable to impregnate the stigmas by applying the pollen with a feather As they grow, the very strong shoots should be cut out from their origin, for these do not bear fruit so abundantly as those which are less vigorous, but the fruiting branches must not be shortened on any account. The temperature must be kept up equally during the time of flowering and fruiting. The crop will begin to come in in August, and will continue until January, but the earlier produce is the best. When the crop is all off, which will be early in January, the heat must be reduced to about fifty degrees, so as to check or stop the growth, this being effected, the shoots must be well cut in As little old wood as possible, besides the main stem, which rises from the pit to the glass, and a few pieces (about two or three feet of each of the old branches should be retained, for all that is to be trained under the glass to bear in each year, ought to be the growth of the same season It is found that the shoots break better, and in greater quantity, from the older wood than from that of two years' standing. In this dormant and reduced state it is to be kept during January and February, after which the necessary heat may be applied to cause it to resume its functions for the ensuing season." History, Use, Propagation, Culture,

1460 *Erodium* From ἠρώδιος, a heron, because the fruit resembles the head and breast of that bird. The species are hardy plants, of common treatment, and no great beauty

1461 *Pelargonium* So called from πελαργος, a stork, in allusion to the beak of the fruit, which resembles the bill of that bird, as well as to preserve an analogy with the Geranium or Crane's-bill It was detached by the late learned botanist Mons L'Heritier, along with Erodium, from the Linnean genus Geranium, and distinguished by its seven fertile stamens, irregular flower, tubular nectary, and spiral-leaved awns, or beaks to the capsule

"This vast and favorite genus, for which we are almost entirely indebted to the Cape of Good Hope, consists of a number of well marked species. But that number is greatly augmented in almost every book, by the admission of spurious hybrid species or varieties, which continually start up from seed, wherever many of the primary ones are cultivated, and are for a while propagated by cuttings, and even by seed Sooner or later,

and Miscellaneous Particulars

however, they for the most part vanish, even before the eyes of those who witnessed their origin" (*Smith*)

The greater part of the species being of the easiest cultivation, and many bearing the confined air of a sitting room better than most plants, it has happened that they have become objects of universal cultivation and attention, of which, indeed, they are in many cases deserving, for their neatness and beauty alone There is, however, an uniformity in their form, coloring, and foliage, for which the liveliest colors will scarcely compensate The popular taste for the Pelargonium tribe, or for Geraniums, as they are commonly called, has been much aided by several splendid publications both in this country and abroad, and especially by the Geraniaceæ of Mr Sweet, in which it is proposed to figure not only all the species formed by the hand of nature, but the multitudes of hybrid creations produced by the assistance of modern ingenuity It is very doubtful whether any permanent advantage is derived from the obtaining such of these productions as are truly

History, Use, Propagation, Culture,

hybrid, but it is quite certain, that to admit them into works of science, is replete with the greatest inconvenience, and can lead to no useful end In the arrangement here adopted, all those kinds which are manifestly or avowedly artificial productions, are therefore placed at the end of the legitimate species in alphabetical order, an order much more commensurate with their importance, than an arrangement upon scientific principles

**** Leaves pinnatifid. Segments cut or multifid*

9477 Stemless, Leaves hairy bipinnated, Lobes linear somewhat blunt, Upper petals reflexed · lower connivent
9478 Nearly stemless, Lvs. bipinnated hairy, Lobes pinnati. cut multifid linear somewhat toothed, Fl. nodding
9479 Stemless, Lvs hairy pinnated : segm pinnatifid or trifid, Lobes linear acute
9480 Stemless, Lvs. pinnated · segm trifid, Lobes linear acum bearded at end, Pet lin blunt
9481 Stemless, Lvs pinnated : segm trifid cut at end naked, Pet. blunt all with an oblong spot
9482 Stemless, Lvs pinnated pubesc : segm. cuneate 3-5-toothed at end, Teeth setose at end, Umb. compound
9483 Stemless, Lvs pinnated smooth segm. cut-lobed acute, Umb simple, Petals emarginate
9484 Subcaulescent, Leaves pinnated or 3-cut segm obl lanc smooth entire ciliated at edge acum at end
9485 Stemless, Lvs pinnated. segments bipartite, Umbel compound
9486 Stemless, Lvs pinnated hairy : segm cut multifid, Umbel simple 4-6-fl. Petals linear
9487 Stemless, Lvs pinnated segm lanc linear, Umbel compound
9488 Stemless, Lvs lanc linear entire and pinnatifid, Umb compound
9489 Stemless, Lvs hairy ciliated obovate or lanc. entire or pinnatifid, Stipules adhering to petiole
9490 Nearly stemless, Lvs hairy pinnated · segm. oval-obl blunt subpinnatifid or toothed, Petals lin blunt
9491 Stemless, Lvs hispid entire or 3 cut, Umbel compound, Flowers dioecious [at end
9492 Stemless, Lvs. downy : some obl. and entire, others pinnated, Upper sepal erect, Barren filam. incurved

§ 2 DIMACRIA Lindl *Petals 5 unequal, two upper connivent spreading at end Stamens shorter than sepals, 5 fertile, two lowermost twice as long as the rest, upper very short, 5 sterile, very small, nearly equal Stemless herbs, with a tuberous turnip-like root, leaves stalked pinnatifid*

** Leaves pinnated, with an odd segment. Segments entire*

9493 Stemless, Lvs pinnated villous segm ovate in 2 or 4 pairs, Petals nearly entire flat
9494 Stemless, Lvs pinnated hairy segm elliptical in many pairs, Petals wavy twisted at base
9495 Stemless, Lvs pinnated smooth. segm of 1 or 2 pairs obovate or oblong
9496 Stemless, Lvs pinnated smooth segm of 2 or 3 pair obovate the terminal ones confluent

*** Leaves pinnate, with an odd one. Segments lobed or multifid*

9497 Nearly stemless, Leaves smooth pinnated · segments lobed blunt, Upper petals obcordate
9498 Stemless, Lvs smooth bipinnated, Lobes trifid linear blunt, Scape simple

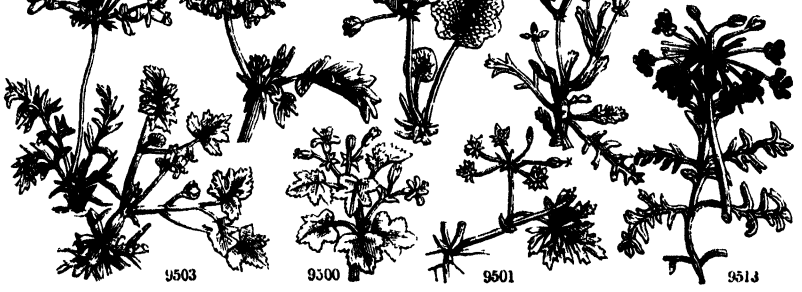
§ 3 CINOSBATA Dec *Petals oval, nearly equal, almost twice as long as calyx Stamens 10 erect, the 5 alternate ones bearing the anthers Stems shrubby, erect*

9499 Stem shrubby at base, Lvs cordate 5-lobed hairy zoned, Lobes acutely toothed at end
9500 Stem shrubby branched, Lvs cordate 3-lobed toothed hairy middle lobe 3-lobed, Pedunc 2-floweerd

§ 4 PERISTERA. Dec. *Petals nearly equal, as long as calyx, or a little larger Stamens 10, 5 longer, nearly equal, or one only occasionally abortive, 5 alternate, very short, sterile, tooth like Herbs with stems, and with the appearance of Erodium or Geranium*

9501 Stems many diffuse, Lvs cordate roundish many-parted, Lobes trifid, Lobelets linear blunt
9502 Caulescent procumbent, Lvs cord somewhat lobed crenate-toothed, Pedunc 2-flowered
9503 Stems many procumbent, Lvs cord. usually 3-parted or 5-lobed toothed, Pedunc 3-5-flowered
9504 Much branched procumbent, Leaves ellipt blunt hoary toothed, Pedunc 2-flowered, Anthers 5
9505 Diffuse procumbent, Lvs cordate somewhat lobed villous beneath, Peduncles many-flowered
9506 Diffuse procumbent, Lvs cordate ovate villous 3-lobed toothed upper sinuated, Umbel many-flowered

§ 5 OTIDIA Lindl. *Petals oblong-linear, nearly equal, about twice as long as calyx, the two upper auricled at the base on the upper side Stamens 10, erect, 5 fertile, 2 upper spatulate or subulate, 3 lower shorter Stems shrubby, fleshy Leaves alternate pinnated, fleshy Flowers whitish*

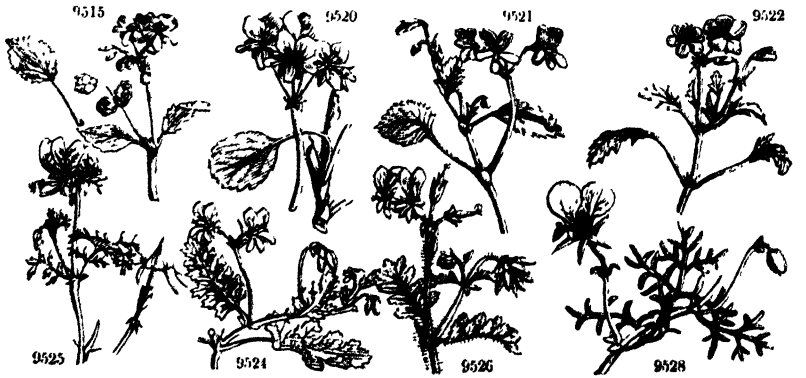


9507 Stem shrubby fleshy, Umb many-flowered loosely panicled, Lvs pinnated smooth, Petals somew toothed
9508 Stem shrubby fleshy branched, Lvs fleshy pinnated lobes lin round channelled entire or 3-toothed at end
9509 Stem shrubby fleshy warted, Lvs fleshy pinnated segm cut pinnatifid subtrifid at end [at base
9510 Stem shrubby fleshy, Lvs fleshy bipinnated lobes dilated and cut at end, Pedunc panicl Upper pet crisp
9511 Stem shrubby fleshy, Branches hairy, Lvs pinnat segm stalked subalternate wedge-shaped toothed at end
9512 Stem fleshy thick suffruticose at base, Lvs smooth thick sinuate-pinnat segm obl blunt cut toothed at end

§ 6. POLYACTIUM Dec *Sepals nearly equal, revolute Petals 5, nearly equal, obovate Stamens 10, 5 fertile the four lower long, subulate, upper broad, spatulate, reflexed at end, the fertile ones shorter, incurved at end Petals with a very large dark brown spot which is scarcely edged with yellow*

9513 Subcaulesc Lower lvs pinnat hairy segm pinnati, lobes obl blunt cut-toothed, upper smoothish bipinn

§ 7 ISOPETALUM Sweet *Upper sepal ending in a honey pore and not in a tube Petals 5, equal Stamens 10, united in a very short cup, 5-6 fertile, spreading incurved at end, sterile unequal, subulate incurved Shrub with a fleshy stem.*



9514 Stem thick fleshy branched naked, Lvs cord subpeltate rugose pubesc netted with downy veins beneath

and Miscellaneous Particulars

The bulbous or fleshy stemmed species are generally very rare in collections, and are far more interesting than the common or vulgar kinds They are distinguished by so peculiar a habit and constitution, that there can be little doubt of the propriety of separating them into one or more distinct genera, as has been done already by the authors quoted above, especially as the characters upon which they are founded, are generally more certain than those by which Erodium and Geranium are defined. Here, however, they are placed as

History, Use, Propagation, Culture,

sectional names, so as to present a double arrangement, in which the purposes of combination and analysis are both combined.

As the cultivation of Pelargonium generally is of the easiest kind, so is that of the bulbous rooted species of the most difficult nature. They require plenty of air and light, not to be over-watered, and a great deal of

§ 8. CAMPYLIA Lindl. *Petals 5, unequal, two upper larger, with an auricled claw. Stamens* 10, *hairy or pubescent, 5 fertile, erect, 5 alternate sterile, of which the two upper are longer and hooked back Herbs at the base a little shrubby, branched Leaves stalked, ovate or oblong, toothed or cut*

* *Petals with an appendage to the claw · 5 stamens fertile, erect ; 5 sterile, of which the two uppermost are hooked backwards* TRUE CAMPYLIA

9515 Stem suffruticose erect, Lvs ovate round blunt hoary silky toothed, Upper petals roundish · lower oblong
9516 Stem suffruticose erect, Lvs ellipt roundish blunt crenate silky, Upper pet obovate sharply emarginate
9517 Stem suffruticose erect, Lvs roundish ovate blunt doubly toothed silky, Upper petals round dark purple
9518 Stem herbaceous ascending, Lvs obl lanc blunt toothed hoary, Pedunc 1-3-fl Upper petals obovate
9519 Stem suffruticose ascending, Lvs lin lanc cut-toothed at end hoary beneath, Upper petals obov oblong
9520 Stem suffruticose, Lvs ovate plaited serrated downy, 3 upper petals very broad ovate
9521 Stem suffruticose ascending, Lvs ovate unequally toothed or cut, Stipules carinate, Upper pet oval wavy

** *Upper petals warted above the claw Tube of stamens very short, 5 fertile recurved, spreading, 5 sterile straight* PHYMALANTHUS Lindl

9522 Stem suffruticose erect, Lvs lanc villous cut-toothed trifid, Upper petals blistered at base

§ 9. MYRRHIDIUM Dec *Petals 4, or rarely 5, the two upper very large, obovate, cuneate, usually marked with branching lines, the two or three lower much smaller, oblong-linear Stamens* 10, *with their tube and filaments straight, generally with 5 anthers, and 5 alternately barren, rarely 7 fertile Biennial or perennial herbs rarely shrubby Stems round Leaves pinnate or ternate, often multifid.*

* *Anthers 5 Petals 4*

9523 Stem suffruticose, Lvs 3-parted, Lobes toothed at end blunt · lower obovate, middle ovate often trifid
9524 Stem herbaceous strigose ascending, Lvs hispid on each side rigid pinnated, Lobes cut-toothed
9525 Stem herbaceous biennial somewhat downy, Lvs bipinnate smooth, Lobes linear subpinnatifid

** *Anthers 5 Petals 5*

9526 Stem herbaceous hairy suberect, Lvs bipinnatifid, Segm. lanc blunt toothed at end

*** *Anthers 7 Petals 4*

9527 Stem herbaceous biennial hairy erect, Lvs pinnated hairy beneath smooth above, Lobes toothed
9528 Stem herbaceous hairy, Lvs bipinnate, Lobes linear smoothish, Pedunc. 1-fl
9529 Stem herbaceous procumbent smooth, Lvs subbipinnatifid toothed, Pedunc many-fl capitate

§ 10 SEYMOURIA Sweet *Petals 2, distinct at base, abruptly reflexed in the middle Stamens 5, nearly equal, in a long straight tube, all fertile*

9530 Lvs. roundish cordate bluntish entire ciliated shining on the upper side
9431 Leaves ovate entire acute smooth, Umb simple, Flowers pentandrous

§ 11 JENKINSONIA Sweet *Petals 5, the two upper much larger than the rest, emarginate at end, striated with colored lines, the 3 lower much smaller Stamens 10, ascending, spreading at end, hairy at base, 7 fertile, of which the three upper are shorter, the three sterile shortened, subulate, of equal length. Stems shrubby Flowers large*

9532 Lvs bipinnatifid hairy, Stem procumb hairy, Flowers heptandrous Petals 4
9533 Stem shrubby flexuose, Lvs pubescent palmate 5-fid, Lobes cuneate 3-toothed at end

§ 12 CHORISMA, Lindl *Petals 4, rarely 5, the two upper with long claws largest, two lower much smaller Stamens declinate, in a very long tube, jointed in middle, connate, 7 fertile, of which the two lower are loose, the 3 sterile shortened, subulate of equal length*

9534 Branches 4-cornered fleshy, Leaves cordate bluntly lobed somewhat toothed

§ 13 PELARGONIUM. Lindl *Petals 5, unequal, the two upper approximating Stamens* 10, *unequal, 7 fertile, 3 sterile, subulate*

* *Petals whole colored, the two upper shorter and narrower Stamens short, erect, the two lowest very short with nearly sessile anthers Stem shrubby, fleshy* CRONIUM, Sweet

9535 Leaves very smooth obovate crenate somewhat fleshy, Pedunc few-fl Petals linear
9536 Leaves roundish obsoletely lobed crenate smooth zoned, Petals linear breadth of sepals
9537 Leaves roundish obseletely lobed crenate younger somewhat zoned, Pedunc 4-fl Petals linear
9538 Leaves roundish obsoletely lobed crenate downy zoned, Petals linear narrower than sepals
9539 Leaves roundish obsoletely lobed crenate smooth not spotted, Petals linear cuneiform
9540 Leaves cordate-orbicular obsoletely lobed toothed zoned upwards, Pedunc many-fl Petals cuneate

9541 Leaves reniform 5-lobed crenate zoned, Stipules cordate obl acute ciliated, Umbels many-fl crowded
9542 Leaves round reniform scarcely divided crenate viscid, Petals obovate cuneate
9543 Leaves cordate orbicular cut-lobed toothed pubescent on each side, Petals obl cuneate
9544 Leaves roundish reniform obsoletely lobed somewhat zoned complicate crisp downy on each side

** *Petals nearly equal in size*

§ A *Stems herbaceous Leaves cordate, palmate, lobed Petals small*

9545 Stem diffuse, Lvs cord ov obsoletely lobed bluntly toothed ciliated Pet equal to the cal and one another

and Miscellaneous Particulars.

attention at all periods. If well managed, they flower beautifully, and are incomparably superior in all points to the commoner races. They are no where in this country managed with so much success as by Sweet, who seems to hold the reins of nature in his hands in a more steady manner than any cultivator of the age.

History, Use, Propagation, Culture,

The most common free-growing kinds will thrive well in any rich light soil, or a mixture of loam and decayed leaves will suit them very well the dwarfer woody kinds, as P tricolor, elegans, Blattarium, ovale,

9546 Stem diffuse, Lvs. cord somewhat lobed bluntly crenate villous beneath, Pet. larger than calyx

9547 Stem fleshy very short, Branches herbaceous long diffuse, Lvs roundish cordate very soft
9548 Branches spreading soft with down, Lvs roundish cordate about 3-lobed bluntly toothed very soft
9549 Stems square very smooth, Lvs cordate roundish cut toothed, Pedunc. about 2-fl.
9550 Stems 3-cornered 2-edged smooth, Lvs cordate roundish obsoletely lobed toothed, Umb many-fl.
9551 Stem hispid, Lvs reniform 3-5-lobed blunt toothed at end smoothish, Pedunc. long 2-4-fl.
9552 Stem villous, Lvs cordate 5-lobed palmate villous, Pedunc few-fl Stigma sessile
9553 Stem erect, Lvs. bipinnatifid laciniate smooth, Involucres and calyxes blunt

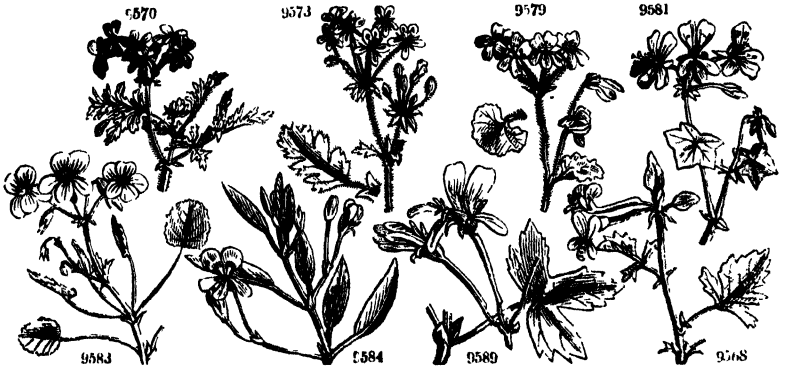
§ B *Stem half shrubby. Leaves pinnate. Lobes multifid*
9554 Leaves cinereous velvety palmately 3-cut, Lobes linear trifid, Calyxes somewhat hispid
9555 Leaves 3-cut dark-green, Lobes distant 3-parted laciniated, Petals linear flaccid
9556 Stem fleshy naked erect, Leaves hairy bipinnate decompound, Lobes linear subulate
9557 Leaves 3-parted fleshy cut-toothed glaucous, Segments subsessile cuneiform, Honey spur very long
9558 Leaves cuneiform trifid toothed, Petioles and stipules persistent spiny, Umb comp few-fl

§ C *Stem half-shrubby, fleshy Leaves trifid or pinnate, fleshy, Petals yellowish brown.*
9559 Stem with tumid articulations, Leaves pinnate of 1 or 2 pairs with an odd one blunt cuneate cut-toothed

§ D. *Nearly stemless Root fascicled, tuberous Leaves decompound, laciniated Petals yellowish brown.*
9560 Leaves decompound laciniate hairy, Segm linear, Umb many-fl
9561 Leaves hairy pinnate, Segm bipinnate, divisions ovate toothed somewhat acute
9562 Leaves smooth ciliated fleshy 5-7-lobed toothed reflexed at end, Umb many-flow Fls on very long stalks
9563 Leaves hairy pinnate, Segm bipinnatifid, divisions linear acute
9564 Leaves ternate oblong blunt wavy hairy on each side and revolute at end, Petals 2-parted multifid
9565 Leaves cordate downy beneath bluntly 3-5-lobed sinuate-toothed, Scape divided
9566 Leaves decompound smooth, Leaflets cut, Segments channelled linear, Calyx reflexed

§ E. *Stem short, or somewhat fleshy Leaves divided, cut or toothed Petals scarlet or crimson.*
9567 Leaves hairy pinnated, Segments laciniate pinnatifid decurrent, Lobes linear lanceolate
9568 Leaves 3-parted, Segm sessile cuneate cut toothed, Middle lobe larger pinnatifid
9569 Leaves cord. 3-lobed, Segm toothed lateral bifid, middle 3-lobed, Stipules cord. acum somew toothed

§ F *Stem half shrubby Leaves lobed, hairy Petals with a broad purple spot in the middle.*
9570 Leaves hispid 3-parted, Segm multifid, Lobes linear-lanceolate serrated
9571 Leaves cordate 3-fid wavy hairy blunt toothed lateral segments 3-lobed, upper 5-lobed

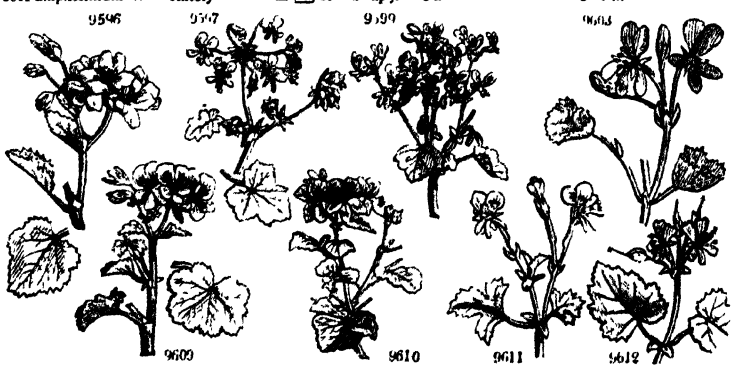


§ G. *Stem fleshy, half shrubby Leaves oblong, or oftener cordate, somewhat cut Stipules lanceolate, spreading, acute Roots tuberous, fascicled*
9572 Leaves 3-parted hairy, Lateral segments smaller lobed toothed, term long cut-toothed, Pet spreading
9573 Leaves oblong lobed pinnatifid, Petioles united at base, Umb many-flowered
9574 Leaves cord obl subruncinate toothed downy, Scape branched, Umb many-fl Involucre leafy
9575 Leaves ovate cordate somewhat lobed crenate villous beneath, Stipules persistent spiny
9576 Leaves reniform obacuminate toothed silky on each side, Bractes 4 times shorter than pedicel
9577 Leaves reniform obacuminate toothed silky on each side, Bractes twice as short as peduncels
9578 Leaves cordate cut-lobed wavy bluntly toothed downy, Honey-tube 4 times as long as calyx
9579 Leaves reniform crenate-toothed downy beneath, Stipules persistent dilated at base

§ H *Stem shrubby, fleshy Leaves peltate, or cordate 5-lobed, fleshy Honey-tube as long as stalk Stipules broad ovate*
9580 Branches fleshy round, Leaves cordate 5-lobed somewhat toothed fleshy smooth, Umb many-fl.
9581 Branches fleshy angular, Leaves peltate 5-lobed entire fleshy, Umb few-fl

**** Two upper petals broader, shorter, very blunt*
9582 Stem weak prostrate, Branches petioles and peduncles softly hairy, Leaves oval acute toothed hairy
9583 Leaves elliptical roundish finely serrate blunt rigid smooth, Petals all obovate

***** Two upper petals longer and broader Stems shrubby*
§ A *Leaves smooth, or nearly smooth, more or less glaucous*
1. *Petals white, the upper generally lined with red, or spotted.*
9584 Very smooth and glaucous, Leaves lanceolate entire acuminate, Peduncles 1-2-fl
9585 Smooth glaucous, Leaves lanceolate entire or 3-parted, lower toothed, Pedunc about 1-fl panicled
9586 Very smooth somewhat glaucous, Leaves ovate acute glaucous somewhat cut remotely serrate
9587 Very smooth, Leaves deeply 3-parted, Segm. acinaciform cut serrate, Peduncles 3-flowered
9588 Very smooth glaucous, Leaves 3-parted, Segm trifid cuneate, divisions linear lanc Pedunc about 2-fl
9589 Smooth glauc Lvs 5-lobed palmati cord at base, Lobes toothed tow the end, Pet 3 times as long as cal
9590 Smooth glaucous, Leaves 3-5-lobed palmate-parted, Segments trifid toothed, Stipules ovate cordate acute



2 *Petals rosy or violet, upper generally striped with purple*
9591 Smooth glaucous, Leaves long-stalked cordate reniform 5-fid toothed, Petals lanceolate-cuneate
9592 Smooth glaucous, Leaves on long stalks cordate roundish 5-fid toothed zoned above
9593 Smooth glaucous, Leaves cord. 5-lobed toothed glaucous beneath younger zoned above, upper 5-parted

and Miscellaneous Particulars.

&c thrive best in an equal mixture of sandy loam and peat, and require their pots to be well drained the succulent kinds like a light sandy loam, and require scarcely any water when not in vigorous growth the

History, Use, Propagation, Culture.

tuberous rooted kinds thrive best in very sandy loam and peat, and require no water after they have flowered, till they begin to grow afresh. Cuttings of the shrubby kinds strike root freely under hand-glasses in the same

§ B. *Flowers white, or scarcely rose-colored; two upper petals deep-red, lined. Leaves ovate, cordate, or reniform toothed, undivided.*

9594 Lvs. ovate cut serr. the younger scabrous backwards, adult nearly smooth, Stipules ovate acuminate
9595 Leaves ovate unequally serrate smoothish, Stipules ovate-lanceolate, Peduncles 2-4-flowered
9596 Umb. many-fl. Leaves ovate acute concave rigid somew. lobed uneq tooth. truncate at base many-nerved

§ C. *Petals white, narrow Leaves cordate, soft with down. Stipules spreading much.*

9597 Stem shrubby fleshy, Branches peduncles and leaves hirsute, Leaves cordate hastate 5-lobed very soft
9598 Stem shrubby fleshy, Branches and pedunc. subhirsute, Lvs cord hastate 5-lobed rough, Umb. many-fl.

§ D *Leaves cordate, flat, toothed Lower petals linear, upper purple, lined*

9599 Branches leaves and peduncs hairy, Leaves cordate roundish angular toothed, Umbels panicled many-fl.
9600 Lvs cord. acute toothed flat hoary beneath and downy, Branches and peduncles villose, Lower petals subulate-lin
9601 Leaves cordate acutely crenulate quite smooth, Stipules linear reflexed, Umbels many-flowered
9602 Leaves roundish ovate truncate subcordate at base cut-toothed wavy beneath hoary pubescent

§ E. *Leaves cordate, or cuneate, toothed, undivided, or lobed Lobes blunt, not divided down to the middle. Flowers purple. Lower petals oblong or obovate*

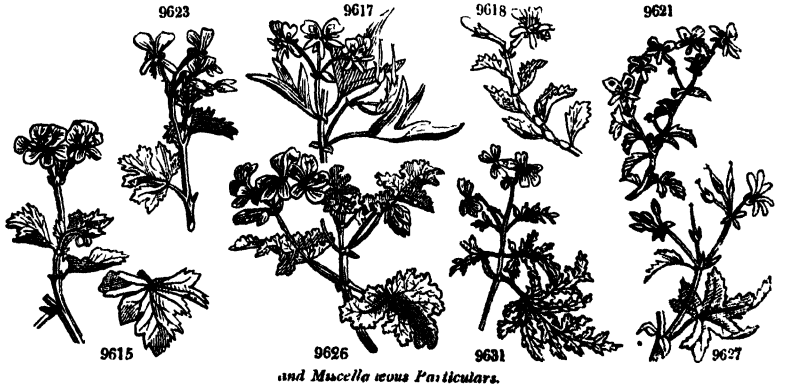
1 *Leaves undivided, cucullate*

9603 Leaves reniform cucullate toothed pubescent, Branches and peduncles softly hispid, Lower petals oblong
9604 Leaves roundish truncate reniform with acute cartilaginous teeth many-nerved subpubescent
9605 Leaves roundish ovate subcord concave somewhat angular serr pubesc Honey-tube the length of calyx
9606 Leaves cun at base entire at end palmately 5-lobed toothed many-nerved rather villous, Stip cordate ovate
9607 Leaves truncate at base subcucul roundish bluntly 5-lobed toothed pubesc Stipules cord ovate acuminate
9608 Leaves reniform blunt cucullate toothletted hairy on each side, Umbels many-flowered
9609 Leaves cord. roundish somewhat lobed tooth-crenate wavy at edge, Stipules cord acute somew toothed

2 *Leaves lobed, flattish*

9610 Leaves cordate bluntly 3-lobed wavy villous soft, Pedunc about 2-flowered
9611 Leaves truncate at base subcuneate 3-fid flat hairy, Lobes divaricating serrated at end, Lower petals lin
9612 Leaves cordate 3-lobed roughish blunt toothed, Stipules broad cordate, Stem erect
9613 Leaves cordate lobed wavy softly villous toothed, Stipules broad cordate, Stems diffuse
9614 Lvs subcord. acute slightly 5-lobed serrated, Umb 5-fl subcapitate, Ped scarcely longer than involucrum

3 *Leaves lobed Lobes acutely cut at end*



9615 Lvs. deeply 3-lobed, Lobes round blunt unequally toothlett. Veins beneath and calyx roughish, Stipules cord
9616 Leaves cuneate at base trifid, Lobes acute middle longer subserrate with a midrib muricated beneath
9617 Leaves cuneate at base trifid rough, Lobes lanc loosely serrated, Pedun 1-4-flowered
9618 Leaves cuneiform distichous rough plaited truncate at end cut-toothed, Peduncles 2-flowered short
9619 Leaves distichous roundish fleshy subcuneate at base trifid wavy plaited rough toothed, Pedun about 2-fl
9620 Leaves truncate cord 3-lobed toothed hoary, Stipules scarcely any, Peduncles 3-4-flowered
9621 Lower lvs deeply 3-lobed beneath pustular, Lateral lobes spreading unequally and acutely toothed
9622 Leaves deeply 3-lobed, Lobes spreading unequally and acutely toothed at end beneath and at edge rough
9623 Leaves 3-parted cucullate rough, Lobes cuneiform cut-serrate at end the middle one trifid

§ F *Leaves divided beyond the middle Lobes toothed, cut, or pinnatifid Flowers purplish or pale*

9624 Leaves cord pinnatifid with rounded recesses, Lobes blunt crenate, Branches and petioles hispid
9625 Leaves palmately 7-lobed, Lobes oblong blunt toothed revolute at edge, Umb many-fl capitate
9626 Leaves cord hastate 5-angled toothed viscid smoothish, Umb 2-4-fl Honey tube a little longer than calyx
9627 Leaves palmatifid downy hispid, Lobes acuminate cut toothed, Umb panicled many-fl
9628 Leaves palmated rough, Lobes narrow pinnatifid revolute at edge, Segm linear, Umb few-fl
9629 Leaves palmated roughish cuneate at base, Lobes lanc remotely toothed, Umb few-fl
9630 Leaves somewhat palmated rough, Lobes 5-7-oblong blunt crisply toothletted at edge, Umb 5-fl in heads
9631 Leaves palmated viscid smooth, Lobes linear pinnatifid repand toothed flattish, Umb few-fl
9632 Leaves rough palmate 5-lobed, Lobes oblong serrated middle 3-lobed, Umbels few-fl compound

‡ *Uncertain species*

9633 Stem fleshy branched arboreous, Lvs. cord peltate pubesc variably glauc Petioles villous without stipules
9634 Leaves reniform distichous slightly 3-lobed blunt unequally toothed wavy
9635 Leaves slightly trifid unequally and acutely toothed wavy hairy, Peduncles 2-4-fl
9636 Leaves roundish ovate blunt subtrifid folded together wavy toothed hairy beneath, Sepals erect
9637 Leaves slightly 3-lobed flat blunt, Lobes divaricating unequally and finely toothed, Pedunc. 3-fl
9638 Leaves roundish cuneate slightly 3-lobed wavy toothletted, Branches petioles and peduncles villous
9639 Leaves roundish cuneate slightly 3-lobed wavy toothletted, Honey tube twice as short as reflexed calyx
9640 Leaves ellipt blunt floral obsoletely subtrifid unequally toothed somew cuneate and entire at the base
9641 Leaves flat very smooth half round 7-lobed serrated slightly cordate at base, Pedunc 2-5-flowered

and Miscellaneous Particulars.

kind of soil, or in pots, without being covered by glass, and placed in a shady situation. Many of the kinds may also be increased by pieces of their roots, or from seeds. The tuberous-rooted kinds may be propagated

History, Use, Propagation, Culture

interest, and in others, being extremely shewy border-flowers The G Lancastriense is the most elegant, and G. sanguineum the most ornamental of our British kinds G. anemonifolium, a Cape species, is singularly beautiful, on account of its fine caulescent stem, loaded with large fern-like glossy leaves of the most delicate green, and its fine red rich blossoms broader than half a crown

1464. *Brownea.* Named after Dr Patrick Browne, an English physician, who published a Natural History of Jamaica, in 1756, illustrated with figures from the pencil of Ehret A splendid genus, as yet rare in British gardens. Loamy soil best suits rooted plants, and ripened cuttings root in sand in close moist heat.

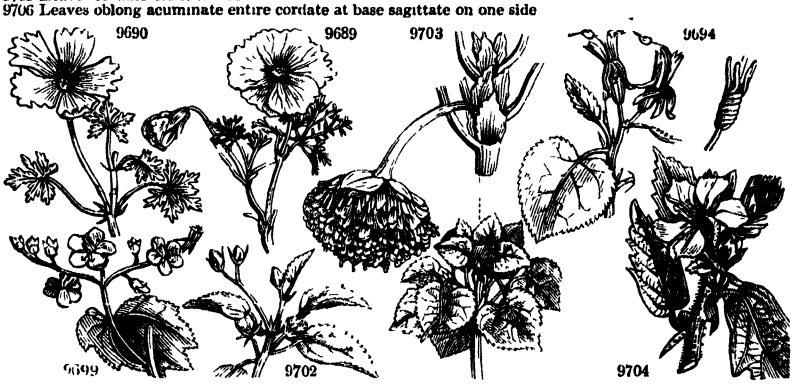
1465. *Monsonia* In memory of Lady Ann Monson, a lady of eminent botanical acquirements, who resided for many years in the East Indies, and is said to have assisted in compiling Lee's Introduction to Botany. The species are curious and beautiful plants: they grow well in turfy loam and rotten leaves, and are increased by cuttings of the shoots or roots.

9666 Stem somew angul. erect dichotomous pubesc backw Lvs 3-5-part cut-toothed: radic on very long stalks
9667 Stem angular diffuse pubesc backw Lvs palmate 5-part · lobes 3-lobed cut serrate, Ped and cal vill viscid
9668 Stem decumbent villous with spreading hairs, Leaves 5-7-lobed lobes cut-toothed, Ped very long hairy
9669 Stem ascending smoothish, Leaves peltate 7-parted lobes cut, Peduncles and calyx villous
9670 Stem naked at base erect smooth, Caul lvs opposite 3-5 part lobes cut acute, Ped 3 times as long as leaf
9671 Stems decumbent branched, Petioles and peduncles hispid, Leaves 3-5-parted lobes linear blunt trifid
9672 Stems decumbent, Petioles pedunc and calyx smoothish, Caul lvs. opp 3-5-parted: lobes trifid toothed
9673 Stem prostrate compressed, Lvs opp 5-lobed · lobes oblong unequally toothed, Ped elong and cal hairy
9674 Stem erect branched, Leaves reniform 7-lobed. segm. oblong obtuse trifid, lobes 3-toothed
9675 Stem more flaccid and nearly naked, Grains nearly smooth Otherwise like the last
9676 Leaves ren. rad 9-lobed, caul 7-lobed lobes 3-fid, Pet. bifid length of pointless cal Fruit smooth rugose
9677 Leaves subreniform 7-lobed lobes 3-fid, Petals emarg. length of pointless cal Fruit downy not rugose
9678 Radic lvs reniform 7-lobed, caul roundish trunc at base 5-lobed lobes trifid, Pet length of awned cal.
9679 Leaves 5-parted lobes multifid linear, Petals emarginate length of awned calyx, Fruit smooth
9680 Leaves 5-parted lobes trifid linear, Petals emarginate length of awned calyx, Fruit hairy
9681 Lvs 5-lob beyond middle: lobes cut 3 5-fid, Ped clustered at end, Petals emargin length of awned calyx
9682 Lvs 5-lobed. lobes cuneate ovate cut-tooth Hair of stem spread hispid, Pet emarg length of awned calyx
9683 Lvs 5-lob. upp 3-lob lobes obl coarsely and irreg tooth Hair of stem spread hisp Pet shorter than cal
9684 Very smooth, Leaves rounded 5-lobed, Calyx pyramidal angular transversely wrinked, Fruit muricate
9685 Leaves 3-5-parted: lobes trifid pinnatifid, Petals entire twice as long as the angular awned calyx
9686 Like the last, but the petals only a little longer than calyx
9687 Stem prostrate nodose, Leaves opposite deeply 5-lobed

9688 Stamens length of cor Pedunc aggregate, Branches smooth

DODECANDRIA.

9689 Leaves palmate 5-parted, Segm finely bipinnatifid, Petioles and calyxes smooth
9690 Leaves palmate 5-parted, Segm 3-parted pinnatifid, beneath calyxes and petioles hairy
9691 Leaves cordate 5-7-fid · lobes blunt serrated, beneath petioles and calyxes somewhat hairy
9692 Leaves ovate oblong subcordate crenate wavy, Stipules rigid, Pedunc 1-fl with 2 bractes
9693 Leaves ovate mucronate entire, some subsessile, some on long stalks



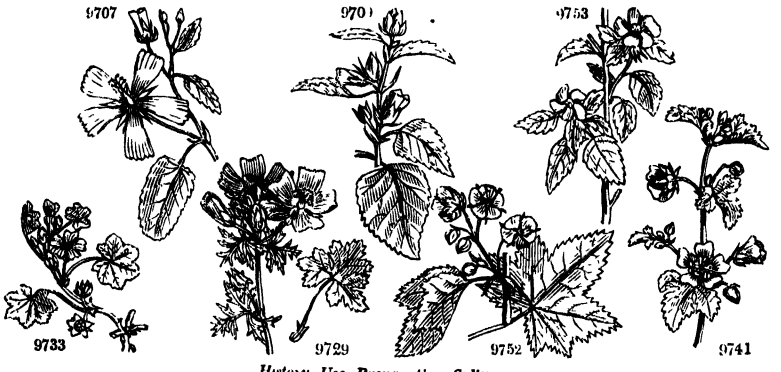
9694 Decandrous, Leaves cordate finely serrate downy beneath, Peduncles 2-flowered, Calyxes sub-bilabiate
9695 Decandrous, Leaves cordate crenate velvety with down on each side, Flowers subterminal few corymbose
9696 Decandrous, Leaves cordate ovate tooth-serrate acuminate rough, Flowers axillary
9697 Leaves cordate acuminate serrate downy green, Peduncles axillary few-flowered, Fruit-stalk very long
9698 Leaves cordate lanceolate crenulate downy beneath rusty, Fl terminal subracemose

9699 Young leaves downy, adult smoothish cordate 7-nerved crenate, Corymb bifid
9700 Leaves downy beneath smooth above ovate oblong 7-nerved subcordate-peltate toothed

9701 Leaves hastate lanceolate serrate
9702 Leaves ovate serrated

9703 Leaves roundish cordate acuminate very large, Stipules large persistent ovate wavy

9704 Leaves oblong acuminate coarsely somewhat toothed at end, Pedicels scarcely longer than petiole
9705 Leaves cordate blunt toothed
9706 Leaves oblong acuminate entire cordate at base sagittate on one side



and Miscellaneous Particulars.

1466. *Helicteres.* Derived from ἑλιξ, a screw, in allusion to the manner in which the fruit is twisted. Free-flowering plants of easy culture, and increased in sand closely covered They have little or no merit.
1467 *Dombeya* Named after Joseph Dombey, a famous French botanist, who travelled in Peru with Ruiz and Pavon, in 1777 Ripened cuttings root in sand in moist heat.
1468. *Pentapetes* One of the names given by the Greeks to the Cinquefoil, but having no reference to the present genus, except that the calyx and capsules are in five. The species are of easy culture in any rich light soil, and are readily increased by cuttings in sand
1469. *Astrapæa* So called from ἀστραπη, lightning, in allusion to the splendid colors of the flowers. A noble genus, remarkable for the large heads of flowers, and the great dilated stipules at the base of the leaves.
1470. *Pterospermum.* From πτερον, a wing, and σπερμα, a seed. Light soil suits the plants, and cuttings with their leaves on root in sand covered close.

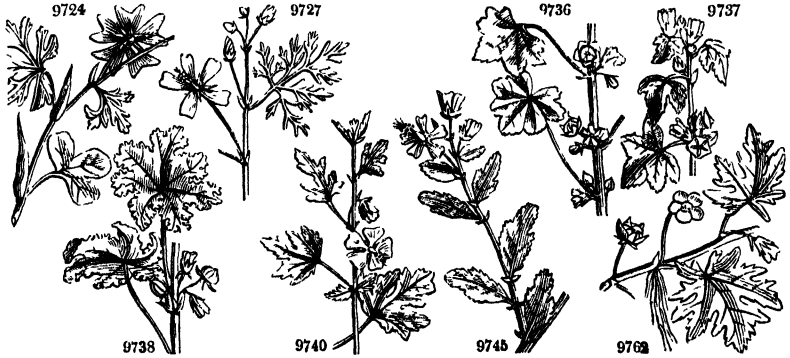
History, Use, Propagation, Culture,

1471. *Malope.* A name given by the Greeks to the Tree Mallow

1472 *Malva* Altered by the Latins from the Greek word, μαλαχη, soft, in allusion to the soft mucilaginous qualities of the species Some of the species are shewy plants, and M capensis is valued in small greenhouses as flowering all the year M sylvestris, *Mauve*, Fr., has still a place in the Materia Medica, on account of its



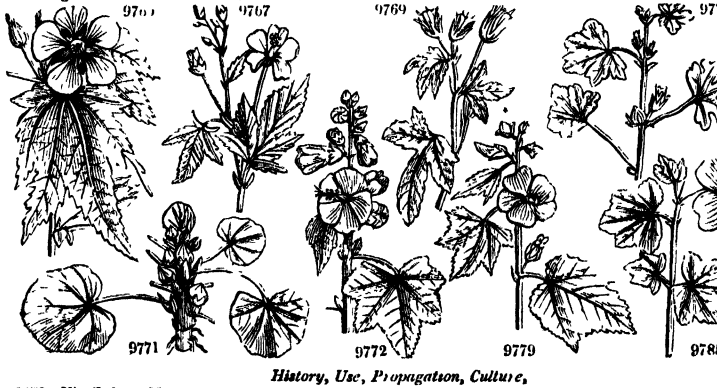
POLYANDRIA.

9707 Leaves ovate crenate, Stipules oblong-linear
9708 Leaves 3-nerved trifid toothed smooth. lobes acuminate

9709 Leaves oblong or ovate acute serrate, Flowers axillary clustered
9710 Leaves ovate acute crenate serrate hairy, Fl axillary subsolitary
9711 Leaves ovate-lanceolate doubly toothed obsoletely 3-lobed beneath rough, Peduncles axillary 2-flowered
9712 Leaves ovate crenate-serrate beneath velvety, Fl axillary clustered
9713 Leaves ovate acute coarsely toothed pubescent, upper cuneate at base, Fl. axillary and terminal spiked
9714 Leaves ovate acuminate serrate rough, Fl axillary and terminal spiked
9715 Leaves ovate or subcordate rough above downy beneath, Flowers in ovate spikes
9716 Leaves cordate crenate blunt and branches downy, Flowers lateral heaped
9717 Leaves subcordate acute toothed downy beneath, Fl sessile, Lobes of calyx ovate
9718 Leaves cordate acuminate serrated rough, lower lobed, Pedunc axillary, Flowers in heads
9719 Leaves cordate blunt smooth, Flowers sessile heaped
9720 Dwarfs, Leaves ovate toothed adult smoothish, younger hairy, Fl axillary solitary on short stalks
9721 Leaves reniform broadly crenate and branches leprous, Stems prostrate
9722 Leaves cordate roundish 5-angled crenate villous, Pedicels longer than petiole
9723 Leaves half orbicular crenate, upper rhomboid, Stem erect hairy
9724 Lower leaves 3-lobed entire, upper multifid, Segm trifid toothed at end
9725 Leaves 3-parted, Segm trifid ciliated toothed at end, Cor less than calyx
9726 Leaves 3-parted, Segm trifid linear blunt, Cor 3 times as large as calyx
9727 Leaves many-parted lobes trifid linear, Stem decumbent, Hairs stellated
9728 Lower leaves angular, upper 5-parted cut, Stems and calyxes velvety
9729 Lower leaves reniform cut, cauline many-parted, Segments linear, Stems and calyxes hairy

9730 Leaves palmated lobes lanceolate toothed, Hairs simple, Pedicels longer than leaf
9731 Stem erect, Leaves 5-lobed blunt, Pedicels and petioles smoothish or downy on the upper side
9732 Stem erect, Leaves 5-7-lobed acute, Pedicels and petioles hairy
9733 Stem prostrate, Leaves cord orbic bluntly 5-lobed, Pedicels in fruit drooping and petioles downy

9734 Stem diffuse, Lvs cord orbicular 7-lobed soft lobes acute, Fls aggreg stalked, Leaves of involucre bristly
9735 Stem erect, Leaves cordate roundish about 9-lobed crenate smooth, Fl axillary sessile clustered
9736 Stem spreading, Leaves roundish bluntly angular crenate smoothish, Fl axillary sessile clustered
9737 Stem erect, Leaves cordate roundish bluntly angular, Fls axill clustered sess Cal rough somew inflated
9738 Stem erect, Leaves angular toothed crisp smooth, Flowers axillary sessile
9739 Pedicels 1-flowered aggregate shorter than leaf, Involucre ovate acuminate, Leaves 5-lobed hairy rugose
9740 Pedicels 1-flowered solitary or twin longer than petiole, Involucre linear, Leaves cut crenate smooth rigid
9741 Pedicels 1-fl solitary or twin longer than petiole, Involucre lanc Lvs 5-lobed or 3-lobed cren toothed glutin.
9742 Pedicels 1-fl solitary longer than petiole, Involucre obl linear, Lvs sub-three-lobed acute unequally toothed
9743 Pedicels 1-flowered solitary length of leaves, Leaves subsessile cuneiform trifid entire
9744 Pedicels solitary longer than petiole, Leaves lobate plaited toothed roughish, Branches divaricating
9745 Pedicels solitary longer than petiole, Involucre lanceolate, Leaves oblong very blunt 3-lobed toothed
9746 Pedicels solitary 1-fl twice as long as petiole, Involucre ovate acute very large, Leaves cordate crenate hairy
9747 Pedicels solitary 1-fl length of petiole, Involucre lanc Leaves cordate 5-lobed toothed, Branches glutinous
9748 Pedicels solitary 1-fl length of petiole, Involucre nearly linear, Leaves ovate about 3-lobed toothed hairy
9749 Pedicels solitary 1 or 2-fl shorter than petiole, Leaves cordate about 5-lobed blunt rough with stellat hair
9750 Pedicels solitary 1-3-fl length of petiole, Involucre obl linear, Leaves sinuate lobed serrate rugose hairy
9751 Pedicels 1-2-fl solitary longer than petiole, Involucre linear, Leaves 5-lobed blunt rugose very rough
9752 Leaves angular acute cordate villous, Petals obcordate shorter than calyx, Pedunc panicled
9753 Leaves ovate 3-lobed toothed downy, Pedunc axillary racemose few-flowered
9754 Leaves angular 5-lobed, middle lobe largest, Pedunc axillary racemose, Flowers 1-sided
9755 Leaves palmate, Spikes axillary 1-sided, Fruit toothletted
9756 Leaves 7-lobed rugose, Spikes axillary 1-sided, Fruit smooth
9757 Leaves 5-lobed lobes pinnatifid sinuate toothed, Pedunc corymbose capitate, Fruit with two beaks
9758 Leaves subpeltate 5-lobed blunt, Pedunc axillary umbelled, Involucre obovate stipitate deciduous
9759 Leaves 5 angular downy, Pedunc axillary bifid few-flowered, Involucre oblong small
9760 Leaves 3-parted hoary, Segm toothed at end, middle trifid, Pedunc axillary 1-flowered
9761 *Leaves lanceolate toothed downy, Pedunc axillary 2 few-fl Involucre setaceous deciduous*
9762 Leaves palmate 5-lobed cut toothed, Pedicels solitary longer than petiole, Fruit villous
9763 Leaves palmate 5-lobed cut toothed, Pedicels solitary longer than petiole, Fruit smooth, Petals entire
9764 Leaves ovate cut toothed lobed, Pedicels longer than petiole, Fruit villous, Petals entire



and Miscellaneous Particulars

demulcent properties, but it is greatly inferior to Althæa, and therefore little used Malva was an excellent vegetable among the Romans, but what species is uncertain A tree of the mallow kind is said, by Prosper Alpinus, to afford food to the Egyptians, and the Chinese use some sort of mallow as food.

All the species are of the easiest culture and propagation

History, Use, Propagation, Culture,

1473 *Kitaibelia.* Named after Dr Paul Kitaibel, professor of botany at Pest, in Hungary, and author, in conjunction with Count Waldstein, of a noble work upon the plants of that country A tall mallow-like plant with vine-like leaves, and white flowers

1474 *Althæa* From ἀλθω, to cure The salutary effects of the mucilaginous root, are well known in medicine *Guimauve*, Fr A officinalis has long been in repute as a demulcent Its roots are sometimes used as an emollient suppurative cataplasm, and a decoction of the leaves forms a useful fomentation in external abrasions, and in cutaneous eruptions, accompanied with a sharp ichorous discharge

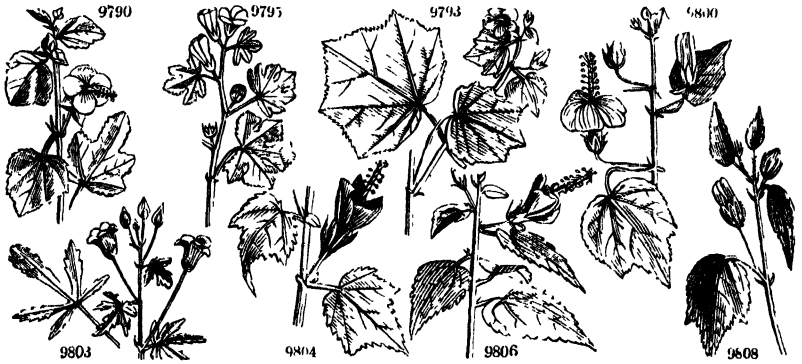
A rosea is the parent of nearly twenty splendid varieties of border flowers, which seed readily, and the offspring generally resembles the parent variety All the species are of the easiest culture in common garden soil

1475 *Lavatera* In memory of two Lavaters, physicians of Zurich, neither the physiognomist, but two friends of Tournefort The species resemble those of Malva, in general appearance and culture much the handsomest is L arborea, which is a magnificent plant in shrubberies, or in the back of wide borders.

9765 Leaves 5-lobed acute toothed

9766 Leaves soft on each side cordate or ovate toothed undivided or 3-lobed, Pedunc axillary many-fl.
9767 Leaves pubescent lower 5-7-parted; upper trifid, Peduncles many-fl longer than leaf
9768 Leaves downy hoary beneath. lower palmate, upper 3-parted lobes narrow coarsely toothed
9769 Leaves cordate rough with hairs smooth above lower blunt, upper 5-lobed, Stem hispid
9770 Leaves smooth cordate roundish lobed toothed, Pedicels axillary clustered 1-flowered
9771 Leaves roundish cordate 5-angled crenate, Pedicels 1-fl much shorter than petiole
9772 Stem upright hairy, Leaves cordate 5-7-angled crenate rugose, Flowers axillary sessile
9773 Stem erect hispid, Leaves roundish cordate, Involucel as long as calyx
9774 Stem upright smoothish, Leaves rounded lobed crenulate serrate, Flowers solitary subsessile
9775 Stem subflexuose hispid, Leaves cordate about 7-lobed blunt on long stalks, Flowers axillary solitary
9776 Stem erect hairy, Leaves palmate 7-lobed beyond the middle lobes oblong blunt irregularly toothed

9777 Leaves 7-angled downy plicate, Pedicels axillary 1-fl clustered much shorter than petiole
9778 Leaves 7-angled acute crenate plaited downy, Racemes terminal
9779 Leaves soft hoary 5-lobed, upper 3-lobed middle lobe elongated, upper oblong undivided
9780 Leaves downy on each side acutely 5-lobed, upper 3-lobed, Flowers solitary on short stalks
9781 Stem hispid, Leaves hoary 5-lobed, upper 3-lobed or undivided, Flowers subsessile
9782 Stem and leaves downy subcordate sub-three-lobed round crenate, Pedicels aggregate, Calyxes acuminate
9783 Leaves 7-angular downy plaited, Racemes terminal
9784 Stem rough, Leaves 5-lobed downy beneath, Peduncles axillary aggregate, Petals emarginate
9785 Stem and leaves downy roundish bluntly angular crenate, Pedicels axillary solitary
9786 Leaves somewhat downy · lower angular, upper 3-lobed middle lobe longer than the rest
9787 Stem herbaceous hispid, Leaves 5-lobed acute, Pedicels axillary 1-flowered aggregate
9788 Stem rough, Leaves somewhat downy lower round cordate, upper 3-lobed, Pedicels solitary 1-fl
9789 Stem herbaceous, Leaves smoothish roundish cordate, upper angular, Pedicels solitary



9790 Leaves cordate roundish bluntly angular toothletted, Involucel stalked 3-leaved 7-flowered, Stem rough
9791 Leaves cordate palmate 5-lobed, Heads stalked 5-leaved 10-flowered, Stem with scattered hairs
9792 Leaves palmate-lobed, Heads stalked 5-leaved many-flowered, Involucel acuminate, Calyxes and stems hairy

9793 Leaves roundish very bluntly 3-lobed velvety on each side 7-nerved 1-glanded, Cal oblong lanceolate
9794 Lower leaves 3 lobed, upper lanceolate panduriform beneath hoary netted with one gland
9795 Leaves trifid downy pale beneath with 3 glands · lobes angular toothletted blunt
9796 Leaves broad ovate cut lobed with narrow recesses lobes acute coarsely and unequally toothed

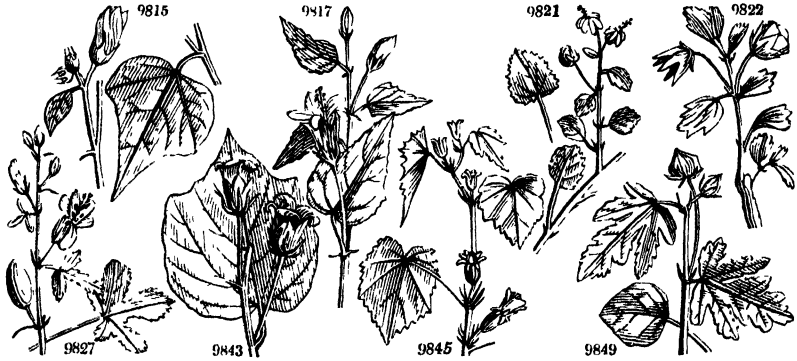
9797 Leaves broadly obovate truncate crenate at end, Pedic axillary 1-fl longer than leaf
9798 Leaves ovate acuminate subcordate doubly toothed, Pedicels axillary 1-fl
9799 Leaves ovate subcordate 3-pointed somewhat toothed and branches covered with viscid hairs
9800 Leaves cordate 3-lobed serrate, Pedicels axillary 1-fl ascending, Involucre 3-leaved
9801 Leaves 5-angular lobes toothed acuminate, Pedic axillary 1-fl much shorter than petiole
9802 Leaves 7-angular acuminate toothed hairy, Fl axillary subsessile clustered
9803 Lower leaves roundish cord crenate others 3-5-lob Pedicels axillary 1-fl Inv 10-leaved setaceous ciliated

9804 Leaves cordate 3-5-lobed acuminate roughish, Leaflets of involucel erect
9805 Leaves cordate about 3-lobed acuminate soft downy, Leafl of involucel somewhat spreading
9806 Leaves cordate crenate blunt or acuminate, Branches and petioles hairy

9807 Leaves ovate acuminate serrate downy beneath, Involucel and calyx downy
9808 Leaves ovate toothed somewhat 3-lobed hoary with down beneath
9809 Leaves lanceolate oblong entire white with scales beneath

and Miscellaneous Particulars

1476. *Malachra* A name under which Pliny speaks of a tree from the north of Persia, producing a certain gum It had no reference to the plant called Malachra by the moderns. Sow in light rich soil, and transplant as with other stove annuals



1477 *Urena*, the vernacular name in Malabar The species are of easy culture, seed freely, or may be propagated by cuttings in sand under a hand-glass

1478. *Pavonia.* In honor of Don José Pavon, the companion of Dombey, in his voyage to Peru, and one of the authors of Flora Peruviana. The species are free-growers, and seed readily. they are also increased by cuttings in sand under a hand-glass.

1479. *Achania.* From *αχαινης*, closed, so called because the corolla does not open out as in most Malvaceous plants, but remains always rolled together

1480 *Hibiscus.* One of the Greek names of the mallow The species are for the most part shewy plants, and not difficult of culture. All of them abound in mucilage, like many of the same natural family, and the

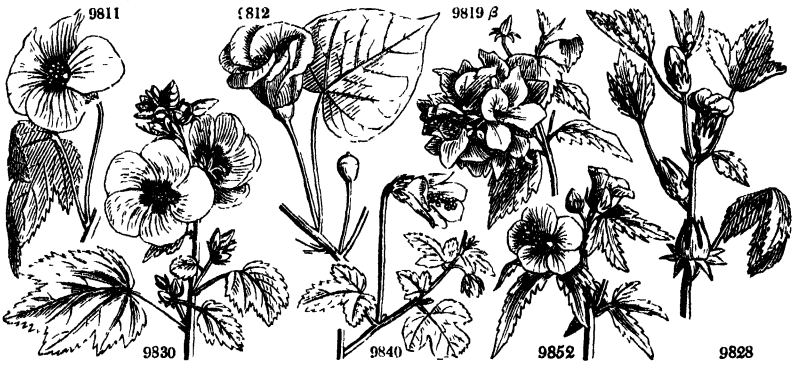
History, Use, Propagation, Culture,

bark of the ligneous sorts may be manufactured into mats or cordage Of H tiliaceus, in the island of Otaheite, they make matting of the bark, as fine as our coarse cloth, also ropes and lines, from the size of an inch to that of a small packthread, and fishing nets (*Hawks Voy* ii. 217) Forster informs us, they also suck this bark for food, when the bread-fruit fails them and in New Caledonia, the inhabitants frequently subsist on it, though it is an insipid food, affording very little nourishment

H. Rosa-sinensis is extremely common in the gardens of China, and the East Indies, but its native country is unknown Loureiro, however, affirms, that it is spontaneous as well as cultivated both in China and Cochin-China; and that it is so common in the latter, that they have entire hedges of it to their gardens It has been long known from its appearance on Chinese screens and paper hangings The variety with double flowers is most frequently cultivated, both in the East and in European hothouses: the plant is, indeed, rarely seen with single flowers (*Smith, spicil*)

H. syriacus is one of our most beautiful hardy shrubs, the more valuable as it is a free-flowerer, will grow in common garden soil, and propagates freely by seeds, layers, and even by cuttings.



H. Sabdariffa (the Turkish name) in the West Indies is called Red Sorrel The calyxes and capsules, freed

9810 Leaves ovate acuminate bluntly serrate hoary on each side, Pedicels axillary 1-fl
9811 Leaves 3-lobed hastate acuminate serrate smooth on each side, Pedicels jointed in the middle
9812 Leaves roundish cordate acuminate (*Thespesia* Dec.)
9813 Leaves roundish cordate acuminate crenate hoary beneath, Involucre 10-toothed
9814 Leaves roundish cordate entire hoary beneath, Peduncle very short 1-flowered
9815 Leaves cordate 3-pointed smooth dotted beneath, Pedicels solitary 1-fl. longer than petiole
9816 Leaves cordate acutely serrate, Branches somewhat hairy
9817 Leaves cordate ovate-lanceolate acuminate toothed, Pedicels twice as long as petiole
9818 Leaves roundish cordate acuminate finely toothed hairy beneath, Pedicels thick villous
9819 Leaves ovate acuminate smooth entire at base coarsely toothed at end, Pedicels length of leaf

9820 Leaves ovate acuminate serrate, lower subcordate 3-pointed, Pedicels jointed at end
9821 Leaves ovate or roundish undivided serrated rough, Pedicels longer than leaf, Cor reflexed
9822 Leaves cuneiform about 5-toothed hairy, Pedicels longer than leaf, Involucre 8-10-leaved hispid
9823 Leaves cordate angular 5-lobed acuminate toothed downy, Pedicels nearly as long as leaf

9824 Leaves cuneiform ovate 3-lobed toothed, Peduncle scarcely longer than petiole, Involucre 6-7-leaved

9825 Leaves cordate 5-lobed hairy. lobes acuminate subrepand, Involucre 6-7-leaved setaceous [undivided
9826 Stem and petiole prickly, Pedicels short unarmed very hairy, Leaves 3-5 lobed blunt toothed, upper oblong lanceolate
9827 Stem prickly, Leaves palmate 5-lobed, upper 3-lobed lobes blunt unequally toothed narrowed at base
9828 Leaves toothed lower ovate undivided, upper 3-lobed cuneate at base, Flowers subsess Involucre 12-toothed
9829 Leaves palmate 5-parted lobes lanceolate acuminate subserrate at end, Pedicels jointed under the end
9830 Stem hairy, Leaves on long stalks ovate about 3-lobed serrate membranous smoothish, Peduncle very short
9831 Stem prickly, Leaves linear lanceolate acuminate usually lobed prickly-serrate, Involucre 10-leaved
9832 Stem prickly, Leaves palmate 5-parted with 1 gland beneath, Fl subsess Calyx covered with glandular hairs
9833 Stem rough with recurved prickles, Stipules 4-cord Leaves palmate 5-lobed, Pedicels length of petiole
9834 Stem rough with recurved prickles, Stipules lanceolate Leaves 5-7-parted with lanceolate acuminate serrated lobes
9835 Leaves smoothish palmate lobes 5-7-acuminate coarsely toothed, Involucre hispid 4-6-leaved, Fls declinate
9836 Stem rough, Leaves rough roundish truncate at base, upper palmate-lobed lobes dilat crenate upwards
9837 Stem petioles and calyx muricate, Leaves ovate at base trifid, lower 5-fid lobes acuminate serrate
9838 Leaves palmated lobes lanceolate serrate, Petioles muricate, Fl subsessile solitary, Involucre 7-fid
9839 Leaves subpeltate cordate 7-angular acuminate serrate, Stem hispid, Pedicels longer than petiole
9840 Leaves 3-5-lobed blunt crenate hairy, Pedicels twice as long as leaf, Involucre many-leaved, Cor campanulate
9841 Leaves cordate 5-lobed blunt toothed, Petioles longer than fl Involucre 10-leaved deciduous Calyx bursting lengthwise
9842 Stem strigose, Leaves 3-lobed angular cordate toothed downy, Peduncle longer than petiole
9843 Leaves cordate angular sparingly toothed nearly smooth, Branches velvety, Caps turbinate truncate hispid
9844 Stem prickly, Leaves smoothish coarsely toothed without glands, Leaves of the involucre with a tooth inside
9845 Leaves cordate unequally toothed beneath hoary lower about 5-lobed, upper acuminate Pedicels 1-fl very short
9846 Stem somewhat prickly, Leaves smoothish toothed 5-angular acuminate, Fls cernuous, Caps 5-winged hairy
9847 Leaves acuminate unequally toothed subvillous lower undivided cordate, upper ovate-cordate 3-lobed
9848 Leaves cordate oblong toothed bluntish angular slightly 3-lobed smooth, Pedicels longer than petiole
9849 Lvs toothed lower undivided, upper 5-fid lobes oblong nearly equal blunt, Cal inflat membranous nerved
9850 Lvs toothed lower undivided, upper 3-parted lobes lanceolate middle one very long, Cal infl membranous nerved
9851 Leaves toothed lower leaves 3-lobed, upper 5-parted blunt, Stem hispid
9852 Leaves hairy 5-lobed lobes linear oblong coarsely toothed, Cal very villous longer than involucrum

and Miscellaneous Particulars

from the seeds, make very agreeable tarts, and a decoction of them, sweetened and fermented, is commonly called sorrel cool drink. It is a small diluting liquor, much used in our sugar colonies, and reckoned very refreshing in those sultry climates. (*Browne's Jam*.) The bark of this species, and also of H cannabinus, is full of strong fibres, which the inhabitants of the Malabar coast prepare and make into cordage, and it seems as if it might be wrought into fine strong thread of any size

The leaves of H surattensis are gratefully acid, and eaten in salads. The mucilage of the root of H manihot is used in Japan for giving consistence to paper

H. Abelmoschus, from the Arabic *Ab-el-Mosch*, grain or seed of musk, has large seeds of a very musky odor, and are frequently used as a substitute for animal musk in scenting powders and pomatums In Arabia and Egypt they are ground and mixed with coffee, to render it more agreeable to the head and stomach

H. esculentus, the Okro of the West Indies, is cultivated there, and in some parts of France, for the pods, which are gathered green and used in soups, or pickled like capers. They are full of a nutritive mucilage, and buttered and spiced make a very rich dish.

History, Use, Propagation, Culture.

1481 *Gossypium* Pliny says, that in Upper Egypt, on the borders of Arabia, grew a shrub called *gossypion* or *xylon* Its fruit enclosed a sort of soft white wool, of which the garments of the Egyptian priests were manufactured Golius remarks, that *goz*, which expresses in Arabia, a silky substance, may be the root of the word An important genus, as furnishing the down used in the cotton manufacture This down is found lining the capsules which contain the seeds There are several species cultivated for this purpose in different parts of the world G herbaceum is the only species cultivated in Europe, especially in the Levant, and in Malta, Sicily, and Naples it is also grown in many parts of Asia

G hirsutum is occasionally grown in the West Indies, but G barbadense is the prevailing species there. In the East Indies and China, G herbaceum and arboreum are cultivated, and some other species, especially that which produces the nankeen-colored down, not yet introduced to Europe An oil is obtained from the seeds of all the species, while those of the G herbaceum are eaten in the Levant, and esteemed wholesome and nutritive

In the Levant, the herbaceous cotton is sown in well prepared land in March, in lines at three feet distance, and the patches of seeds two feet apart in the lines The plants are thinned out to two or three in a place, and the earth is stirred by a one-horse plough, or by manual labor with hoes, and irrigated once or twice a week by directing the water along the furrows between the rows The flowering season is generally over about the middle of September, and then the ends of the shoots are pinched off to determine the sap to the capsules The capsules are collected by hand as they ripen, a tedious process, which lasts till the end of November. The cotton and the seeds are then separated by manual labor, and the former packed in bales or bags for sale The seeds are bruised for oil or eaten, and a portion kept for sowing

The Barbadoes cotton plant is sown in the West Indies in rows, about five feet asunder, at the end of September, or the beginning of October, at first but slightly covered, but after it is grown up, the root is well moulded. The soil should not be stiff nor shallow, as this plant has a tap-root The ground is hoed frequently, and kept very clean about the young plants, until they rise to a moderate height It grows from four to six feet high, and produces two crops annually, the first in eight months from the time of sowing the seed, the second, within four months after the first, and the produce of each plant is reckoned about one pound weight. The branches are pruned or trimmed after the first gathering, and if the growth is over luxuriant,

9843 Leaves 5-lobed 1-glandular beneath: lobes round mucronate, Invol. serrate, Stem smooth
9854 Leaves 5-lobed palmate · lobes lanceolate blunt mucronate with 1 gland beneath, Invol. nearly entire
9855 Lower leaves 5-lobed palmate, upper 3-lobed with 1 gland beneath, Inv tern Cal. with 3 glands at base
9856 Upper leaves undivided cordate, lower 3-5-lobed with 1 gland beneath, Branches and petioles hirsute
9857 Upper leaves 3-lobed, lower 5-lobed with 1 gland beneath, Branches and petioles spotted with black
9858 Upper leaves 3-lobed, lower 5-lobed with 3 glands beneath, Stem smoothish

9859 Leaves ciliated elliptical entire rarely trifid

9860 Smoothish prostrate, Peduncles nearly as long as petiole

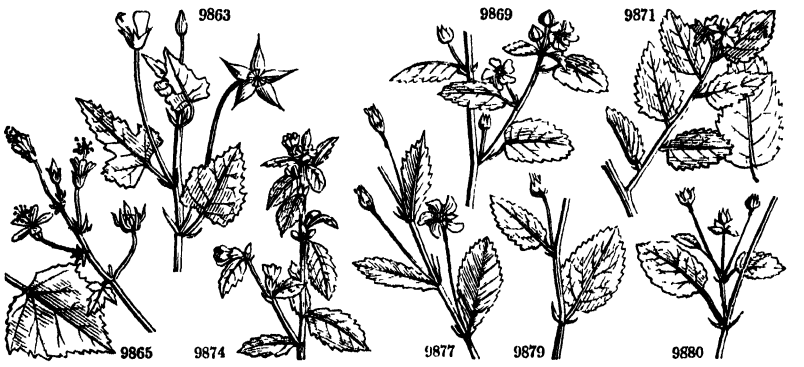
9861 Leaves very ca-sious, Stem very short

9862 Lower leaves cordate acuminate 5-angled somewhat toothed blunt, upper hastate acuminate
9863 Leaves all crenate lower roundish cordate blunt 5-angled, upper round hastate acuminate
9864 Lower leaves triangular hastate crenate, upper ovate lanc nearly entire, Ped sol axill length of leaves

9865 Lower leaves cord about 5-lobed hastate upper hastate, Petals erect spatulate somewhat toothed at end

1 *Capsules 5-12, 1-seeded, not bladdery*

* *Flower-stalks not longer than the leafstalk Leaves oblong or ovate*



9866 Leaves linear entire much longer than the diameter of the flower, Racemes terminal
9867 Leaves linear-lanceolate toothed, A spiny tubercle at the base of the leaves, Pedic axill subsolitary
9868 Leaves ovate-lanceolate toothed, A spiny tubercle at the base of the leaves, Pedic axillary solitary
9869 Leaves oblong ovate subcordate blunt tooth, Pedicels as long as petiole
9870 Leaves ovate-lanceolate acuminate toothed smooth, Branches round downy, Rac very short bracteolate
9871 Leaves ovate-oblong doubly serrate, Pedunc axillary very short about 4-flowered, Branches flattened
9872 Leaves rhomboid narrowed at base serrate-toothed forwards beneath downy, Pedicels shorter than petiole
9873 Lvs ellipt. subov blunt toothed at end, Pedic axill solitary very short, Stipules ciliated longer than flow
9874 Lower lvs roundish ov., upp obl toothed cun and nearly ent. at base, Pedic axill many shorter than pet.

** *Flower stalks elongated, distinctly jointed Leaves oblong or ovate*

9875 Lvs ovate lanc acumin toothed hoary beneath, Branches compr dotted, Pedic thrice as long as petiole
9876 Leaves lanceolate toothed smooth, Pedic axillary 1-fl length of leaf
9876 Leaves oblong-lanceolate toothed cuneate at base hoary beneath, Pedic axillary 1fl shorter than leaf
9878 Leaves somewhat rhomboid retuse crenate towards the end hoary beneath, Pedic longer than petiole
9879 Leaves ovate blunt serrated downy shining, Pedic axillary solitary much longer than petiole

*** *Flower-stalks elongated Leaves cordate at base, toothed, not lobed*

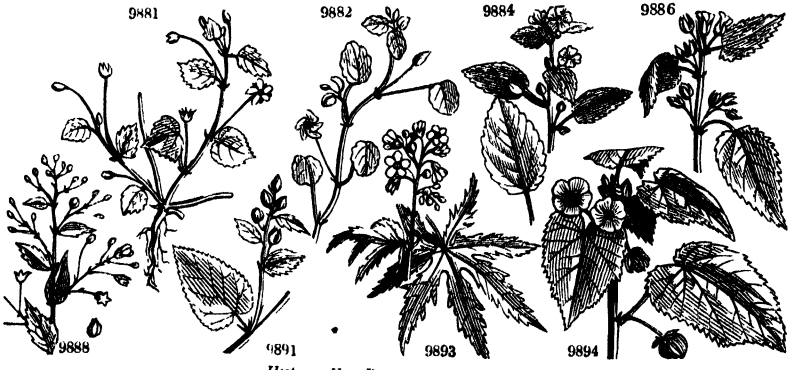
9880 Leaves ovate cordate blunt toothed, Pedicels solitary 1-flowered longer than petiole

and Miscellaneous Particulars

this should be done sooner When great part of the pods are expanded, the wool is picked, and afterwards cleared from the seeds by a machine called a gin, composed of two or three smooth wooden rollers of about one inch diameter, ranged horizontally, close and parallel to each other, in a frame, at each extremity they are toothed or channelled longitudinally, corresponding one with the other, and the central roller being moved with a treaddle or foot-lath, resembling that of a knife-grinder, makes the other two revolve in contrary directions The cotton is laid in small quantities at a time upon these rollers, whilst they are in motion, and readily passing between them, drops into a sack placed underneath to receive it, leaving the seeds, which are too large to pass with it, behind The cotton thus separated from the seeds, is afterwards hand-picked and cleansed thoroughly from any little particles of the pods or other substances which may be adhering to it. It is then stowed in large bags, where it is well trod down, that it may be close and compact; and the better to answer this purpose, some water is every now and then sprinkled upon the outside of the bag, the marketable weight of which is usually three hundred pounds. An acre may be expected to produce from two hundred and forty pounds to that quantity, or two hundred and seventy pounds on an average. (*Long's Jam.* vol iii p 686. *&c* and *Browne*)

1482. *Redoutea* Named after P J Redouté, a celebrated French botanical draughtsman, still living His drawings are inferior to those of the Bauers as accurate representations of nature; but they are generally tastefully arranged and please the eye, notwithstanding a coldness of coloring which often injures their effect

1483. *Palavia* In honor of Don Antonio Palau y Verdera, second professor of botany at Madrid, and author of an excellent translation of the Species Plantarum of Linnæus in Spanish



1484 *Cristaria.* From *crista*, a crest, in allusion to the crested form of the capsules. A pretty plant, not very easily preserved It answers better in a peat border than a pot, and is increased by division or seed.

1485 *Anoda* Named by Cavanilles, from *α*, privative, and *nodus*, an articulation, because the peduncles do not possess the joints which are found in Sida, from which the plants of this genus have been extracted

1486. *Periptera* So named from the resemblance of the flowers in form to a shuttlecock, *περιπτερα*.

1487 *Sida* A name of Theophrastus, said by some to have been applied to a Malvaceous plant, but

History, Use, Propagation, Culture,

Adanson is of opinion, that our Nymphæa was the Sida of Theophrastus. The species are free-flowerers of no

9881 Leaves roundish cordate hairy above serrated, Pedicels subsolitary longer than petiole
9882 Leaves roundish cordate bluntish crenate softly velvety, Pedic solitary 1-fl longer than petiole
9883 Leaves cordate serrate attenuated at end downy on the edge of the petiole and the nerves beneath
9884 Leaves ovate cordate toothed somew angular bluntish downy, Pedic sol 1-fl. a little shorter than petiole
9885 Leaves cord. somewhat angular blunt serrate cren downy on each side, Pedic shorter than petiole 1-5-fl
9886 Leaves ovate cordate acuminate toothed, Peduncs 3-4-flowered very short
9887 Leaves cordate ovate acuminate serrate smooth on each side, Peduncles many-fl
9888 Leaves ovate cordate toothed acuminate downy, Peduncs loosely paniculed capillary

**** *Leaves palmate, divided into 3-5-7-9 lobes*

9889 Leaves cordate toothed 3-lobed, middle lobe acute long, Pedicels solitary nearly equal to the leaf
9890 Leaves subpeltate 7-lobed lobes lanceolate acuminate pinnatifid toothed, Peduncles many-fl
9891 Leaves subpeltate 5-lobed lobes ovate acute toothed undivided, Peduncles about 1-flowered
9892 Leaves palmate 5-lobed smooth lobes oblong acuminate toothed, Peduncles many-fl
9893 Leaves palmate 7-lobed rough lobes lanceolate cut-toothed, Peduncs many-fl bracteate corymbose

2 *Capsules* 15-40, *1-seeded, bladdery*

9894 Leaves oblong cordate toothed somewhat lobed, Peduncels solitary shorter than petiole
9895 Lvs cord ovate acute toothed downy on each side, Petioles and pedicels hairy, Stip setaceous spreading
9896 Lvs. cord roundish acumin tooth velvety, Petioles and branches with spreading hairs, Peduncs very short

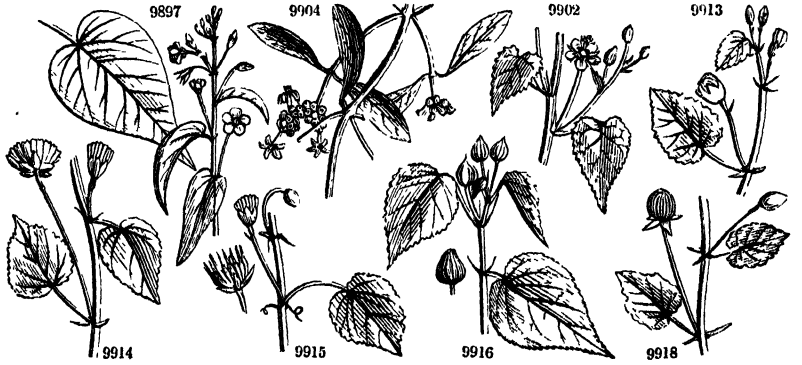
3. *Capsules* 5-10, *many-seeded, often bladdery*

* *Capsules* 5-8

9897 Leaves cord lanc. acuminate entire downy beneath, Pedicels divided slender longer than petiole
β Leaves narrow rough above
γ Leaves more cordate smooth and a little rugose above
9898 Leaves subpeltate cordate ovate acuminate entire downy, Peduncs 1-fl shorter than petiole
9899 Leaves roundish cordate acuminate entire downy beneath, Panicle terminal racemose
9900 Leaves cordate shortly acuminate subcrenate slightly downy and green on each side, Panicle leafless
9901 Lvs deeply cord with a narr base acumin serrul hairy above hoary beneath, Stips broad-eared acumin
9902 Leaves cordate acuminate serrulate velvety on each side, Pedicels solitary 1-flowered
9903 Leaves hoary cordate acuminate acutely crenate, Pedicels 1-fl longer than petiole
9904 Leaves roundish cordate toothed angular acuminate, Pedicels 4-fl umbelled axillary

** *Capsules 9 or more*

9905 Leaves roundish cordate acuminate crenate downy, Pedicels sol longer than petiole
9906 Leaves cordate acuminate crenate velvety, upper sessile, Pedicels sol longer than petiole
9907 Leaves round cordate acuminate crenate downy, Pedicels longer than petiole
9908 Leaves roundish cordate acuminate toothed downy beneath, Pedicels longer than petiole
9909 Leaves roundish cordate unequally toothed soft, Peduncs 2-3 fl shorter than petiole, Capsules acuminate
9910 Leaves roundish cordate with a broad sinus acuminate toothed soft, Pedicels shorter than petiole
9911 Leaves cordate oblong undivided downy, Pedicels shorter than leaf
9912 Leaves roundish cordate acuminate toothed downy, Peduncles shorter than petiole
9913 Leaves cordate ovate oblong toothed velvety on each side, Pedicels longer than petiole
9914 Leaves roundish cordate acuminate toothed downy, Peduncles longer than leaves
9915 Leaves roundish cordate acuminate unequally repand toothed downy, Peduncles longer than petiole
9916 Leaves roundish cordate acuminate toothed velvety, Peduncles 2-flowered shorter than petiole
9917 Leaves ovate orbicular reniform toothed hoary beneath, Pedicels longer than petiole
9918 Leaves cordate somewhat lobed soft, Stipules reflexed, Pedicels erect 3 times as long as petiole
9919 Leaves ovate cordate toothed tricuspidate, Pedicels twice as long as petiole
9920 Leaves roundish cordate acuminate toothed hoary on each side, Pedicels length of petiole
9921 Leaves cordate subpeltate 3-5-lobed unequally toothed villous, Pedicels 1 flowered longer than petiole

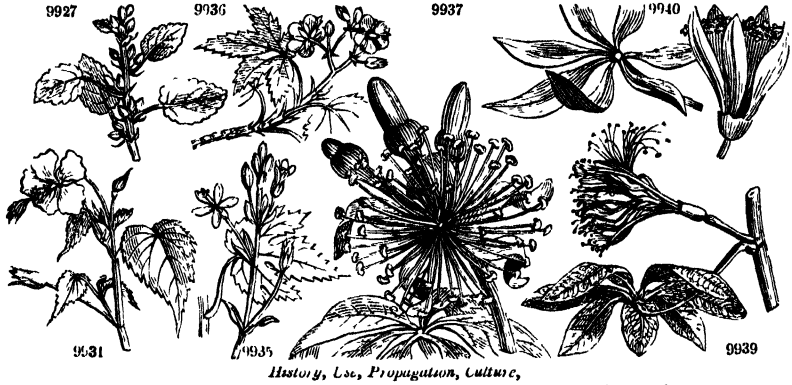


4 *Uncertain species*

* *Leaves linear, oblong, ovate, or lanceolate*

9922 Leaves linear lanceolate toothed villous beneath, Pedicels axillary 1-fl
9923 Leaves lanceolate very long entire hairy, Racemes terminal very short
9924 Leaves broad lanceolate obtuse crenate entire at base 3-nerved, younger downy beneath
9925 Middle leaves oblong blunt acutely crenate in front, upper lanceolate acute serrated in front
9926 Leaves oblong lanceolate serrated entire at base smooth, Peduncs axillary solitary longer than petiole
9927 Leaves ovate acuminate 5-nerved scarcely toothletted, beneath and branches downy, Stipules filiform

** *Leaves cordate, undivided*



9928 Leaves subcordate sessile serrate subvillous, Flowers axillary clustered
9929 Stem warted, Leaves cordate lanceolate acuminate acutely crenate downy
9930 Leaves cordate acuminate crenate toothletted, and stems green and downy, Pedic axillary 1-fl
9931 Leaves cordate acuminate cut serrate, Peduncles solitary longer than petiole
9932 Leaves cordate acuminate repand rarely crenate hoary, Panicle contracted bracteate
9933 Leaves cordate acute crenate rugose and stems yellow with down, Flowers subsessile aggregate
9934 Leaves cordate acuminate hoary beneath, Pedicels axillary 1-flowered longer than petiole

and miscellaneous Particulars.

great beauty They are increased by seeds, which they produce freely, or by cuttings in sand under a hand-glass.

History, Use, Propagation, Culture,

1488 *Lagunea* Named after Andreas Laguna, a Spanish naturalist, who published, in 1543, a work upon plants. It may be treated like other tender annuals.

1489 *Ruizia* In honor of Don Hippolito Ruiz, author of Quinologia, Madrid, 1792, and other works, and, in conjunction with Pavon, of the famous Flora Peruviana A plant of easy culture, but of little merit.

1490. *Carolinea.* Named by the younger Linnæus, in honor of the Princess Sophia Caroline, of Baden, a name which, he says, will always be cherished by botanists A splendid family, which thrive in loam, and large cuttings, well clothed with leaves, root in sand under a hand-glass

1491 *Adansonia* In honor of Michel Adanson, a famous French botanist, born in 1727, and author of various works, of which his voyage into Senegal, and Familles des Plantes, are the most remarkable He was an eccentric man, but certainly far more learned for his time than many of his modern detractors Monkies'-bread, or Boabab, is considered the largest or rather broadest tree in the world Several measured by Adanson were from sixty-five to seventy-eight feet in circumference, but not extraordinarily high. The trunks were from twelve to fifteen feet high, before they divided into many horizontal branches, which touched the ground at their extremities, these were from forty-five to fifty-five feet long, and were so large, that each branch was equal to a monstrous tree, and where the water of a neighbouring river had washed away the earth, so as to leave the roots of one of these trees bare and open to the sight, they measured one hundred and ten feet long, without including those parts of the roots which remained covered It yields a fruit which resembles a gourd, and which serves for vessels of various uses, the bark furnishes a coarse thread, which they form into ropes, and into a cloth, with which the natives cover their middle from the girdle to the knees, the small leaves supply them with food in a time of scarcity, while the large ones are used for covering their houses, or, by burning, for the manufacture of good soap. At Sierra Leone this tree does not grow larger than an orchard apple-tree

The ligneous part of this tree appears to be of little or no use as timber. In our stoves it grows in rich soil in heat, and cuttings root in sand, covered and plunged.

1492 *Bombax* From βομβυξ, one of the Greek names of the cotton, the seeds of the plants now so called are enveloped in a cottony substance B pentandrum bears oval fruit larger than a swan's egg, having a thick woody cover, which, when ripe, opens in five parts, and is full of a short dark cotton, inclosing many roundish seeds as large as small peas

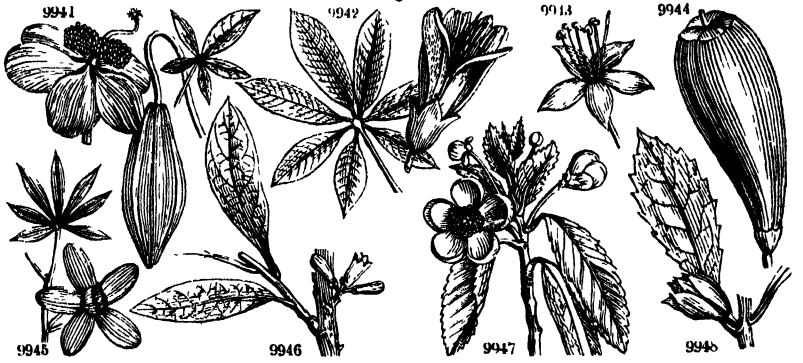
B. Ceiba has a spiny trunk, and is one of the tallest trees of both Indies; but the wood is very light, and not much valued, except for canoes Their trunks are so large as, when hollowed, to make very large ones In the West Indies they frequently carry from fifteen to twenty hogsheads of sugar, and from six to twelve hundred weight each When sawn into boards, and then well saturated with lime-water, the wood bears exposure to the weather many years, it is also formed into laths for roofs, curing-pots, and hogshead-heading. When the tree decays, it becomes a nest for the Macaca beetle, the caterpillar of which, gutted and fried, is esteemed by many persons one of the greatest delicacies The down which is enclosed in the seed-vessels is seldom used, except by the poorer inhabitants to stuff pillows or chairs, and it is generally thought unwholesome to lie upon

9935 Leaves cordate 3-lobed · lobes oval oblong acuminate toothed with a very narrow base

9936 Leaves of the flowering branches palmatifid, of the sterile palmate

9937 Leaves digitate, Filaments numerous forked united at base into a tube
9938 Leaflets 5-8 ovate-lanceolate acuminate
9939 Leaflets 7 elliptical-oblong acute at each end, Calyx truncate, Petals erect
9940 Leaflets 5-7 obovate oblong, Calyx sinuated, Petals erect spreading at end

9941 A tree with a very thick trunk with a diameter of 25 feet



9942 Anthers rectilinear, Leaflets 7, Corolla large woolly outside, Trunk prickly
9943 Anthers antractuose, Leaflets entire, Trunk generally prickly
9944 Stem prickly, Leaves palmate, Leaflets 5, Fruit turbinate concave at end
9945 Stem prickly, Leaves palmate, Leaflets 7 entire acuminate, Fruit oblong blunt

9946 Leaves ovate-oblong, Calyxes turbinate, Column of stamens shorter than petals

9947 Pedicels axillary half as short as leaves, Leaves oblong coriaceous smooth serrated
9948 Fls. subsessile, Leaves obovlanc downy beneath subserrate membranous, Petals and sepals silky outside

9949 Flowers large white, Filaments purple, Anthers blue
9950 Leaves ovate acute, Flowers solitary subsessile

9951 Leaves elliptical oblong subrugose twice as broad as long
9952 Leaves lanceolate flat three times as broad as long

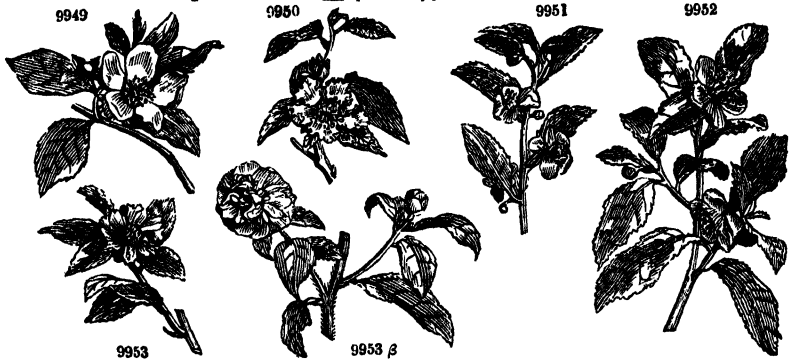
and Miscellaneous Particulars

1493 *Myrodia* From μυρον, myrrh, and οσμη, smell A tree which emits an odor similar to myrrh. (*Linn*)

1494 *Gordonia* In memory of James Gordon, an eminent nurseryman at Mile-End, near London, a correspondent of Linnæus and other eminent botanists, and the introducer and successful cultivator of many new plants G Lasianthus (woolly flower, from λασιος and ανθος), the loblolly-bay, is said to grow naturally in water or very moist situations Miller, on that account, was unsuccessful in keeping the plant Gordon and Lee, who, as Ellis relates, (*Corres with Linnæus*) were better cultivators than Miller, were probably more successful Sweet says, the species are hardy enough to bear our winters in the open air, but the young shoots often get injured, and the summer is not long enough to flower them in perfection, it is therefore better to treat them as greenhouse plants Peat soil suits them best, and a little loam mixed with it: they are readily propagated by layers, or ripened cuttings may be struck in sand under a hand-glass. (*Bot Cult.* 199)

1495 *Stuartia* So named by Linnæus, in honor of the Marquis of Bute, in memory of whom there also exists another genus named Butea, by Roxburgh The species are handsome shrubs, grow in peat soil, and are most readily increased by layers

1496 *Camellia* In honor of George Joseph Kamel, (or Camellus) a Jesuit His Syllabus Stirpium in Insula Luzone Philippinarum, forms the appendix to the third volume of Ray's History This is a remarkable genus, as at once furnishing the domestic drug tea, in universal use, and flowering trees and shrubs as universally admired. The seeds of all the species are crushed for oil, which is used like that of hemp or poppy in cookery



C Bohea and viridis are the species which chiefly furnish the tea, but C Sasanqua is also used, and sometimes the leaves of the other species are taken, though that practice is rather to be considered in the light of adulteration The tea districts of China extend from the twenty-seventh to the thirty-first degree of north latitude. According to the missionaries, it thrives in the more northern provinces, and from Kæmpfer, it appears to be cultivated in Japan as far north as latitude 45° It seems, according to Dr Abel's observation, to succeed best on the sides of mountains, where there can be but little accumulation of vegetable mould The soils from which he collected the best specimens consisted chiefly of sandstone, schistus, or granite The plants are raised from seeds sown where they are to remain Three or more are dropped into a hole four or five inches deep, these come up without further trouble, and require little culture, except that of removing weeds, till the plants are three years old. The more careful stir the soil, and some manure it, but the latter practice is seldom adopted The third year the leaves are gathered, at three successive gatherings, in February, April and June, and so on till the bushes become stinted or tardy in their growth, which generally happens in from six to ten years. They are then cut in to encourage the production of fresh roots

The gathering of the leaves is performed with care and selection The leaves are plucked off one by one. at the first gathering only the unexpanded and tender are taken; at the second those that are full grown; and at the third the coarsest. The first forms what is called in Europe imperial tea; but as to the other

History, Use, Propagation, Culture,

names by which tea is known, the Chinese know nothing, and the compounds and names are supposed to be made and given by the merchants at Canton, who, from the great number of varieties brought to them, have an ample opportunity of doing so Formerly it was thought that green tea was gathered exclusively from C viridis, but that is now doubtful though it is certain there is what is called the green tea district, and the black tea district, and the varieties grown in the one district differ from those grown in the other Dr Abel was told by competent persons, that either of the two plants will afford the black or green tea of the shops, but that the broad thin-leaved plant (C viridis) is preferred for making the green tea

The tea leaves being gathered, are cured in houses which contain from five to ten or twenty small furnaces, about three feet high, each having at the top a large flat iron pan. There is also a long low table covered with mats, on which the leaves are laid, and rolled by workmen, who sit round it the iron pan being heated to a certain degree by a little fire made in the furnace underneath, a few pounds of the fresh-gathered leaves are put upon the pan, the fresh and juicy leaves crack when they touch the pan, and it is the business of the operator to shift them as quick as possible with his bare hands, till they become too hot to be easily endured. At this instant he takes off the leaves with a kind of shovel resembling a fan, and pours them on the mats before the rollers, who, taking small quantities at a time, roll them in the palm of their hands in one direction, while others are fanning them, that they may cool the more speedily, and retain their curl the longer This process is repeated two or three times, or oftener, before the tea is put into the stores, in order that all the moisture of the leaves may be thoroughly dissipated, and their curl more completely preserved. On every repetition the pan is less heated, and the operation performed more closely and cautiously The tea is then separated into the different kinds, and deposited in the store for domestic use or exportation

The different sorts of black and green arise not merely from soil, situation, or the age of the leaf, but after winnowing the tea, the leaves are taken up in succession as they fall, those nearest the machine being the heaviest, are the gunpowder tea, the light dust the worst, being chiefly used by the lower classes. That which is brought down to Canton then undergoes a second roasting, winnowing, packing, &c., and many hundred women are employed for these purposes

As more select sorts of tea, the blossoms of the C sasanqua appear to be collected, the buds also appear to be gathered in some cases By far the strongest tea which Dr Abel tasted in China, was that called *yutsen*, used on occasions of ceremony It scarcely colored the water, and on examination was found to consist of buds and half expanded leaves of the plant

As substitutes for tea used by the Chinese, may be mentioned a species of moss common to the mountains of Shan-tung, an infusion of ferns of different sorts, and Dr Abel thinks the leaves of the common camellia and oil camellia may be added Du Halde observes, that all the plants called tea by the Chinese, are not to be considered as the true tea plant, and Kæmpfer asserts, that in Japan a species of Camellia, as well as the Olea fragrans, is used to give it a high flavor

The oil-bearing Camellia, C oleifera, is cultivated for its seeds, from which an oil is expressed, in very general use in the domestic economy of China It grows best in a red sandy soil, attaining the height of six or eight feet, and producing a profusion of white blossoms and seeds These seeds, as well as those of any of the other species, are reduced to a coarse powder, which is stewed or boiled in bags and then pressed, when the oil is yielded. (*Dr Abel's Nar* 176)

The culture of the tea Camellias in our greenhouses is very simple The plants are very hardy, and may be preserved in a pit without fire-heat, they grow in loamy soil, or loam and peat well drained, and increase freely by layers, or cuttings of the young wood taken off when it begins to ripen, planted in sand, and covered with a hand-glass in a cool frame or pit.

C. japonica, in the groves and gardens of Japan, is a lofty tree, much admired for its fine form, rich clothing of shining deep green foliage, and elegant red or white flowers, single or double. It is equally admired in

9953 Leaves ovate-oblong bluntly serrated, Flowers terminal subsolitary, Petals obcordate

9954 Leaves ovate acuminate acutely serrate Flowers terminal subsolitary

and Miscellaneous Particulars

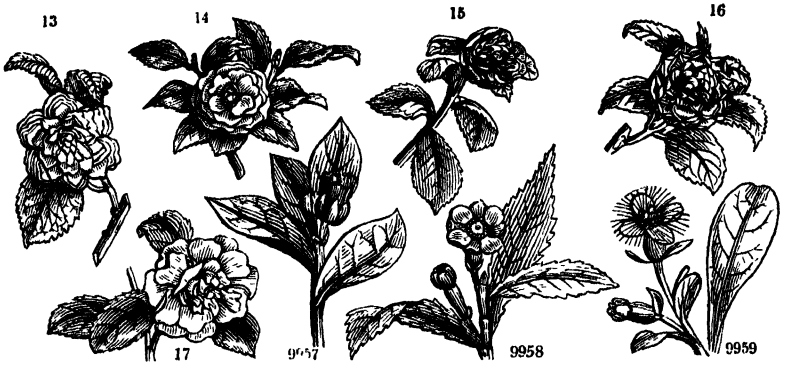
China as in Japan, and much cultivated in both countries It is of frequent occurrence in Chinese paintings, with Hibiscus and Chrysanthemum, two of their great favorites There are several varieties of C japonica in China, most of which have been imported here, and their number considerably increased, and daily increasing, from seedlings raised in this country The double white, double striped, and double Waratah, (from the central petals resembling those of the Waratah plant of New Holland, Telopea speciosissima,) are considered the grandest and most marked varieties, and are also free-growers and flowerers, the pæony-flowered and fringed white, are also standard beauties, but all are much admired

The single red Camellia is propagated by cuttings, layers, and seeds, for stocks, and on these the other sorts are generally inarched, and sometimes budded or grafted The cuttings are formed of ripened or ripening shoots, taken off in August, cut smoothly across at a joint or bud, two or three of the lower leaves only taken off, and the cuttings then planted and made firm with a small dibber, in pans of sand or loam, or, by some cultivators, sand and peat, or sand alone The pans are kept in a pit or cold frame, without being covered with glass, but shaded during powerful sunshine, and in the following spring such as are struck will begin to push, when they are to be placed in a gentle heat In September or October following, the rooted plants will be fit to pot off, and in the second or third spring they may be used as stocks Such is the practice in the London nurseries Henderson, of Woodhall, near Edinburgh, puts in Camellia cuttings at any time of the year, excepting when they are making young wood He puts fifty cuttings in a pot of sand eight inches in diameter, sets them in a cool place in the back of a vinery or peach-house for a month or six weeks, and then plunges them to the brim in a hot-bed where is a little bottom heat. A speedy mode of obtaining stocks is by planting stools in a pit devoted to that purpose, and laying them in autumn, the following autumn most of the layers will have produced roots, when they may be taken off and potted, and used as stocks in the succeeding spring Inarching or grafting is performed early in spring, when the plants begin to grow, the chief care requisite is so to place and fix the pot containing the stock, as that it may not be disturbed during the connection of the scion with the parent plant The graft being clayed over, is then covered with moss to prevent its cracking When independent grafting is resorted to, the mode called side grafting is often used, but the operation of tongueing is generally omitted, as weakening the stock and unnecessary, with a view to prevent the scion from being blown off A few seeds are sometimes obtained from the single red and semi-double Camellias, and from the single Waratah, these require two years to come up, but make the best stocks of any

Before they are grafted they are often allowed to come into flower, in case some new variety should be produced, but the best cultivators, as Messrs Loddiges, Sweet, and Mackay, regularly cross-impregnate the blossoms in Knight's manner, by cutting out the stamens before the anthers are mature, and when the stigma is in a proper state, dusting it with the pollen of the species or variety intended as the male parent.

C Sasanqua seeds most readily, and is mostly employed as the female parent for raising new varieties The plants, if well treated, flower in four or five years, and if nothing new is produced they still make excellent stocks

Some cultivators grow the Camellias chiefly in peat Messrs Loddiges, who have the most numerous collection of this genus, formerly used loam, with a little sand and peat, and they are grown in a similar soil in Hammersmith nursery Of late, Messrs Loddiges find light loam alone to answer as well or better In the Comte de Vandes garden at Bayswater, rotten dung is mixed with loam and peat. Sweet recommends sandy loam and peat Henderson of Woodhall is one of the most successful growers of the Camellia in Scotland his compost is as follows take one part of light-brown mould, one part of river-sand, one part of peat-earth, one half part rotten leaves, mix them all well together, and when the Camellias require shifting, put some broken coal-char in the bottom of the pots, and some dry moss or hypnum over it. (*Caled Mem* iii. 316)



Camellias have the best effect, and are grown to most advantage in a house entirely devoted to them Such

History, Use, Propagation, Culture

a house should be rather lofty, as the plants never look so well as when six or eight feet high, trained in a conic form, and clothed with branches from the root upwards. The plants should be raised near to the glass by means of a stage, which should be so contrived, that, as they advance in height, it may be lowered in proportion only the very best crown or patent glass should be used, because it is found from experience, that the least inequality of surface or thickness of material, so operates on the sun's rays, as to concentrate them, and burn or produce blotches on the leaves of the plants. Every cultivator must have observed that leathery shining leaves, like those of the orange, myrtle, &c are more or less subject to this solar injury, but the leaves of the Camellia are particularly so. Some nurserymen recommend a roof which will not admit much light, others the use of green glass, of an opaque roof, with glass in front only, or of a house facing the north Our opinion is, that a light house facing the south, or, better still, glass on all sides, is essential to the perfect growth of the plants, and that all solar accidents may be avoided, or at least rendered of no consequence, by using the best glass, and placing the plants as near it as possible.

To grow the Camellia to a high degree of perfection, considerable care is requisite The roots are very apt to get matted in the pot, and, by the space they occupy, so to compress the ball of mould, as after a time to render it impervious to water. Hence frequent attention should be had, to see that the water poured on the pots moistens all the earth, and does not escape by the sides of the pot, moistening only the web of fibres When the plants are in flower and in a growing state, they require to be liberally watered, and also a degree of heat somewhat greater than is usually given to greenhouse plants If this heat is not given in November and December, the plants will not expand their blossoms freely, and if both water and heat are not regularly applied after the blossoming season, vigorous shoots and flower-buds will not be produced. To form handsome plants, they should be trained with single stems to rods, and pruned so as to make them throw out side branches from every part of the stem to encourage these, the plants should not be set close together on the stage In summer they may either be set out of doors on a stratum of scoriæ, or on a pavement, in a sheltered but open situation, or the glass roof may be taken off The hardier sorts, as the double red, blush, pæony-flowered, &c answer very well when planted in the bed or border of a conservatory, provided the root or entire superstructure can be removed in summer to admit the full influence of the weather When this cannot be done, the Camellia and most other plants are better in portable utensils, which admit both of examining their roots, and placing them in the open air, or in a greater degree of heat at pleasure The single and double red Camellia will endure the open air when trained against a south wall, and protected by mats in winter, and there can be no doubt that in time these and other species will be more perfectly inured to our climate

Henderson of Woodhall gives the following account of his mode of treating the Camellia "The best time for a regular shifting of the Camellias is the month of February or beginning of March After shifting all those that require it, put them into the peach-house or vinery, when there is a little heat, if there be no peach-house, vinery, nor pinery, set them in the warmest part of the greenhouse. They will soon begin to make young wood From the time they begin to make their young shoots, till they have finished their growth, give them plenty of water They may be kept in the vinery or peach-house till they have formed their flower-buds at the extremity and sides of the young growths, when a few of them may be removed to a colder place, say behind the stage of the greenhouse, for the Camellias are fond of being shaded during

and Miscellaneous Particulars

strong sunshine. In three or four weeks after, a few more of the Camellias may be brought from the vinery or peach-house, and put into a cooler situation This may be repeated three or four times, which will make as many different successions of flowering Those that are wanted to come into flower early, may remain in the warm house till they are beginning to flower, when they should be taken to a cold place, say the coldest place of the greenhouse, then give them plenty of light only, and they will open their flowers well, and stand long A Camellia cannot stand heat when in flower, indeed they seldom open their flowers fine when in heat, and, at all events, the flowers soon fall off Those that are kept all the summer in the vinery, will come into flower by the first or middle of October, and a pretty large plant, having perhaps fifty or a hundred flower-buds, will continue in flower till the month of January Those plants that are removed early from the vinery, will now be in flower, to succeed those that were in flower in October, and have now done flowering These last should be immediately taken into the heat They will make their young wood early, and they may remain in heat till they come into flower, which will perhaps be a month earlier next year By attending to shifting the Camellia plants from the warm-house to the cold, a regular succession of flowers may thus be had from the first of October to the middle of July I have even had them all the summer, but the flowers are best in the winter Those produced in summer are far from being so fine, and do not stand half the time of those that come into flower in November, December, January, February, March and April. Camellias delight to be kept damp all the summer months, and a little shaded from the strong sun Give them plenty of water while they are making their young shoots, they may also get a gentle sprinkling over the leaves once every week during the summer season, except when they are in flower Camellias will stand a great deal of cold without being much injured, but they will not form many flower-buds without some artificial heat" (*Caled Mem* in 316.)

1497 *Barringtonia* In memory of the Hon Dames Barrington, F. R S, an active Fellow of the Society of Antiquaries, and author of several papers in their Transactions A lofty tree, the handsomest in the equinoctial flora. It has thick shady bunches of long wedge-shaped coriaceous leaves, and large handsome purple and white flowers, which open at night, and fall at sunrise They are succeeded by a reddish brown drupe, the seed of which mixed with the bait, inebriates fish in the same manner as Cocculus indicus It grows on the sea shore and at the mouths of rivers, and is cultivated in the governor's garden at St. Helena It is very rare in our stoves, though not difficult to manage Sweet says, "a mixture of two-thirds loam and one-third peat, is a good soil for it Cuttings taken off at a joint, when the wood is ripe, and put in a pot of sand under a hand-glass in moist heat, will strike root readily. none of the leaves should be taken off or shortened" (*Bot Cult* 21)

1498 *Gustavia* In memory of Gustavus III, king of Sweden, who presented a great collection of Indian plants to the elder Linnæus A tree remarkable for its large white flowers, larger than those of the waterlily, but with a large naked bald receptacle between the corolla and the style The flowers smell sweet, but the wood is extremely fetid In Surinam it is used for hoops In the stove it grows in sand and loam, and roots in sand under a hand-glass

1499 *Careya* Named after Dr William Carey, the editor of Roxburgh's Flora Indica, and an English physician and botanist residing at Serampore Beautiful Indian plants, with long red stamens

Class XVII. — DIADELPHIA. Stamens united in two separate parcels.

This class essentially requires, as its name implies, that the stamens should be united in two separate parcels. These may either be equal, each bearing more anthers than one, as in Smithia, Æschynomene, Fumaria, and others, or unequal, one parcel being reduced to a single stamen, and the other bearing several anthers, as in the greater number of genera included in the class But besides the plants whose stamens are thus disposed, it has been the practice to admit other genera having papilionaceous flowers, but with their stamens united in one parcel only, such as Platylobium, Bossiæa, Arachis, and others The propriety of this measure is extremely questionable It has been before remarked in this work, that the value of an artificial arrangement of objects depends wholly upon the precision with which they are referred to those heads or divisions with the characters of which they agree If this does not obtain, an artificial system ceases to be useful, and its only merit, that of facilitating the discovery of the name of a given object, cannot be said to exist. This principle is particularly applicable to the genera just mentioned Their artificial character refers them to Monadelphia, but they are retained in Diadelphia, to which their artificial character does *not* refer them, *because*, as is alleged, of the natural relation which they bear to other genera in Diadelphia If this reasoning, which is only applicable to an arrangement of plants according to their natural affinities, and which has no allowable reference to an artificial system, were to be admitted, it would follow that Tamarindus, actually included in Monadelphia by the most eminent Linnean botanists, and all the papilionaceous genera stationed in Decandria, should be referred hither also With such objections attaching to the contrivance of this class, it is not easy to understand in what way it "does honor to the comprehensive powers of Linnæus's mind," as has been somewhere remarked by one of his most distinguished panegyrists

The structure of the corolla of plants of this class is, for the most part, with the exception of Fumaria and its allies, what has been popularly termed papilionaceous, that is to say, it consists of five petals of different forms and direction, of which the *upper*, called the *vexillum* or standard, is larger than the rest, upon which it is incumbent, the *two lateral*, called the *alæ* or wings, are oblong, distinct, and parallel with the ovarium, and the *two lower*, called the *carina* or keel, are enclosed within the alæ, are also parallel with the ovarium, and cohere by their lower edges, so as together to form, as it were, one boat-shaped petal To this common form of corolla there are, however, some exceptions, as in Amorpha, where the alæ and carina are absent, and in Erythrina, where the alæ are in some cases almost obliterated In Trifolium the petals all cohere by their claws into an undivided tube

With regard to the importance of Diadelphous plants as applicable to the purposes of mankind, they may be said to hold the very highest rank All the numerous varieties of pulse, whether eaten by men or cattle, peas, beans, haricots, caravances, lentils, and others, are all produced by Diadelphous plants The best of our artificial grasses, such as clover, nonesuch, cow-grass, lucerne, saintfoin, serradilla, &c &c, belong to various Diadelphous genera. A large proportion of the class also consists of useful and ornamental trees and herbs, which will be noticed in their respective places

Order 1 PENTANDRIA  Stamens 5.

1500 *Monnieria* Cal 5-parted, with the upper segment long Cor ringent Stamens 2, upper with two anthers, lower with three Caps 5, 1-seeded
1501 *Petalostemum* Petals 4, between the stamens, all united into a slit tube Vexillum none, but in its place a fifth petal Legume surrounded by calyx, 1-seeded

Order 2 HEXANDRIA.  Stamens 6

1502. *Corydalis.* Pet 4, 1-spurred at base Pod 2-valved, compressed, many-seeded.
1503 *Cysticapnos* Petals 4, one gibbous at base Capsule bladdery, many-seeded, the placentas connected by a membranous net work.
1504 *Dicentra* Petals 4, two outer equally spurred or gibbous at base Pod 2-valved, many-seeded
1505 *Adlumia* Petals 4, united in a fungous monopetalous corolla, persistent, and with two protuberances at base Pod 2-valved, many-seeded
1506 *Sarcocapnos* Petals 4, 1-spurred at base Caps 2-valved, not opening, 2-seeded Valves 3-nerved, flattish
1507. *Fumaria* One petal gibbous or spurred at base Cariopsis indehiscent, 1-seeded, not pointed with a style

Order 3. OCTANDRIA.  Stamens 8.

1508 *Polygala* Cal of 5 leaves, two of them wing-shaped and colored. Caps compressed, obcordate
1509 *Muraltia* Sepals 5, glumaceous, nearly equal. Petals 3, united, the middle bifid with blunt lobes. Ovary with 4 horns or tubercles, 2-valved, 2-celled.
1510 *Mundia* Sepals 5, glumaceous, persistent, the two inner wing-shaped. Petals 3, scarcely united at base, the middle one cuculiate, beardless. Stamens 7-8, somewhat villous, monadelphous at base, with a tube divided in front
1511 *Securidaca* Sepals 5, the two inner petaloid. Petals 5, united at base: three united into a 3-lobed keel, two oblong Stamens 8, diadelphous

Order 4 DECANDRIA.  Stamens 10.

1512 *Nissolia.* Cal 5-toothed Legume 1-seeded, ending in a ligulate wing
1513 *Dalbergia* Cal obsoletely 5-toothed Legume leafy, flat, not opening Seeds solitary or twin.
1514 *Pongamia* Cal colored, cyathiform, obliquely truncate, 5-toothed Petals clawed. Vexillum spreading Alæ and carina conniving. Legume substipitate, compressed, flat, rostrate, valveless, 1-2-seeded. Anthers ciliate, glandular at end.
1515. *Pterocarpus.* Cal 5-toothed. Legume falcate, foliaceous, varicose, indehiscent, encompassed by a wing Seeds a few, solitary.
1516 *Ecastaphyllum.* Cal. campanulate, sub-bilabiate: upper segment emarginate, lower trifid. Filaments equally diadelphous. Legume roundish, valveless, 1-seeded.

1517 *Geoffroya* Cal 5-fid. Drupe ovate. Kernel compressed.
1518 *Dipteris.* Segm of cal. 2, wing-shaped. Legume 1-celled, 1-seeded, coriaceous, 2-valved.
1519. *Parivoa.* Cal 3-4-fid. Vexillum ample. Alæ and carina O. Legume compressed, 1-seeded
1520. *Amerimnum.* Cal. sub-bilabiate. Legume compressed, leafy, 2-valved, dehiscent. Some seeds, solitary.
1521 *Erythrina* Cal. bilabiate, ‡. Vexillum very long, lanceolate. Legume torulose.
1522 *Butea.* Cal. sub-bilabiate. Vexillum very long, lanceolate. Legume compressed, membranous, one-seeded at end.
1523. *Viborgia.* Cal 5-toothed, with rounded recesses. Legume turgid, sulcate, winged.
1524 *Piscidia* Stigma acute. Legume with four wings.
1525. *Platylobium* Cal. bracteate, 2-lipped, upper lip round, large, bifid Stam. all united. Legume stalked, compressed, winged at back, many-seeded.
1526 *Borbonia* Stigma emarginate. Calyx acuminate, spiny. Legume mucronate.
1527. *Rafnia.* Cal. ringent. upper lip bifid, lower spreading trifid, the middle tooth narrowest. Legume lanceolate, compressed.
1528 *Aspalathus.* Cal. 5-fid, upper segment largest. Legume ovate, blunt, about 2-seeded.
1529. *Sarcophyllum.* Cal. campanulate, 5-parted, regular. Legume acinaciform, acute.
1530. *Crotalaria.* Legume turgid, inflated, stalked. Filaments united with a dorsal fissure.
1531. *Bossiæa.* Cal. 2-lipped, upper lip largest, half bifid, obtuse Stam all united. Legume plano-compressed, stalked, many-seeded, thickened at each edge Seeds strophiolate
1532 *Scottia.* Cal. imbricated with bractes, 5-toothed, with nearly equal teeth Vexillum complicate, shorter than alæ, which are as long as carina. Stam all united, Legume stalked, compressed, thickened at each edge. Seeds 3-4, strophiolate.
1533. *Templetonia* Cal. ebracteate, with 5 nearly equal teeth. Carina oblong. Stamens all united, with uniform anthers Legume pedicellate, plano-compressed, many-seeded Seeds strophiolate
1534 *Goodia* Cal with 2 nearly equal lips, upper half bifid, acute Vexillum unfurled, large. Stamens all united Legume stalked, compressed, about 2-seeded Seeds strophiolate
1535 *Loddigesia* Vexillum much shorter than alæ or carina.
1536 *Hovea* Cal bilabiate, the upper lip half bifid, retuse Stamens all united. Carina blunt. Legume sessile, roundish, ventricose, 2-seeded Seeds strophiolate
1537 *Spartium.* Stigma longitudinal, villous above Filaments adhering to ovary. Cal lengthened at the base
1538. *Genista* Cal 2-lipped. upper one with 2, lower one with 3 teeth Vexillum bent backwards from the rest of the flower.
1539 *Lebeckia.* Cal 5-parted, with acute segments and rounded recesses Legume cylindrical, many-seeded
1540. *Ulex* Cal of 2 leaves, with a small scale at the base on each side Legume turgid, scarcely longer than the calyx
1541. *Ononis* Cal. 5-cleft, its divisions linear. Vexillum striated Legume turgid, sessile Filaments in one undivided set.
1542 *Anthyllis.* Cal inflated, 5-toothed, inclosing the small roundish 1-3-seeded legume
1543. *Arachis* Cal 2-lipped. Cor. resupinate Filaments united Legume gibbous, torulose, veiny, coriaceous.
1544. *Lupinus* Cal 2-lipped Anthers, 5 oblong, 5 round. Legume coriaceous, torulose, compressed.
1545. *Amorpha* Cal. campanulate, 5-fid. Vexillum ovate, concave Alæ O. Carina O Legume 2-seeded, falcate.
1546 *Abrus.* Cal. obsoletely 4-lobed, the upper broader Filaments 9, united at base, opening at back. Stigma blunt Seed spherical
1547. *Phaseolus* Carina with the stamens and style twisted spirally.
1548. *Teramnus* Carina very small, inclosed in the calyx Five alternate stamens fertile. Stigma sessile, capitate.
1549. *Carpopogon.* Vexillum not callous Flowers capitate Pods short, broad, 1-seeded
1550. *Dolichos* Vexillum with two calli at base, parallel, oblong, compressing the wings beneath.
1551 *Stizolobium* Cal campanulate, 2-lipped upper lip entire, erect, lower trifid, with the middle segment longest Vexillum ascending Alæ dolabriform, lunate at base, the length of carina. Anthers 2-formed hairy Legume torose, 1-celled, with partitions Seeds round, with a crested hilum.
1552 *Glycine.* Cal 2-lipped Carina pushing back the vexillum with its end.
1553 *Kennedia* Cal 2-lipped upper emarginate, lower trifid, equal. Vexillum reflexed, recurved. Alæ pressed to the carina. Carina remote. Stigma blunt. Legume oblong
1554 *Cytisus* Cal 4-fid, larger than cor. upper segment bifid at end, or emarginate, lower very large. Cor persistent Legume about 2-seeded
1555 *Galactia* Cal 4-toothed, with 2 bractes. Petals all oblong; the vexillum broadest and incumbent upon the others Stigma obtuse Legume round Seeds roundish.
1556. *Clitoria* Cor resupinate, with a large spreading vexillum overshadowing the wings
1557 *Orobus* Style linear, cylindrical, downy above Cal obtuse at the base, its upper segments deeper and shorter
1558 *Lathyrus.* Style plane, downy above, broader upwards Cal with its two upper segments shortest.
1559 *Ochrus* Cal with the two upper segments conniving Vexillum with two teeth at the sides. Style flat, villous above Legume having a membranous wing upon the seed-bearing suture
1560 *Pisum* Style triangular, keeled above, downy Two upper segments of calyx shorter than the rest.
1561 *Vicia* Style bearded beneath the stigma.
1562 *Ervum* Stigma capitate, hairy all over on the outside
1563 *Ervilia* Like Vicia, but the ovary is plaited in folds.
1564 *Cicer.* Cal 5-parted, length of cor, four upper segments incumbent on the vexillum. Legume turgid, 2-seeded
1565. *Isparta.* Cal 5-fid, with the lower segment long Ala 2-lobed below. Three teeth of the larger stamen shorter than the rest Legume ovate.
1566 *Cytisus* Cal 2-labiate, 2-3 Legume attenuated at base
1567 *Mullera* Cal. 4-toothed. Loment moniliform, with fleshy 1-seeded globules cohering by a thread.
1568 *Robinia.* Cal 4-fid; upper segment 2-parted. Legume gibbous, long Leaves unequally pinnate
1569 *Caragana.* Cal. subcampanulate Stigma smooth, truncate Legume cylindrical Leaves abruptly pinnated.
1570 *Swainsonia.* Cal 5-toothed Vexillum unfurled, larger than the blunt carina. Stigma terminal. Style bearded lengthwise in front, not bearded at back Legume turgid, not bladdery
1571 *Sutherlandia* Cal 5-toothed Vexillum without callosities, folded back at edge, shorter than oblong carina Stigma terminal. Style with a longitudinal beard behind, a transverse one before. Legume inflated, scarious
1572 *Lessertia.* Cal. half 5-fid. Vexillum unfurled Carina blunt. Stigma capitate Style bearded transversely at end in front, beardless behind. Legume scarious without valves (compressed or inflated)
1573 *Colutea* Cal. 5-toothed Vexillum with two callosities, unfurled, larger than the blunt carina. Stigma lateral under the hooked end of the style, which is longitudinally bearded behind. Legume inflated, scarious.
1574. *Glycyrrhiza* Cal. bilabiate, 3-1. Legume ovate, compressed.
1575. *Laquorstia.* Cal. tubular, equal, 5-parted. Vexillum erect, reflexed at sides. Alæ spreading Carina bifid Legume oblong, smooth, 3-4-seeded.

1576. *Coronilla.* Cal. 2-lipped, 2-3. Upper teeth connate. Vexillum scarcely longer than alæ. Loment round, jointed, straight.
1577. *Hippocrepis.* Loment compressed, with many notches on one edge, curved.
1578 *Ornithopus.* Legume jointed, curved, cylindrical.
1579 *Scorpiurus.* Loment intercepted by divisions, revolute, round.
1580. *Smithia* Stamens divided into two equal bundles. Legume jointed, plaited, included in the bifid calyx.
1581 *Sesbania.* Cal. 5-toothed. Legume long (round or linear), 2-valved, many-celled, with transverse partitions.
1582. *Æschynomene* Stamens divided into two equal bundles Legume jointed, straight, exserted. Cal. 2-parted, with toothed lips
1583 *Stylosanthes.* Cal tubular, very long, bearing the corolla. Ovarium below the corolla. Loment one or two-jointed, hooked
1584 *Hallia* Cal. 5-parted, regular Legume 1-seeded, 2-valved.
1585 *Lespedeza.* Cal 5-parted, nearly equal. Carina transversely blunt. Legume lenticular, unarmed, 1-seeded.
1586 *Flemingia.* Cal. 5-fid Vexillum striated. Legume sessile, oval, turgid, 2-valved, 2-seeded. Seeds spherical
1587 *Zornia* Cal campanulate, 2-lipped. Cor. inferior. Vexillum cordate, revolute. Anthers alternately oblong and round. Legume jointed, hispid
1588 *Hedysarum.* Cal 5-fid Carina transversely blunt Loment with 1-seeded compressed joints.
1589. *Indigofera.* Cal spreading Carina with a spreading subulate spur on each side.
1590. *Tephrosia.* Cal. with subulate nearly equal teeth Stamens monadelphous. Legume compressed, subcoriaceous.

History, Use, Propagation, Culture,

1500 *Monnieria* In memory of Monsieur Le Monnier, professor of botany in the garden of plants at Paris. He published, in 1745, "Observations sur les Plantes dangereuses des Pyrénées et du Roussillon"
1501 *Petalostemum.* From πεταλον, a petal, and στημων, a stamen; in allusion to the union of these two parts into a tube.
1502 *Corydalis* Κορυδαλις is an ancient Greek name for the Fumitory, from which genus this has been separated. Pretty little plants, well adapted for rock-work or growing on pots. They are easily cultivated and increased.

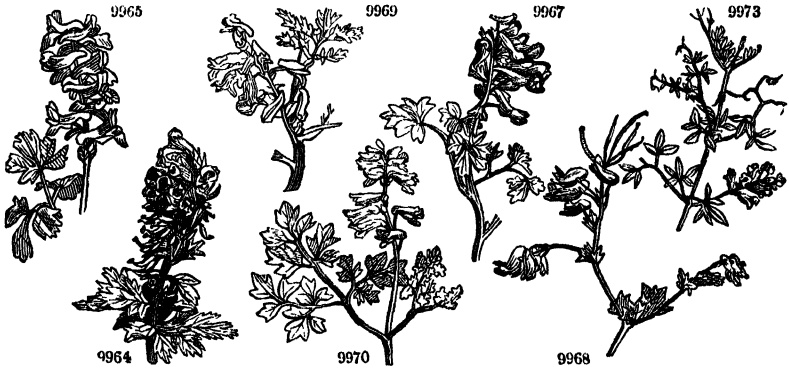
1591 *Galega.* Cal. with subulate nearly equal teeth. Legume with oblique streaks between the seeds.
1592. *Phaca.* Cal. 5-toothed, two upper teeth most distant Legume half 2-celled, inflated.
1593 *Oxytropis.* Carina ending in a mucro Legume 2-celled or half-2-celled, with the upper suture turned inwards.
1594. *Astragalus.* Legume 2-celled, more or less gibbous, with the lower suture turned inwards. Carina blunt.
1595. *Biserrula.* Legume 2-colled, flat, with a contrary dissepiment serrated on each edge
1596. *Dalea* Alæ and carina adhering to the column of stamens Stamens 5-10, united, without a separate filament Legume 1-seeded
1597 *Psoralea.* Cal the length of pod Stamens diadelphous Legume 1-seeded, subrostrate, valveless
1598 *Melilotus.* Cal. tubular, 5-toothed Carina simple, shorter than alæ and vexillum. Legume longer than calyx, rugose.
1599 *Lupinaster* Cal campanulate, 5-toothed, with setaceous teeth Stigma uncinate. Legume not knotted, round, many-seeded
1600 *Trifolium.* Legume (in general) shorter than the cal, 1 or many-seeded, indehiscent, deciduous. Flowers more or less capitate
1601. *Lotus* Legume cylindrical, straight. Alæ of the cor cohering by their upper edge. Filaments dilated upwards.
1602. *Tetragonolobus* The characters of Lotus, but the pod square with 4 wings
1603. *Trigonella* Vexillum and alæ nearly equal, spreading, in the form of a tripetalous corolla
1604 *Dorycnium.* Cal. 5-toothed, 2-lipped Filaments subulate Stigma capitate Legume turgid, 1 or 2-seeded
1605. *Medicago* Legume falcate or spirally twisted, compressed, membranaceous.
1606. *Hymenocarpus.* Like Medicago, but the legumes reniform winged at edge

---

PENTANDRIA.

9959 Stem dichotomous, Leaves ternate, Spike bifid

9960 Spike cylindrical stalked, Bractes longer than flower, Leaves in 3 pairs lanceolate
9961 Spike cylindrical stalked, Bractes subulate length of calyx, Leaflets lanceolate
9962 Spike cylindrical stalked, Bractes nearly as long as calyx, Leaves in 2 pairs linear
9963 Heads with a scaly involucre, Calyxes plumose, Leaflets linear pointless



HEXANDRIA.

9964 Stem erect simple without scales, Leaves bipinnate, Lobes cuneate cut at end, Bractes acute
9965 Stem simple without scales, Lvs 2 biternate, Segm cuneate multifid, Bractes ovate entire, Roots hollow
9966 Stem subsimple erect with scales below the lowest leaf, Leaves 3-4-stalked biternate, Segments obl. blunt
9967 Stem subsimple erect with scales below the lowest leaf, Lvs 3-4-stalk bitern cut, Segm cuneate or oblong
9968 Stem erect branched, Leaves glaucous decompound, Segm stalked cuneate trifid, Pods linear
9969 Stem branched diffuse, Leaves glaucous bipinnate, Lobes obl linear, Bractes lanceol linear acuminate
9970 Pods roundish shorter than peduncle, Stems angular, Bractes minute, Spur very short and round
9971 Stem erect somewhat branched scarcely longer than radical lvs Lvs on long stalks 3-cut, Raceme few-fl
9972 Stem branched diffuse, Lvs bipinnate, Segm obov cuneate trifid, Pods hn scarcely longer than pedicel
9973 Stem branched climbing, Leaves bipinnate, Petioles cirrhose, Segm oval entire

9974 The only species

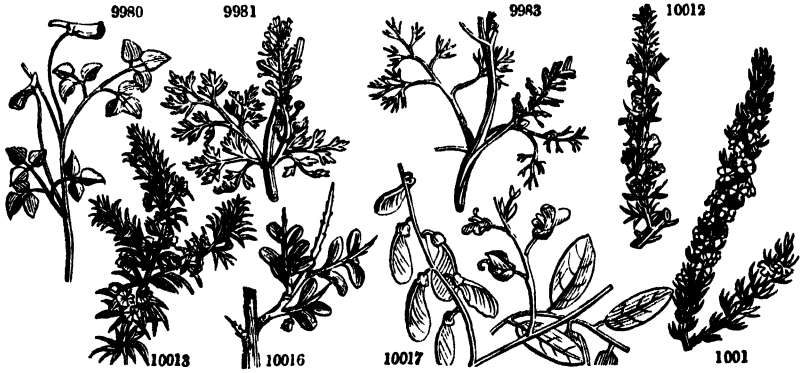
9976 Spurs 2 incurved blunt, Scape naked, Raceme compound, Stigma with 2 angles
9977 Spurs 2 incurved blunt, Scape naked, Raceme compound, Stigma with 4 angles
9978 Spurs 2 short blunt, Scape naked simple few-fl Leaves multifid

9979 The only species — Fumaria fungosa, *Hort*

and Miscellaneous Particulars.

1503 *Cystiscapnos* From κυστις, a bladder, and καπνος, fumitory. A genus divided from Fumaria on account of its bladdery fruit



1504 *Diclytra* So named by Borckhausen, a German botanist, on account of the two spurs or pouches of the flower. Handsome herbaceous plants, frequently cultivated among choice collections of rare flowers Their roots are impatient of cold and wet, and should therefore be planted in a warm dry border well exposed to the southern sun.

1505 *Adlumia* A name unexplained by its author, M. Rafinesque Schmalz A tall climbing annual plant of little beauty in its flowers, but covering a large space in the course of a summer.

History, Use, Propagation, Culture,

1506 *Sarcocapnos* From σαρξ, flesh, and καπνος, fumitory So named by Decandolle on account of the fleshy substance of the leaves of the plants contrasted with those of other allied genera.

1507. *Fumaria* From *fumus*, smoke, in allusion to the disagreeable smell of the plant. The French, with the same meaning, call it *Fumeterre*, whence our English word *Fumitory* The species are handsome weeds F officinalis was formerly considered a valuable antiscorbutic, and much used in obstructions of the viscera

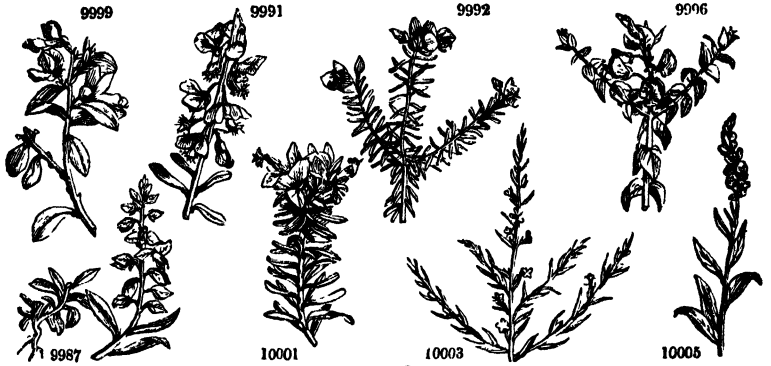
1508. *Polygala* From πολυ, much, and γαλα, milk. Dioscorides says, that the plant was believed to excite the lacteal secretions in women The species are handsome free-flowering plants. The greenhouse kinds are highly ornamental, and some of them continue in bloom all the winter: P. stipulacea all the year They grow freely in sandy loam, or loam and peat, and are readily increased by cuttings of the young wood, in sand, under a bell-glass

P vulgaris was thought to possess something of the properties of P Senega. Sir J E. Smith found that an infusion of the herb taken in a morning, fasting, about a quarter of a pint daily, promoted expectoration, and was good in a catarrhous cough He tried it at Montpelier by the advice of Professor Gouan with success, and has since known it useful. Foreign writers celebrate it as a grateful and nutritious food for cattle. According to the Swedish experiments, kine, sheep, and goats eat it, but swine refuse it.

P. Senega has a woody, branched, contorted root,-about half an inch thick, and covered with ash-colored

9980 Leaves with a branched stalk triternate, Segments ovate angular

9981 Pods round retuse, Pedicels of fruit erect twice as long as bractes, Racemes lax
9982 Pods globose, Pedicels of fruit recurved longer than bract, Racemes oblong
9983 Pods globose with a little point, Pedicels of fruit erect longer than bract
9984 Pods compressed oval smooth, Raceme spiked, Pedicels much shorter than bract



OCTANDRIA.

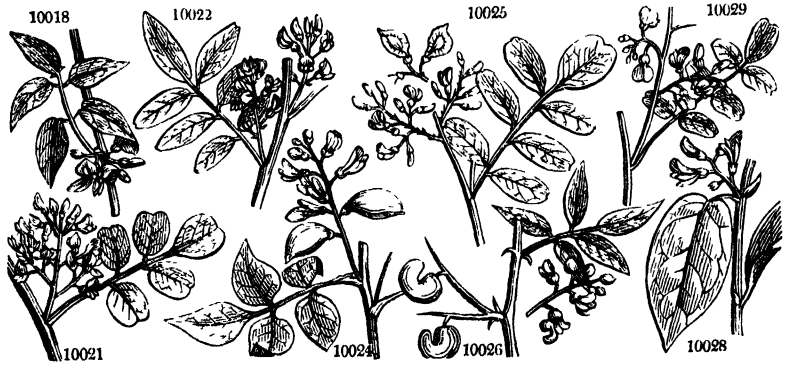
10014 Fl beardless lateral, Leaves in threes linear acute
10015 Fl beardless sessile, Leaves round mucronate very close

10016 Leaves obovate or oval, Branches short spiny

10017 Branches a little downy, Leaves oval-obl acute, Racemes lateral

and Miscellaneous Particulars.

bark It is inodorous, the taste is at first sweetish and nauseous, but after being chewed for less than a minute, becomes pungent and hot, producing a very peculiar tingling sensation in the fauces. Medically, it is considered stimulating, expectorant, and diuretic, and in large doses emetic and cathartic · it increases absorption, and consequently augments the natural excretions, particularly that of urine, and frequently occasions a copious ptyalism It was introduced to the notice of physicians by Dr. Tennant, who, having discovered that it was the antidote employed by the Senegare Indians against the bite of the rattle-snake, and reasoning from the effects of the poison, and of the remedy in removing these, was induced to try it in pneumonic affections, and found it useful On account of its stimulant properties, however, it can be employed in these complaints only after the resolution of the inflammation by bleeding and evacuations. It proves more directly useful in humoral asthma, chronic catarrh, and some kinds of dropsy. (*Thomson's London Dispensatory*, p 450)



1509 *Murallia* Named after John Von Muralt, a Swiss botanist, who lived in the commencement of the eighteenth century. Handsome bushes, of easy cultivation in a greenhouse, or even in a good pit

1510 *Mundia.* So named, in allusion, we presume, to the neatness (*munditia*) of its appearance No explanation of the word is given by its author Pretty little Cape bushes, easily cultivated in a good pit.

1511. *Securidaca* From *securis*, a hatchet, in allusion to the form of the end of the pod. It grows freely in light loam, or loam and peat; and cuttings root in sand covered with a glass.

History, Use, Propagation, Culture,

1519 *Nissolia* In honor of William Nissole, an industrious French botanist He was a member of the academy of Montpellier, and author of some papers in its Transactions. He was born in 1647, and died in 1735 Cuttings root in sand, but not very readily

1513 *Dalbergia* Nicholas Dalberg was surgeon in ordinary to the king of Sweden, and published in 1755 a work upon the Metamorphoses of Plants Another Dalberg, a pupil of Linnæus, travelled in Dutch Guiana, whence he communicated specimens to his preceptor Ripened cuttings root in sand

1514. *Pongamia* An alteration of the vernacular name of the plant in India

1515 *Pterocarpus* From πτερον, a wing, and καρπος, fruit Its pods have membranous wings P santalinus is a lofty tree, with alternate branches, and a bark resembling that of the common alder, it yields the true officinal red saunders wood, first detected by Kœnig in India It is brought home in billets, which are very heavy, and sink in water Red saunders wood has an aromatic odor, and is nearly insipid It is extremely hard, of a fine grain, takes a high polish, and a bright garnet red color, which deepens on exposure to the air. It yields its coloring matter, which appears to be of a resinous nature, to ether and alcohol, but not to water. (*Thomson's London Dispensatory*, 458)

The sap yields one sort of Sanguis draconis Many of the red Indian woods trasude a blood red juice through the clefts of the bark, which hardens into a red resin, not differing from Sanguis draconis, which, therefore, is collected from several trees, and from this among others (*Linn Suppl*) This drug, however, is chiefly obtained from the P Draco, and the fruit of Calamus Rotang.

In our stoves these plants thrive in light loamy soil, and cuttings, with their leaves untouched, will root in sand under a common hand-glass

1516 *Ecastaphyllum* From εκαστος, every one, and φυλλον, a leaf, that is to say, a leaf which is always simple, and not compounded of several others, as those of neighbouring genera

1517. *Geoffroya* In honor of Etienne Francois Geoffroi, Memb Acad Par, Professor of botany at the Jardin du Roi, and a foreign member of the Royal Society of London He was the author of several medical botanical works, especially of a Materia Medica He was born in 1672, and died in 1731 A tree, branchy at top, with a smooth grey bark and pinnate leaves, and, what is remarkable in papilionaceous plants, a drupe for a fruit.

DECANDRIA.

10018 Stem shrubby twining, Leaves pinnated, Leaflets ovate acute smoothish
10019 Leaves pinnated, Leaflets ovate-oblong emarginate
10020 Leaves ternate and quinate, Leaflets oval acuminate smooth, Fl racemose

10021 Leaves pinnated, Leaflets roundish emarginate, Fruit lanceolate

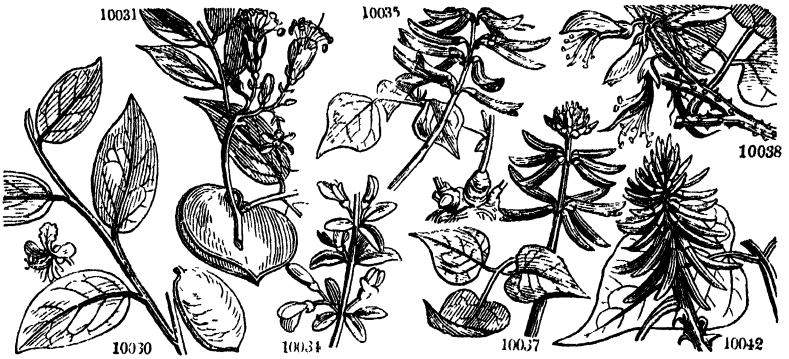
10025 Leaves pinnated, Leaflets elliptical emarginate, Stipules none, Panicle termin
10026 Leaves pinnated, Spines stipulary, Fruit lunate
10027 Leaves ternate roundish blunt quite smooth, Petals crenate wavy

10028 Leaves simple cordate-ovate downy beneath



10029 Unarmed, Leaflets ovate-lanceolate

10030 Leaves alternate, Raceme terminal

10031 Leaves pinnated, Flowers smooth

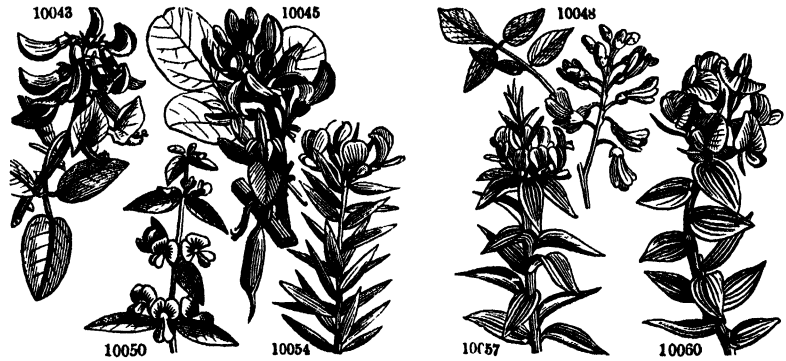
10032 Unarmed, Leaves simple stalked alternate subcordate ovate, Racemes compound axillary and lateral
10033 Leaves pinnated, Leaflets ovate acuminate, Stem arboreous
10034 Spiny, Leaves subsessile aggregate obovate oblong, Peduncles 2-flowered

10035 Leaves ternate rhomboid smooth, Stem herbaceous unarmed, Calyxes truncate
10036 Leaves ternate smooth, Stem arboreous prickly, Calyxes campanulate truncate
10037 Leaves ternate unarmed, Stem arboreous prickly, Calyxes truncate 5-toothed
10038 Leaves ternate unarmed, Stem arboreous prickly, Calyxes spathaceous
10039 Leaves ternate unarmed lanceolate, Stem arboreous prickly, Calyxes bifid
10040 Leaves ternate unarmed, Leaflets blunt, Stem arboreous prickly
10041 Leaves ternate prickly, Stem arboreous prickly
10042 Leaves ternate prickly beneath, Petioles unarmed, Stem prickly

and Miscellaneous Particulars

This drupe is large, subovate, and incloses a woody nut. The bark, which has a mucilaginous sweetish taste and a disagreeable smell, was first noticed as a vermifuge by Peter Dugnid, but Dr Wright, who resided a long time at Jamaica, has communicated the fullest information concerning this tree According to him, the bark is powerfully medicinal, and its anthelmintic effects have been established at Jamaica by long experience.

1518 *Dipterix* From δις, double, and πτερυξ, a wing, in allusion to the two appendages of the calyx A tree much branched at top, with large alternate pinnate leaves, and racemes of flowers succeeded by almond-like fruits. The kernels of these are very fragrant, and are put by the Creoles into chests of clothes, in order to drive away insects, and communicate a grateful odor. They are in their own country called *Tonga*, and are the sweet-scented seed sold in shops under the corrupted name of *Tonquin* bean, for perfuming snuff and other substances. Ripened cuttings root in sand in moist heat



1519 *Parivoa*. The name of the tree in Guiana. A very handsome tree.

1520. *Amerimnum* One of the names given to the Houseleek by the Greeks It is derived from α, privative, and μεριμνα, care, because the plants require no attention It is not easy to tell why the name was applied to this genus, which has nothing in common either with the Houseleek or its ancient name. A Ebenus is common in the West Indies, and the wood is sent to Europe under the name of American Ebony Though not the true ebony, yet being of a fine greenish-brown color, and polishing well, it is much coveted by the instrument makers, and is of a very hard durable nature The flowers of Amerimnum latifolium are yellow, and smell like new hay In our stoves the species may be treated like Pterocarpus

1521 *Erythrina* From ερυθρος, red, nearly all the species being remarkable for the brilliant scarlet color of their flowers The species are small trees, prickly or unarmed, or else shrubs, sometimes almost herbaceous, leaves, as in Dolichos, ternate, stipulaceous, the petiolules jointed and awned, or glandular, very seldom simple; *flowers in fascicles from the axils, or in spikes at the end of the stem and branches, often scarlet (Jussieu).*

In our stoves they thrive well in a light loamy soil. "The best way to flower them," Sweet observes, "is to place them on a dry shelf in winter, when they have no leaves, and give them scarcely any water, when they show flower-buds, they may be plunged in a moist heat, which will make the flowers finer than they

History, Use, Propagation, Culture,

would be, if the plants stay out till they are in bloom. Cuttings taken off at a joint, and planted in sand, without being deprived of any of their leaves, strike root readily under a hand-glass in moist heat." (*Bot. Cult* 54)

1522. *Butea.* Named in honor of the late Earl of Bute, a munificent patron of botanical science. This splendid genus, though of free growth and easy propagation, is yet rare in British collections. From B frondosa is obtained the *Gum lac* of commerce Infusions of the flowers dye cotton cloth, previously impregnated with a solution of alum, or of alum and tartar, of a beautiful yellow color The plant grows in loam and peat, and "cuttings should be taken off at a joint, and planted in a pot of sand, without being deprived of any of their leaves: one pot is enough under a hand-glass, as the leaves take up much room, and, if too confined, are apt to damp off They should be plunged in a moist heat" (*Bot Cult* 30)

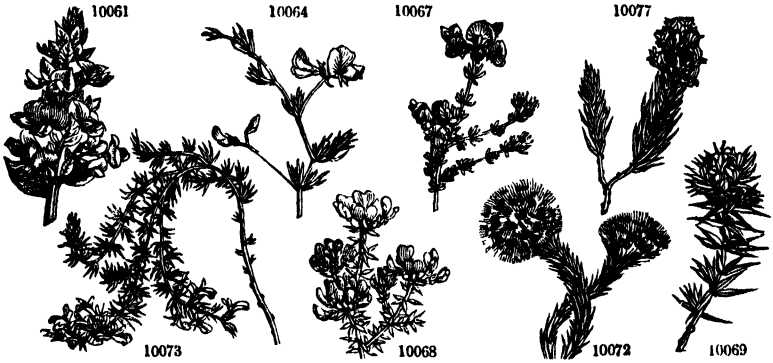
1523. *Viborgia*, usually written *Wiborgia*, received its name after M. Eric Viborg, a learned and acute Danish botanist, author of several botanical treatises in his own language in the end of the eighteenth century. The species, like those of the four preceding genera, may be treated as Scottia.

1524 *Piscidia.* From *piscis*, a fish, the inhabitants of America use the bark as a fish poison This tree has spreading branches and pinnate leaves, and is very common in Jamaica, where it is reckoned one of the best timber-trees in the island. The wood is very hard and resinous, and lasts almost equally in or out of water It is of a light-brown color, coarse, cross-grained, and heavy. (*Browne.*) It makes excellent piles for wharfs The stakes soon form a good live fence The bark of the trunk is very astringent, a decoction of it stops the immoderate discharge of ulcers, especially when it is combined with the mangrove bark, it cures the mange in dogs, and would probably answer well for tanning leather (*Long*, 824) The bark of the root is used for the same purposes and with the same effects as the leaves and branches of Surinam poison, it is pounded and mixed with the water in some deep and convenient part of a river or creek, when ce it may spread itself,

10043 Leaves ternate, Petioles prickly glandular, Stem arboreous unarmed
10044 Leaves ternate oblong oval blunt

10045 Branches downy, Leaflets roundish emarginate
10046 Branches smooth, Leaflets obovate roundish blunt

10047 Leaflets and twiggy branches pubescent



10048 Leaves unequally pinnate, Leaflets ovate

10049 Leaves cordate ovate, Ovary hairy
10050 Leaves lanceolate ovate, Ovary smooth
10051 Leaves deltoid or hastate with spiny angles

10052 Leaves sublinear acute villous beneath, Heads terminal
10053 Leaves lanceolate 3-nerved entire
10054 Leaves lanceolate many-nerved entire
10055 Leaves amplexicaul entire netted
10056 Leaves amplexicaul wavy with a reflexed mucro
10057 Leaves cordate many-nerved entire
10058 Leaves cordate many-nerved toothletted
10059 Leaves ovate cordate acuminate pungent, Stem hirsute
10060 Leaves rigid pointed pungent oblong dense

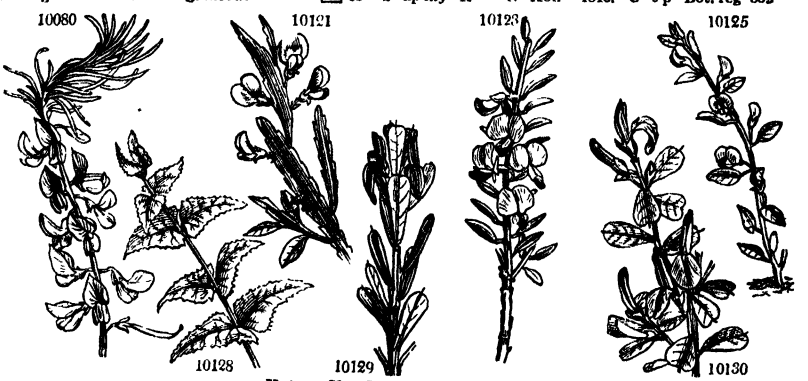
10061 Leaves ovate smooth, Branches angular, Peduncles 3 lateral 1-flowered

10062 Leaves fascicled 3-angular mucronate stiff hairy, Heads hairy
10063 Leaves fascicled filiform silvery blunt, Racemes leafy, Flowers not hairy
10064 Leaves fascicled subulate smooth, Peduncle filiform twice as long as leaf
10065 Leaves fascicled filiform blunt hairy, Flowers somewhat racemose
10066 Leaves fascicled 3-cornered mucronate hairy, Flowers lateral
10067 Leaves fascicled fleshy round smooth, Fl lateral and terminal, Flowers smooth
10068 Leaves fascicled fleshy round smooth setaceous at end, Fl capitate terminal
10069 Leaves fascicled scabrous somewhat hairy, Heads terminal
10070 Leaves fascicled filiform mucronate smooth, Flowers lateral
10071 Leaves fascicled 3-cornered mucronate smooth
10072 Leaves linear downy imbricated, Heads terminal crowded
10073 Leaves fascicled filiform lax hairy, Heads hairy
10074 Leaves quinate sessile, Peduncles 1-flowered
10075 Leaves ternate and fascicled ovate silky, Heads downy, Stem dichotomous
10076 Leaves ternate and fascicled filiform silky, Fl somewhat lateral, Vexillum naked
10077 Leaves three 3-cornered smooth, Spikes ovate
10078 Leaves ternate, Leaflets blunt, Branches spiny
10079 Leaves fascicled fleshy round smooth, Flowers lateral without bractes, Branches twiggy

and Miscellaneous Particulars.

in a few minutes the fish that lie hid under the rocks or banks rise to the surface, where they float as if they were dead, most of the large ones recover after a time, but the smaller fry are destroyed The eel is not intoxicated with common doses, though it is affected very sensibly, for the moment the particles spread where it lies, it moves off with great agility Jacquin observes that this quality of intoxicating fish is found in many other American plants

It is a very free grower in our stoves, but is seldom allowed to grow large enough to flower Cuttings root in sand under a hand-glass



1525. *Platylobium.* From πλατυς, broad, and λοβος, a pod, in allusion to the form of the pod. Handsome free-flowering plants, which grow in sandy loam and peat, and are increased by cuttings in sand under a hand-glass, or by seeds.

1526. *Borbonia* In memory of Gaston Bourbon, Duke of Orleans, son of Henry IV of France, a great lover and patron of botany See Gastonia. Shrubs of easy culture and propagation

1527 *Rafnia* Named, according to Sir James Smith, after Mr C. G Rafn of Copenhagen, author of a Flora of Denmark and Holstein, published in 1796 and 1800, in two octavo volumes. A genus of Cape plants, separated from the Linnean Crotalaria and Liparia.

1528 *Aspalathus* A native of the island *Aspalathus* on the coast of Lycia. It was a common practice with the ancients to fix the names of places upon certain plants, as Cytisus, Lycium, and others It is not certain what plant the ancients intended by their Aspalathus Shrubs and under-shrubs, with fasciculate linear leaves, and yellow flowers, all of which grow freely in a mixture of sandy loam and peat, and young cuttings, planted in sand under bell-glasses will strike root freely, if the glasses are wiped occasionally, otherwise they are liable to damp off Some species ripen seeds freely, by which young plants are readily produced (*Bot. Cult* 140.)

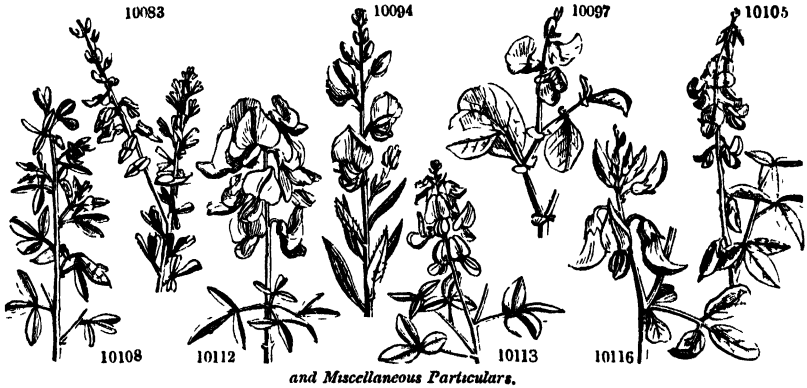
History, Use, Propagation, Culture,

1529. *Sarcophyllum* From σαρξ, flesh, and φυλλον, a leaf The leaves are thick and fleshy. A somewhat succulent plant, easily injured by over-watering, but otherwise not difficult to preserve or increase

1530 *Crotalaria* Κροταλον was the name of a noisy Greek musical instrument, similar to the cymbals of the present day The pods of this genus are inflated, and rattle, when shaken, in a similar manner. The species are all of easy culture, mostly free-flowerers; but they are shabby plants under cultivation, and possess no good quality which can render them objects of interest or beauty

1531. *Bossiæa.* Named by Ventenat, after M Bossieu-Lamartinière, who accompanied the unfortunate La Pérouse in his voyage round the world This beautiful genus, according to Sweet, "thrives best in an equal mixture of sandy loam and peat, if not very sandy, some sand must be added to it to have the plants in health. The pots must be well drained with broken potsherds, as nothing injures them more than too much



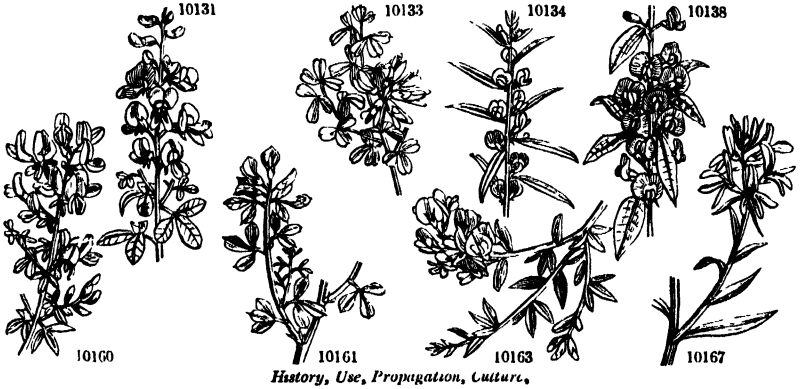
10080 The only species

10081 Leaves simple obl. lanceolate, Stipules lanceolate acuminate decurrent, Racemes opposite the leaves
10082 Leaves simple lanc. elipt. blunt downy beneath, Racemes opposite the leaves
10083 Leaves very small ternate glaucous, Racemes few-flowered, Vexillum reflexed
10084 Leaves simple lanc villous, Upper stipules lanc. decurrent, Racemes opposite the leaves, Cal villous
10085 Branches winged upwards, Lower leaves obl upper lanc acute hairy, Racemes lateral
10086 Leaves simple lin lanc acute villous beneath, Flowers and pods inclosed in hairy calyx
10087 Leaves simple long-lanc Pods downy, Raceme terminal, Stem square
10088 Leaves obl lanceolate silky beneath, Fl racemose, Bractes linear much shorter than pedicel
10089 Leaves simple lanc Upper stipules decurrent with 2 short teeth, Racemes opposite the leaves
10090 Leaves lanceolate subsessile. Lower lip of cal 3-parted beyond the middle, Stem virgate simple
10091 Leaves simple lanc subsessile, Pods smooth, Raceme terminal, Stem furrowed
10092 Leaves lanceolate blunt hairy, Fl terminal, Calyx hairy as long as corolla
10093 Leaves lanceolate, Raceme terminal, Cal very villous as long as corolla
10094 Leaves simple ov. lanceolate silky ciliated, Standard large erect pointed
10095 Leaves simple lanc beneath, Pods silky, Raceme terminal, Stem furrowed
10096 Leaves simple obl cuneiform retuse, Raceme terminal
10097 Leaves simple ovate retuse, Stipules lunate declinate, Raceme term Branches square
10098 Leaflets 3 oval acute, Hairs shining scattered, Racemes opposite the leaves
10099 Leaflets 3 oval blunt with scattered hairs, Raceme terminal long, Keel shorter than vexillum
10100 Leaves simple obovate oblong silky on each side, Pod 4-seeded length of calyx
10101 Stems round striated, Leaves oval emarginate mucronate, Stipules lunate amplexicaul
10102 Leaves simple lin-lanceolate blunt hairy, Pedunc terminal subsolitary, Stem branched diffuse
10103 Leaves simple obl blunt hairy, Stems prostrate herbaceous, Pedunc 2-3-fl axillary
10104 Leaflets 3 oblong blunt mucronate with scattered hairs beneath, Raceme terminal, Calyxes silky
10105 Leaves ternate, Leaflets oval-lanc acute twice as long as villous petiole, Pods pendulous
10106 Leaves obovate cuneate silky, Racemes term Bractes and calyx colored
10107 Leaves obl blunt silky villous, Stipules linear subulate reflexed, Panic terminal bracteate
10108 Leaves ternate, Leaflets cuneiform emarginate silky beneath, Peduncles axillary solitary 1-flowered
10109 Leaves ternate ovate acuminate smooth, Stipules none, Raceme terminal, Pods stalked pendulous
10110 Leaves ternate obcordate mucronate, Flowers corymbose, Stem shrubby
10111 Leaves ternate, Leaflets obovate retuse, Racemes terminal
10112 Leaves ternate, Leaflets linear lanceolate acute half as long again as petiole downy beneath
10113 Leaves ternate on long stalks, Leaflets oval downy, Racemes axillary lax, Standard blunt
10114 Leaves ternate obl lanceolate acute silky beneath, Stipules lanceolate subulate, Pedunc axill 1-flowered
10115 Leaves ternate obovate strigose beneath, Stipules lanceol and bractes ovate reflexed, Racemes terminal
10116 Leaves ternate obovate, Stipules leaf-like stalked, Racemes terminal, Pods stalked
10117 Leaves ternate oval villous beneath, Racemes spiked, Keel downy at edge, Pods sessile hairy
10118 Leaves ternate lanceolate smooth, Racemes terminal spiked
10119 Leaves ternate lanc. hoary silky shorter than petiole, Raceme terminal
10120 Leaves quinate

10121 Branches flat linear leafless, Denticulations flower-bearing, Keel naked, Calyx smooth
10122 Branches flat linear leafless, Denticulations flower-bearing, Keel fringed, Calyx smooth
10123 Branches leafy compressed, Leaves obovate and linear flat, Pod many-celled with spongy septa
10124 Branches leafy compressed, Leaves linear with recurved edges, Pod 1-celled
10125 Branches leafy filiform, Leaves oval smooth, Stipules shorter than petiole, Pod 1-celled
10126 Branches leafy round, Stem erect much branched, Leaves ovate-lanc rough above
10127 Branches leafy spiny round, Leaves obcordate cuneiform

10128 The only species

10129 Leaves green retuse
10130 Leaves glaucous blunt



and Miscellaneous Particulars.

water. Cuttings, not too ripe, will strike root if planted in sand under a bell-glass, not too close together, as they are apt to damp, when rooted, they must be potted off in little pots and kept in a close frame, and hardened to the air by degrees." (*Bot. Cult* 151)

1532. *Scottia.* Named in memory of Robert Scott, M. D, formerly professor of botany at Dublin. A shrub found by Mr Brown upon the south-west coast of New Holland. Young cuttings root in sand under a bell-glass.

1533. *Templetonia.* Named after John Templeton, Esq., of Orange Grove, near Belfast, a gentleman to whom the editor of the English Botany was under frequent obligations for Irish plants during the progress of that work.

History, Use, Propagation, Culture,

1534 *Goodia* In memory of Peter Good, an industrious gardener employed by the Kew garden in collecting seeds in New Holland, where he died.

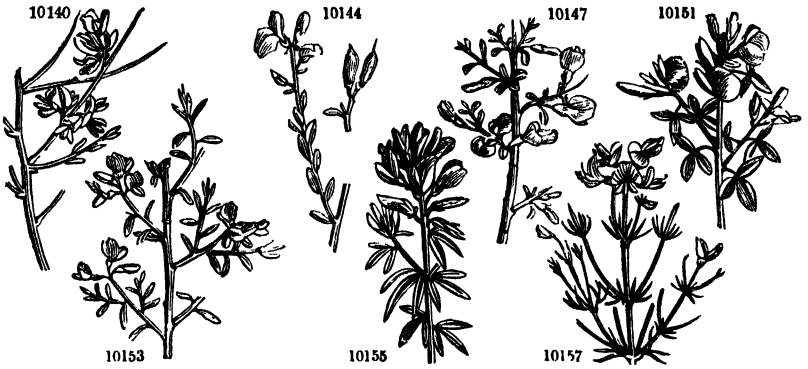
1535 *Loddigesia* Named in compliment to Mr Conrad Loddiges, a successful cultivator of plants, an assiduous collector, and a most worthy man, whose virtues are inherited by his sons

1536 *Hovea* In honor of Mr Antony Pantaleon Hove, a Polish botanist, who travelled in the Crimea and Persia, whence many plants were sent to Kew garden He is still alive, and naturalized in England. Pretty plants, easily cultivated in sandy loam and peat, and rooted in sand under a hand-glass

1537. *Spartium* From *σπαρτον*, cordage; the earliest ropes were made of this and similar tough plants The species are shrubs thick-set with verdant flexible rush-like twigs, which are very ornamental in winter, and generally profusely covered with shewy white or yellow odoriferous and mellifluous blossoms in summer. S junceum is grown as a green food for sheep in the south of France, and there and in Spain it affords a thread from its fibres, which is sometimes wove into cloth, but more generally twisted into cordage. Bees are very fond of the flowers, as they are of those of most of the species.

S monospermum, is a very handsome shrub, remarkable for its numerous snow-white flowers Osbeck remarks, that it grows like willow-bushes along the shore of Spain, as far as the flying sands reach, where scarcely any other plant exists except the Ononis repens, or creeping Restharrow. The use of this shrub is very great in stopping the sand The leaves and young branches are delicious food for goats It converts the most barren spot into a fine odoriferous garden by its flowers, which continue a long time It serves to shelter hogs and goats against the scorching heat of the sun The twigs are used for tying bundles, and all kinds of herbs that are brought to market are fastened together with them Forskahl found it in Arabia; and Desfontaines in Barbary, on the sandy coast. The Spaniards call it *Retamas*, from the Arabic name *Rætam.*

10131 Leaflets obovate and calyxes smooth, Pod varicose
10132 Leaflets obovate cuneate and calyxes downy, Pod smooth



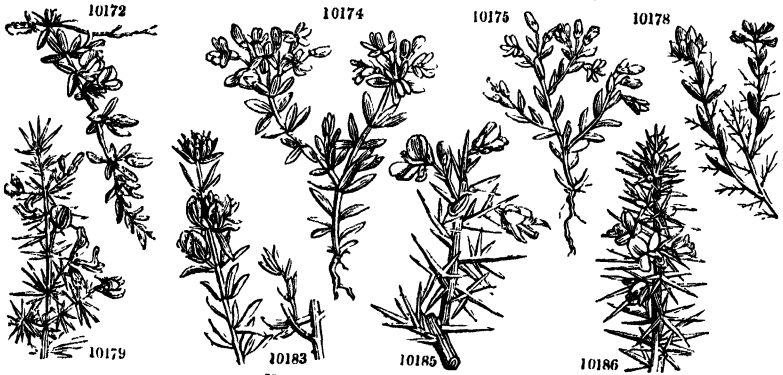
10133 The only species

10134 Leaves linear hairy beneath, Pods smooth
10135 Leaves long linear, beneath veiny, Pods downy
10136 Branches twiggy, Leaves lanc mucronate downy beneath, Fl. axill twin
10137 Leaves elliptic oblong
10138 Leaves lanc somewhat rhomboid blunt at end mucronate, Peduncles axillary many-flowered

10139 Branches opposite round flowering at end, Leaves lanceolate

10140 Branches round striated, Racemes lateral few-fl Flowers subaggregate, Leaves lanceolate silky
10141 Branches round striated, Racemes lateral many-fl Flowers remote, Leaves lanc sessile a little hairy
10142 Branches round striated, Fl solitary axillary, Pods villous, Leaves lanceolate hairy
10143 Branches round striated very close, Fl terminal racemose, Vexillum smooth, Leaves lanc silky
10144 Branches round striated, Fl axill solitary subracemose, Standard and keel downy, Lvs obl lanc. silky
10145 Branches round striated, Fl axillary solitary, Leaves lanc silky subsessile
10146 Branches round striated, Fl term capitate, Leaves lin lanc silky
10147 Branches round striated spreading spiny, Pedunc axill many-fl Leaves obl acute silky
10148 Leaves lanc silky beneath, Corolla silky, Branches erect round
10149 Leaves ternate and simple silky, Twigs straight striated flowering on all sides
10150 Leaves solitary and ternate linear lanceolate hoary, Branches hexangular flowering at the ends
10151 Leaves ternate stalked obovate, Branches round striated, Lateral flowers twin nodding
10152 Branches angular, Leaves simple lanceolate silky beneath, Fl racemose, Pods hairy
10153 Branches round with ten furrows, Flowers axillary solitary downy
10154 Leaves ternate lanc hairy stalked, Fl lateral fascicled, Pods smooth, Branches round striated
10155 Leaves ternate sessile linear silky beneath, Raceme terminal, Branches round furrowed
10156 Leaves ternate and solitary oblong, Fl axillary, Pods hairy at edge, Branches angular
10157 Leaves ternate linear, Petioles dilated persistent, Racemes capitate term Branches angul opp clustered
10158 Leaves ternate and simple oblong mucronate, Raceme terminal, Branches striated round spiny
10159 Leaves ternate obovate, Peduncles axillary, Cal. and pods smooth, Branches angular spiny

10160 Leaves tern obl downy beneath with spreading hairs, Pedunc many-fl terminal, Branches angular
10161 Leaves ternate obovate downy with closely pressed hairs, Pedunc many-fl terminal, Branches angular
10162 Leaves ternate obl smooth, Racemes terminal, Cal and pods glandular viscid, Branches round striated
10163 Leaves ternate upper simple, Branches triquetrous procumbent
10164 Branches 2-edged membranous jointed, Leaves ovate lanceolate
10165 Leaves lanceolate mucronate smooth, Branches 3-cornered ascending, Pods smooth
10166 Leaves lanceolate smooth, Branches round striated erect, Pods smooth
10167 Leaves lanceolate smooth, Branches equal round erect
10168 Leaves oblong ovate and pods hairy, Branches round striated
10169 Quite smooth, Leaves not ciliated, Cor 5 lines long, Calyx smooth



and Miscellaneous Particulars

S scoparium, though in some places a troublesome weed in old pastures, is a very ornamental shrub in garden scenery it is also useful in agriculture, domestic economy, and medicine It is sometimes used as winter food for sheep, frequently for thatching cottages and ricks, and as litter Bees are fond of the flowers the flower-buds, just before they become yellow, are pickled in the manner of capers · the branches are said to be capable of tanning leather, and of being manufactured into coarse cloth; when tender, they are mixed with hops in brewing the old wood furnishes the cabinet-maker with a beautiful material for veneering The twigs, when bruised, smell disagreeably, which perhaps may be one reason why our broom is generally rejected by cattle (*Curtis*), but they have also a nauseous bitter taste The plant when burnt affords a tolerably pure alkaline salt Broom tops are diuretic and cathartic, the seeds are said to be emetic The effects of this plant have been very long known to the common people, and both Mead and Cullen found them useful in dropsy The usual mode of exhibiting them is in the form of decoction, made by boiling the green tops in water Speaking of this decoction, of which two table spoonfuls were given every hour till it operated by stool, Cullen says, "it seldom fails to operate both by stool and urine, and by repeated exhibition every day, or every second day, some dropsies have been cured. (*Thompson's London Dispensatory*, 514)

1338 *Genista Gen*, signifies, in Celtic, a small bush, whence also *Genet*, French The species are shrubs or undershrubs, some of them evergreen, and many with numerous flexible rush-like green twigs like the brooms. They are of easy culture and free flowerers. G. tinctoria is common in most parts of Europe, in unimproved pastures on dry gravelly soils. When cows feed on it, their milk, and the butter or cheese made from it, are said to be very bitter A bright yellow color may be prepared from the flowers, and for wool that is to be dyed green with woad, the dyers prefer it to all others. A dram and a half of the powdered seeds operates as a mild purgative. A decoction of the plant is sometimes diuretic, and therefore

History, Use, Propagation, Culture,

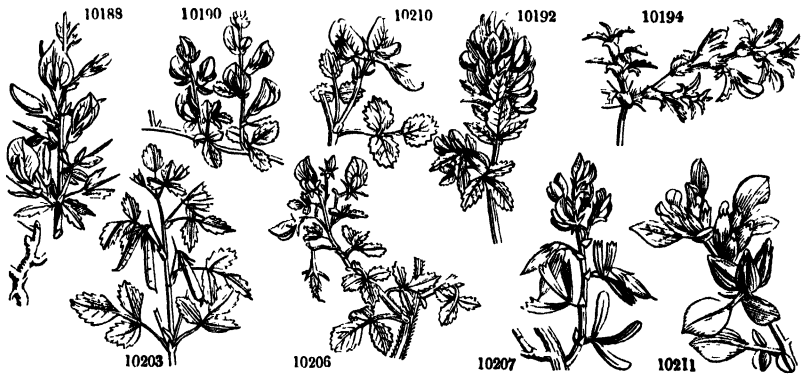
has proved serviceable in dropsical cases A salt prepared from the ashes is recommended in the same disorder.

G. *triquetra* is the handsomest hardy species it is evergreen, and produces a vast profusion of bloom freely in sand under close cover

1539. *Lebeckia* Named by Thunberg possibly in honor of some forgotten botanist Young cuttings root

1540. *Ulex.* A word of very obscure meaning De Theis derives it from *ac*, a point in Celtic. U europæus, *Jonc-marin*, Fr., is a beautiful evergreen shrub, which flowers freely, both when wild and cultivated, the greater part of the year. It abounds in some places, and there it is despised by the common people, but the greatest botanists have admired its deep green shoots and leaves, brilliant yellow flowers, and tufted picturesque shape About Petersburg, it forms one of their most valuable greenhouse plants, flowering in winter. Linnæus lamented that he could hardly preserve it alive in a greenhouse. Many parts of Germany are wholly destitute of the furze bush, insomuch that Dillenius was in a perfect extasy when he first saw our commons covered with its golden flowers And Gerard relates, that about Dantzic, Brunswick, and in Poland, there was not a branch of it growing, except some few plants and seeds that he sent, which were most curiously kept in their fairest gardens As an agricultural plant the furze has been sown in several parts of the island as hedges, but excepting where it occupies a breadth of ten or twelve feet on a raised mound, it does not last long, getting naked below. Sown on a mound the sides may be cut, and the prunings used as fuel or as green food, and the fence thus rendered close at bottom and durable. It is sown in fields, and

10170 Leaves lanceolate silky, Branches striated round, Racemes 1-sided
10171 Leaves lanceolate acute, Pedunc. axill 3 longer than leaves, Cor smooth, Branches striated round
10172 Leaves lanceolate blunt silky beneath, Pedunc. axillary as long as leaf, Cor silky, Branches angular
10173 Leaves lanceolate complicate, Pedunc. axill very short, Cor. hairy, Stem warted striated procumbent
10174 Leaves lanceolate smooth subciliate, Pedunc axillary, Cor smooth, Branches 3-cornered procumbent
10175 Leaves lanceolate silky beneath, Fl terminal somewhat racemose, Cor silky, Branches erect round
10176 Spines simple or compound, Flowering branches unarmed, Leaves oblong smooth, Racemes leafy term
10177 Spines warted compound, Fl branches unarmed, Lvs lanc hairy, Racemes term naked, Keel pubesc.
10178 Spines compound pungent, Leaves lanceolate villous, Racemes terminal subcapitate
10179 Stem leafless, Spines crossing each other
10180 Leaflets ternate obovate, Racemes short, Bractes linear under the flower



10181 Leaves simple linear filiform smooth, Flowers umbelled
10182 Leaves ternate silky, Leaves linear, Flowers racemose
10183 Leaves ternate villous, Raceme long terminal
10184 Leaves simple binate or ternate sessile lanceolate acute rough

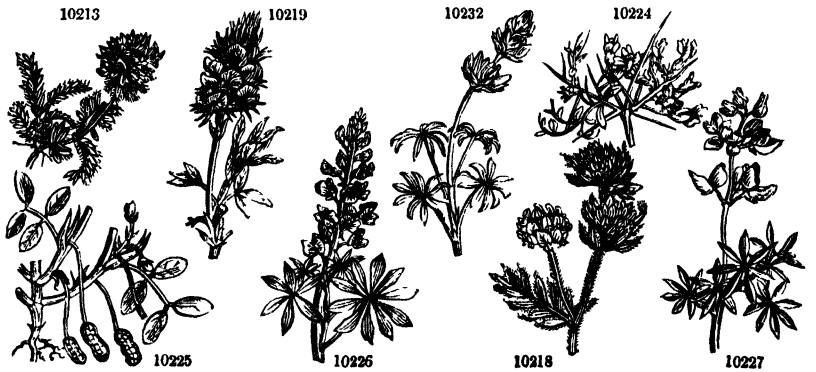
10185 Teeth of cal conniving, Bractes ovate loose
10186 Teeth of cal distant, Bractes minute appressed

10187 Fl solitary larger than leaflet, Lower leaves ternate lanceolate toothed at end, Branches spiny smooth
10188 Fl twin axillary, Lower leaves ternate lanc serrate, Branches spiny villous
10189 Fl twin, Lower leaves ternate ellipt serrate pubescent, Stem unarmed villous viscid
10190 Fl solitary axill. Lower leaves ternate roundish serrate, Branches ascending spiny villous
10191 Fl subsess lateral, Leaves ternate obl pubes. Stipules lanc toothletted, Cal scarious longer than cor.
10192 Fl sessile spiked, Bractes stipular ovate ventricose scarious imbricated
10193 Fl subsess lateral spiked, Leaves simple ovate blunt, Stipules dilated, Cal larger than smooth corolla
10194 Fl somewhat stalked axill Lvs simple obov striated serrated, Stipules ovate toothed, Stem procumbent
10195 Pedunc unarmed very short, Upper leaves simple, Stipules ovate lanc entire
10196 Racemes straight, Leaves cuneiform, Pods nodding linear recurved
10197 Leaves ternate obovate, Pedunc lateral 2-flowered
10198 Pedunc unarmed 1-fl Leaves ternate roundish crenate, Pods cernuous
10199 Pedunc unarmed 1-fl Leaves ternate cuneate, Stipules serrate, Stems prostrate
10200 Pedunc 1-fl awned, Leaves sessile ternate, Stipules sheathing toothed
10201 Pedunc 1-fl awned, Leaves tern cuneate toothed at end villous viscid, Cal larger than corolla
10202 Pedunc 1-fl awned length of leaves, Leaves simple oblong serrated viscid lower ternate
10203 Pedunc 2-fl awned shorter than petiole, Leaves tern oblong, Pods linear cernuous
10204 Pedunc 1-fl awned longer than leaf, Awns length of cor Leaves ternate lanc serrated at end
10225 Pedunc 1-fl awned longer than leaf, Leaves ternate viscid obl toothed at end
10206 Pedunc awned about 1-fl. Leaves all ternate channelled recurved wholly serrated

10207 Shrubby, Leaves tern linear fleshy 3-toothed, Pedunc 2-flowered
10208 Shrubby, Leaves tern roundish wavy toothed viscid, Pedunc 1-flower unarmed
10209 Shrubby, Leaves sessile ternate lanceolate serrated, Stipules sheathing, Pedunc 3-flowered
10210 Shrubby, Leaves tern ovate toothed, Cal with 3 bractes, Pedunc 3-flowered

10211 Herbaceous, Leaves quaternate-pinnate, Flowers lateral
10212 Herbaceous, Leaves pinnated unequal, Head double

and Miscellaneous Particulars



allowed to grow three or four years, and then it is cut down for fuel or for heating ovens; but the most profitable application of furze, whether sown or grown wild, is that of using it as green food for cattle. For this purpose, the shoots should not be more than two years old, and they require to be passed between rollers to bruise the ligneous parts and the thorns It has been tried in this way by a number of agriculturists, and found a highly nutritive food for horses, oxen, and kine Though a hardy plant and enduring the sea breeze, yet it is frequently killed by severe winters It is never found on wet-bottomed clays, but generally on dry rocky or stony soils There is a very luxuriant variety called the Irish whin, and one with double flowers found a few years ago in Devonshire, and now in propagation by cuttings in the nurseries.

U nanus greatly resembles the common species, but is smaller in all its parts. It flowers from August to January, which renders it valuable in shrubberies as a successor to the other.

1541 *Ononis.* From ονος, an ass, because asses only feed upon so prickly a plant. O. spinosa, *Arrête boeuf*, Fr, *Rest harrow*, Eng, was formerly very troublesome in corn fields, on account of its long ligneous roots obstructing the progress of the plough, and its thorny branches the harrow: but in all properly cultivated lands the plant has disappeared. It is frequent in aboriginal pastures on dry soils, and is eaten by cows, sheep, and goats, but not freely by horses. All the species are of easy culture, and the greenhouse kinds are readily increased by young cuttings under a bell-glass in sand.

1542. *Anthyllis.* From ανθος, a flower, and ουλος, a beard. So called from the silky appearance of its heads of flowers, whence also one species is called Barba Jovis A. Vulneraria is recommended as a herbage

History, Use, Propagation, Culture,

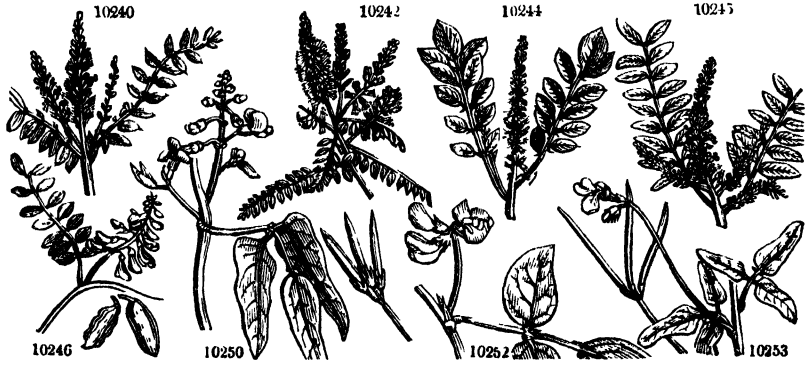
plant by some agricultural writers, as A Young, and is by others confounded with Birdsfoot trefoil (Lotus corniculata, and major), and with the Liquorice-vetch (Astragalus glycyphyllos), to which, to a cursory observer, it bears considerable resemblance Linnæus observes, that in Oeland, where the soil is a red calcareous clay, the flowers of Anthyllis vulneraria are red, but that in Gothland, where the soil is white, the flowers also are white ours are yellow

A Barba Jovis is a silvery looking bush, with white and hairy leaves, pale yellow flowers, and woolly pods Like most of the Leguminosæ, this genus seeds freely, but in default of seeds, increase may be effected by "young cuttings planted under a bell-glass in sand, which are not difficult to root the glasses must be kept wiped, or the dew is apt to make them mouldy, which destroys them" (*Bot Cult* 135)

1543. *Arachis. Aracos*, or *Aracuna*, is a name applied by Pliny to a plant which had neither stem nor leaves, but was all root. The moderns have applied it to a plant, the fruit of which is borne underground The specific name *hypogæa* (ὑπὸ γῆν, below ground), is in allusion to the curious circumstance of the pods, as they increase in size, forcing themselves into the earth, where they ripen their seeds, thence called earth-nuts. The plant is generally cultivated in the warmer parts of North and South America, but is supposed to be originally from Africa. In South Carolina the seeds are used as chocolate, in the eastern countries as almonds, and in Cochin-China they furnish an oil used for lamps, and as a substitute for oil of olives. About Paris it is raised on hotbeds and transplanted into the open garden, where it ripens its seeds, which are used as other legumes. It has also been brought to maturity in a stove in England, and proved very prolific. (See *Hort Trans.* vol. v p 372)

1544. *Lupinus* Said to be derived from *lupus*, a wolf, because this plant devours, as it were, all the fertility

10213 Herbaceous, Leaves pinnated equal, Head terminal 1-sided, Flowers oblique
10214 Herbaceous, Leaves pinnated equal silky, Spike peduncled ovate
10215 Herbaceous, Leaves pinnated unequal, Head solitary stalked, Pods hooked blunt shorter than calyx
10216 Herbaceous, Cauline leaves ternate: radical pinnate unequal trifid or simple
10217 Herbaceous, Leaves pinnated unequal, Pedunc lateral longer than leaf, Heads leafless
10218 Shrubby, Leaves pinnated equal silky, Bractes as long as globose many-flowered head
10219 Shrubby, Leaves pinnated equal and ternate villous, Flowers spiked
10220 Shrubby, Leaves pinnated · floral ternate
10221 Shrubby, Leaves ternate unequal, Calyxes woolly lateral
10222 Shrubby, Leaves ternate linear-cuneate somewhat stalked, Calyxes campanulate, Branches spiny
10223 Shrubby, Petioles spiny, Leaves pinnated, Flowers axillary subsessile, Cal. inflated
10224 Shrubby spiny, Leaves simple



10225 Leaves in fours cuneate rounded, Stipules undivided, Stem nearly smooth

10226 Cal. altern without appendage upper lip emarginate, lower entire
10227 Cal whorled without appendage lower lip entire, Stem and leaves hairy
10228 Cal. altern without appendage. upper lip entire, lower 3-toothed
10229 Cal. altern with an appendage: upper lip entire, lower 3-toothed
10230 Cal half-whorled with an appendage upper lip bifid, lower about 3-toothed
10231 Cal. altern with an appendage upper lip 2-parted, lower 3-toothed
10232 Leaves digitate, Cal whorled without append. Upper lip emarg, lower bifid, Pods 2-seeded
10233 Cal altern with an appendage upper lip half-bifid, lower obscurely 3-toothed
10234 Cal whorled with an appendage upper lip 2-parted, lower entire
10235 Cal. altern. with an appendage upper lip 2-fid, lower entire, Leaflets linear-lanceolate flat
10236 Cal. altern with an appendage upper lip 2-fid, lower subtrifid, Leaflets linear channelled
10237 Cal whorled with an appendage upper lip 2-parted, lower 3-toothed
10238 Cal. half-whorled with an appendage. upper lip 2-fid, lower undivided, Leaves simple obl villous
10239 Shrubby, Cal. whorled without appendage stalked. lips acute entire

10240 Teeth of calyx 4 blunt, one acuminate
β Leaflets emarginate, Calyxes hoary
10241 Smoothish, Leaves on short stalks blunt at each end, Spikes solitary short, Pods 1-seeded
10242 Leaves on short stalks without a point obtuse smooth, Spikes long panicled downy
10243 Hoary, Leaflets subsessile ovate-elliptical acute mucronate, Spikes panicled hoary
10244 Said to be the same as *A microphylla*
10245 Ferruginous, Spikes simple clustered, Leaflets ovate-lanceolate downy mucronate

10246 The only species

10247 Raceme solitary shorter than leaves, Pedunc 2, Bractes less than cal spreading, Pods pendulous
10248 Raceme solitary length of leaves, Pedunc 2, Bractes less than cal appressed, Pods pendulous
10249 Pods scymetar-shaped somewhat lunate smooth
10250 Vexillum of flowers revolute, Calyxes whole colored
10251 Peduncles subcapitate, Seeds 4-cornered cylindrical powdery
10252 Peduncles thicker than petiole capitate, Wings subfalcate deformed, Pods linear straight
10253 Flowers capitate. Cal bracteate. Vexill short. Wings expanded very large, Leaflets deltoid oblong

and Miscellaneous Particulars.

of the soil: but this is a very doubtful explanation The species are border flowers, in much esteem for their velvet-like leaves and fine large flowers They are vigorous growing plants, and most of them would afford the agriculturist a considerable bulk of herbage.

L. albus is supposed to be the species that was cultivated for this purpose by the Romans, though L. luteus is what is at present grown in the fields in the south of Italy as human food. In the south of France, it is grown in poor dry extensive plains, as a meliorating crop to be ploughed in where no manure is to be had, and the ground is too sterile for clover or other better plants. (*Villars.*) The perennial and ligneous species may be increased by pieces of the root, but they all seed freely

1545. *Amorpha.* From α, privative, and μορφη, form, in allusion to the deformity of the corolla, which has neither alæ or carina A fruticosa was once used in Carolina as an indigo plant, but is now neglected. All the species are of easy cultivation, and increase by seeds or cuttings in sand

1546. *Abrus* From αβρος, elegant The roots are used in the West Indies similarly to those of our liquorice, and the seeds are strung and worn as beads for ornaments, and also as rosaries, whence the specific name *precatorius* They are frequently thrown, with other West Indian seeds, on the north-west coast of Scotland Linnæus affirms, that they are very deleterious, but they are eaten in Egypt, though the hardest and most indigestible of the pulse tribe. In our stoves the plant requires a good deal of room and heat in order to flower freely. It is generally raised from seed, but cuttings will root in sand plunged in heat

1547 *Phaseolus.* From *phaselus*, a little boat, which the pods may easily be supposed to resemble P vulgaris and multiflorus, *Haricot*, Fr., *Schminkbohne*, Ger, *Fagiuolo*, Ital, are well known culinary legumes The dwart kidney bean is earlier than the other, and better adapted for forcing, but much the largest crop

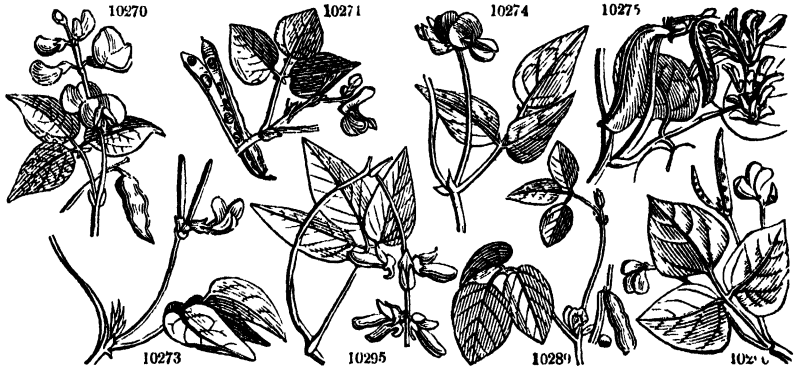
History, Use, Propagation, Culture,

is produced by the twining species Neither sorts can be safely planted in the open air before the end of April, or first week of May, and the leaves are blackened by the first frosts of autumn But in a stove or pit, green pods of the dwarf kinds may be gathered all the winter, and with this advantage over forced productions of the fruit kind required to be ripened, that the pods are as good from plants in the stove in midwinter, as from those in the open garden in midsummer The garden culture of both species is so easy and universally known, that we shall not occupy ourselves with details Though in this country the green pods only are used, on the continent the ripened seeds are as much the object of culture In Holland, the twiner is grown in every cottage garden for both purposes, and in France and Switzerland, it is grown chiefly for the ripened seeds in the latter countries it grows on very poor dry soil. On the first blackening of the leaves with frost, the plants are pulled up, dried like tobacco leaves under the dripping eaves of the houses, and in winter threshed out for the seeds, to be boiled and eaten with cream or butter, stewed in haricots, or put in soups. According to the analysis of Einhoff, 3840 parts of kidney bean afforded 1805 parts of matter analogous to starch, 857 of vegeto-animal matter, and 709 parts of mucilage from which is to be inferred, that it is the most nourishing of all the legumes

The perennial stove species thrive best in a light rich soil, and may be propagated readily from cuttings or from seed. P caracalla, or Snail-flower, is a very curious species, and will grow and flower freely, if kept clear from the red spiders This species was so named by the Portuguese, who first brought it from South America, in consequence of its hooded flower Caracalla (from the Celtic words *car*, a head, and *cal*, a covering) was the name of a hooded dress much worn by the Gauls, and gave his nickname to the Emperor Marcus Aurelius Antoninus, who was accustomed to wear the dress.

10254 Flowers spiked, Cal. without bractes, Wings expanded larger, Leaflets ovate
10255 Flowers loosely spiked, Wings the length of vexillum
10256 Vexillum and keel spirally twisted together
10257 Stem hairy, Lateral leaflets 3-lobed · terminal 5-parted, Segm. lanceol. Peduncles 3-fl. shorter than petiole
10258 Stem smooth, Lateral leafl 2-lobed, terminal 3-lobed : segments ovate, Pedunc. 3-fl longer than petiole
10259 Stem smooth, Leafl blunt lateral sinuose, terminal hastate 3-lobed, Peduncles longer than leaf spiked
10260 Stem smooth, Bractes larger than calyx, Pods pendulous compressed rugose
10261 Stem round, Flowers capitate, Pods cylindrical horizontal
10262 Stem angular hispid, Pods pendulous hairy
10263 Stem flexuose round hairy, Pods capitate hairy
10264 Downy, Lower leaves rhomboid oval. upper 3-lobed, Heads on long stalks, Pods round subulate



10265 Leaflets oblong acuminate, Peduncles elongated, Pods round subulate
10266 Leaflets about 3-lobed, Lobes acuminate, Racemes axillary

10267 Leaflets ovate-lanceolate downy

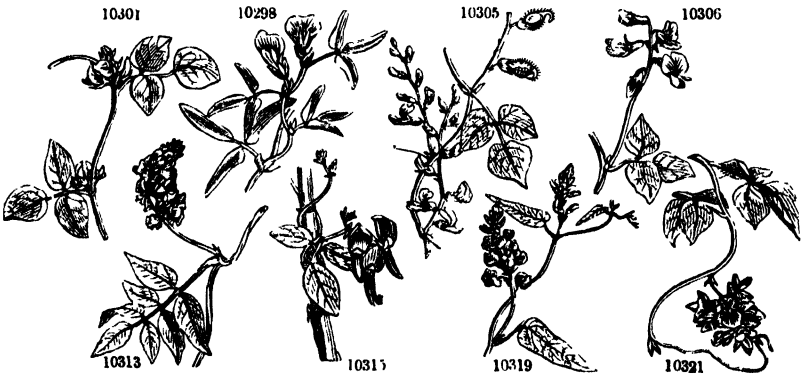
10268 Leaflets ternate smooth, Flowers in heads, Calyxes hairy campanulate
10269 Flowers imbricated

10270 Pods ovate acinaciform, Seeds ovate with a hilum curved towards one end
10271 Pods pendulous cylindrical torulose, Peduncles erect many-flowered
10272 Pods capitate many cylindrical, Seeds rounded
10273 Pods capitate subcylindrical with a recurved concave end
10274 Pods capitate few cylindrical with a mucronate straight point
10275 Pods racemose ensiform with 3 keels at back straight at point, Seeds with an arillus
10276 Pods membranous quadrangular
10277 Pods subcylindrical smooth very long
10278 Pods racemose compressed hairy, Outer leaflets 2-lobed
10279 Pods subracemose linear hairy, Leaflets ovate-lanceolate downy
10280 Pods racemose compressed 4-seeded, Leaflets rhomboid
10281 Pods racemose acinaciform 4-seeded, Leaflets rhomboid smooth
10282 Leaves ovate downy, Flowers solitary, Seeds 2-horned
10283 Leaves ovate acute rugose netted villous, Racemes few-flowered
10284 Leaves smooth toothed with many angles
10285 Stem smooth, Petioles downy, Wings of corolla spreading
10286 Peduncles capitate, Pods straight linear
10287 Flowers somewhat spiked, Pods subcylindrical smooth, Leaves roundish rhomboid blunt entire smooth
10288 Pods acinaciform with 3 keels
10289 Racemes axillary erect, Pods pendulous hispid about 2-seeded
10290 Pods twin linear nearly erect
10291 Stem smooth, Peduncles 2-flowered, Outer leaflets somewhat angular
10292 Stem creeping, Leaflets roundish shining, Fl racemose, Pods with 3 keels at back

10293 Pods racemose hairy equal, Seeds surrounded by the hilum, Leaves smooth on each side
10294 Pods racemose with transverse lamellæ hairy, Seeds surrounded by the hilum
10295 Pods racemose valves keeled hairy, Peduncles in threes

and Miscellaneous Particulars

1548 *Teramnus* So called by Browne, apparently in allusion to its delicately-shaped legume, τερμνοτης being used particularly to express the tenderness of eatable pulse, ατερμων was a weed hostile to leguminous plants.



1549 *Carpopogon* From καρπος, fruit, and πωγων, a beard, the pods being bearded. Rapid growing climbers of the easiest culture.

1550 *Dolichos* A name under which Dioscorides describes a plant supposed to have been the kidney bean of the moderns The species are climbers, some of them to the height of the highest trees. The pods of most of them are eatable, but far inferior to the kidney bean Some of them have tuberous roots which may be eaten The seeds of D Soja (*Somju*, Jap), which are usually called *Miso* in Japan, are put into soups, and are the most common dish there, insomuch that the Japonese frequently eat them three times a day The Soja of the Japonese, which is preferred to the Kitjap of the Chinese, is prepared from these seeds, and is used in almost all their dishes instead of common salt. The Chinese also have a favorite dish made of these seeds, called *Teu hu* or *Tau hu*, which looks like curd, and though insipid in itself, yet with proper seasoning is agreeable and wholesome (*Thunb* and *Loureiro*)

The perennial kinds are easily increased by cuttings, and all the species seed freely D purpureus and lignosus have the handsomest flowers, but none of them can be considered of much beauty.

1551. *Stizolobium* From στιζω, to prick, and λοβος, a pod. S. urens and pruriens produce on the outside of their pods the irritating substance used in medicine as a vermifuge, under the name of Cowhage The species are twining shrubs of the West Indies, with long bunches of yellow scentless flowers The seeds of S urens are often seen in cabinets of curiosities many qualities are attributed to them by the superstitious Creoles. The French settlers call them *Yeux bourrique*, asses' eyes. S. pruriens is considered a powerful diuretic.

History, Use, Propagation, Culture,

1552. *Glycine.* From γλυκυς, sweet G monoica perfects its seeds under ground like Arachis hypogæa, Trifolium subterraneum, and Lathyrus subterraneus They are all of easy culture, like their preceding and following allies G. frutescens, and especially G sinensis, are most beautiful hardy climbing shrubs, with long pendulous branches of blue flowers, like the Laburnum

1553. *Kennedia* Named after Mr Kennedy, a nurseryman of celebrity in the vicinity of London. Handsome conservatory climbers of the easiest culture

1554 *Cylista* From κυλιξ, a calyx, that of the species so called being very large

1555. *Galactsa* From γαλα, milk, the plant is milky in all its parts A pretty flowering climber of easy culture in the soil indicated, and increased by cuttings in sand under a bell-glass

1556. *Clitoria* A name derived from an anatomical term, a resemblance to the subject of which has been fancied to exist in the flower C Ternatea was first brought to Europe from Ternate, one of the Moluccas islands, which induced Tournefort to adopt Ternatea as a generic appellation, and it was continued by Linnæus as a specific one

10296 Leaves ternate ovate smooth, Racemes filiform about 3-fl Flowers apetalous, Pods oblong 2-seeded
10297 Leaves ternate ovate smooth, Stem hairy, Racemes pendulous, Fls of stem with cor of root apetalous
10298 Leaves ternate, Leaflets linear lanceolate silky, Fl. axillary solitary, Pods 2-seeded
10299 Leaves ternate, Leafl oval hairy beneath, Pods subsolitary linear many-seeded, Style persistent straight
10300 Leaves ternate hairy, Racemes lateral
10301 Leaves ternate tomentose, Racemes axillary very short, Pods 2-seeded
10302 Downy, Leaves simple reniform rounded rugose netted, Racemes few-flowered
10303 Leaves ternate ovate acute hairy viscid, Peduncles jointed 1-2-fl Pods oblong
10304 Leaves tern ovate rhomboid pubesc beneath netted tomentose, Racemes axillary, Pods subpubescent
10305 Leaves ternate ovate rhomboid beneath dotted with resin, Racemes longer than leaf
10306 Leaves ternate, Flowers racemose, Pods tumid villous
10307 Leaves ternate ovate somewhat hairy, Racemes axillary, Pods linear hooked at end
10308 Leaves simple sagittate, Petioles winged, Stem twining shrubby
10309 Leaves tern roundish rhomboid smooth beneath dotted with resin, Racemes 1-sided longer than leaf
10310 Leaves pinnate, Leaflets 5 oblong apiculate, Flowers 3 axillary
10311 Leaves ternate villous beneath, Racemes terminal
10312 Leaves pinnated, Leaflets 11 ovate lanceolate silky, Raceme terminal nodding lax many-flowered
10313 Root tuberous, Lvs pinn. Leafl 5-7 ov lanc narrowed towards the end, Spikes dense shorter than leaves
10314 Leaves pinnated, Leaflets 9 ovate downy, Racemes dense terminal with bracteæ, Pods coriaceous

10315 Leaves ternate, Leaflets ovate, Pedunc. about 3-fl Pods very hairy
10316 Leaves ternate, Leaflets obovate, Flowers capitate, Pods smoothish
10317 Leaves ternate, Leaflets obovate villous, Pedunc 1-2-fl Keel longer than obl wings, Stem prostrate
10318 Leaves ternate, Leaflets ovate retuse netted, Racemes erect many-flowered
10319 Leaves simple smooth netted subcordate at base, Flowers racemose
10320 Leaves simple ovate, Racemes axillary few-flowered

10321 Cal membranous, Upper segment bifid
10322 Down rusty, Cal half 5-fid, Bractes ovate acuminate, Cor larger than cal
10323 Cal scarious, Upper segment emarginate

10324 Leaves ternate, Raceme erect, Flowers pendulous

10325 Leaves quinate pinnate, Peduncles axillary 1-flowered
10326 Leaves pinnate, Leaflets 5 round lanceolate or linear
10327 Leaves ternate, Calyxes solitary campanulate
10328 Leaves ternate, Calyxes twin campanulate
10329 Leaves ternate, Calyxes cylindrical
10330 Leaves ternate, Peduncles many-flowered, Ovary downy, Style villous
10331 Leaves ternate, Leaflets ovate-oblong acuminate, Cal campanulate shorter than ovate bractes
10332 Leaves ternate, Leaflets mucronate glaucous beneath hairy, Cal cylind much larger than bractes

10333 Leaves conjugate subsessile, Stipules toothed
10334 Leaves pinnate in 4 or 5 pairs obl glaucous beneath, Stipules half sagittate toothed at base
10335 Leaves of 2 pairs linear subulate approximating, Stip half-sagittate subulate 1-toothed at base
10336 Leaves pinnate in 3 pairs ovate acuminate, Stipules half-sagittate entire, Stem simple
10337 Leaves pinnate in 3 or 4 pairs lanceolate, Stipules half-sagittate entire, Stem winged
10338 Leaves of 2 pairs linear-subulate downy, Stip half-sagittate subulate nearly entire, Stem simple downy
10339 Stem branched, Leaves in 2 pairs linear, Stipules half sagittate subulate
10340 Leaves in 2 pairs ensiform stalked, Stipules simple, Stem simple
10341 Leaves in 4 pairs lin lanc Stipules half-sagittate entire, Stem winged branched upwards
10342 Leaves of 2 pairs lin-lanc mucronate stalked nerved, Stipules half-sagittate toothed at base
10343 Leaves conjugate stalked, Stipules entire, Plant covered with long hairs

and Miscellaneous Particulars

1557. *Orobus* From ὄρος, to excite, and βους, an ox, that is to say, a food nourishing to cattle Handsome plants, and free flowerers O luteus Haller considers as one of the handsomest of the papilionaceous tribe. O tuberosus, according to Lightfoot, is in great esteem among the Highlanders of Scotland for the tubercles of the root, they dry and chew them in general to give a better relish to their liquor, they also affirm them to be good against most disorders of the thorax, and that by the use of them they are enabled to repel hunger and thirst for a long time In Breadalbane and Ross-shire, they sometimes bruise and steep them in water, and make an agreeable fermented liquor with them. They have a sweet taste, something like the roots of liquorice, and when boiled are well flavored and nutritive, and in times of scarcity have served as a substitute for bread (*Lightfoot*)

Boiled well, a fork will pass through them, and dried slightly and roasted, they are served up in Holland and Flanders in the manner of chesnuts, which they resemble in flavor Dickson (*Hort Trans* ii 359) recommends cultivating them in a bed or border of light rich soil, paved at the depth of twenty inches, to prevent their roots from running down Plant the tubers six inches apart, and three inches below the surface,

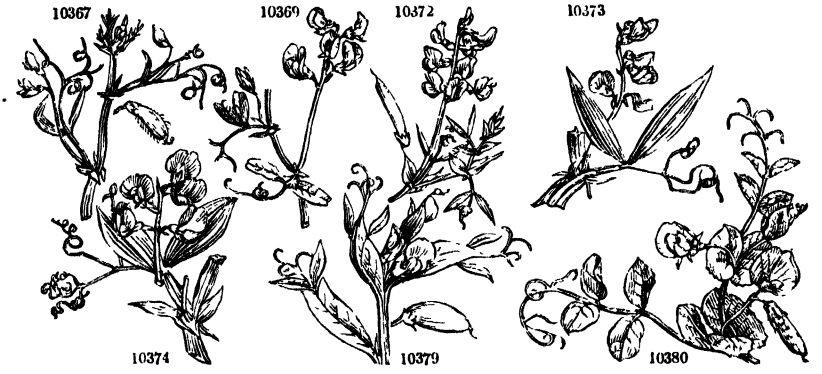
History, Use, Propagation, Culture,

the second year some will be fit to gather, and by taking only the largest, the bed will continue productive for several years, adding some fresh compost every year

1558 *Lathyrus* A name employed by Theophrastus to designate a leguminous plant. It is said by his commentator Bodæus a Stapel, to have been derived from λα, an augmentative particle, and θουρος, any thing which is exciting, and to have been applied to this plant in consequence of certain aphrodisiacal qualities ascribed to it. L. sativus, *Gesse*, Fr, is frequently sown in Switzerland for soiling horses In several parts of the continent, a white light pleasant bread is made from the flour of this pulse, but it produced such dreadful effects in the last century, that the use of it was forbid by an edict of George, Duke of Wurtemburg, in 1671, and this not being observed, was enforced by two other edicts under his successor Leopold, in 1705, and 1714

Mixed with wheat flour in half the quantity, it makes a very good bread, that appears to be harmless. But bread made with this flour only has brought on a most surprising rigidity of the limbs in those who have used it for a continuance, insomuch that the exterior muscles could not by any means be reduced, or have their natural action restored These symptoms usually appeared on a sudden, without any previous pain; but sometimes they were preceded by a weakness and disagreeable sensation about the knees Baths, both hot and cold, fomentations and ointments of various kinds have been tried without effect, insomuch that it is regarded as incurable, and being neither very painful nor fatal, those who are seized with it usually submit to it with patience

Swine fattened with this meal lost the use of their limbs, but grew very fat lying on the ground. A horse fed some months on the dried herb, was said to have his legs perfectly rigid. Kine are reported to grow lean on it, but sheep not to be affected Pigeons, especially young ones, lose the power of walking by feeding on the seed. Poultry will not readily touch it, but geese eat it without any apparent damage. In some parts of Switzerland, cattle feed on the herb without any harm It would be worth enquiring, therefore, whether the soil may not contribute something to the ill qualities of the plant, and it is remarked that the seed from a strong, fat, moist soil, is much more deleterious than from a light dry one (*Duvernoy*)



Fabbroni, from Florence, in 1786, says, that the government there has cautioned the peasants against the

10344 Leaves in 2 pairs ensiform, Stipules subulate, Stem simple
10345 Stem branched, Leaves in 6 pairs ovate oblong
10346 Stem branched, Leaves in 2 pairs lanceolate nerved, Stipules somewhat spiny
10347 Leaves pinnate hairy of many pairs ovate lanc Stip half-sagitt. Stem branched decumbent hairy
10348 Leaves pinnate smooth of many pairs elliptical, Stipules ovate lanceol. Stem branched erect hairy

10349 Peduncles 1-flowered, Tendrils leafless, Stipules sagittate cordate
10350 Peduncles many-flowered, Leaves simple, Stipules subulate
10351 Peduncles 1-flowered longer than calyx, Tendrils 2-leaved simple
10352 Peduncles 1-flowered, Tendrils 2-leaved, Pods ovate compressed channelled at back
10353 Peduncles 1-flowered, Tendrils 2-leaved and 4-leaved, Pods ovate compressed with 2 edges at back
10354 Peduncles 1-flowered shorter than calyx, Tendrils 2-leaved simple, Leaflets lanceolate
10355 Peduncles 1-flowered, Tendrils 2-leaved, Leaflets setaceous linear
10356 Peduncles 1-flowered as long as cal Petioles 2-leaved, Leaflets lanc. Pods linear roughish mucronate
10357 Peduncles 1-flowered awned, Tendrils 2-leaved simple ensiform
10358 Peduncles 1-flowered awned, Tendrils 2-leaved simple, Leaflets linear
10359 Peduncles 1-flowered, Tendrils 4-leaved, Petioles winged, Pods compressed
10360 Peduncles 1-flowered awned, Tendrils many-leaved, Leaflets linear truncate mucronate
10361 Peduncles about 1-fl Tendrils many-leaved, Leaflets alternate lanceolate, Petioles winged
10362 Peduncles 2-flowered, Tendrils 2-leaved, Leaflets ovate oblong, Pods hairy
10363 Peduncles 2-flowered naked, Tendrils 2-leaved, Leaflets obovate wavy, Stems rigid 4-angled
10364 Peduncles 2-flowered, Tendrils 2-leaved, Leaflets ensiform, Pods smooth, Stipules 2 parted
10365 Peduncles 2-flowered, Tendrils 2-leaved, Leaflets altern linc smooth, Stipules lunate
10366 Peduncles 2-flowered, Tendrils many-leaved, Leaflets lanceolate, Stipules toothed
10367 Peduncles about 3-flowered, Tendrils many-leaved, Leaves lanc Pods hairy, Seeds rough
10368 Peduncles long many-fl Stipules broad cordate sagittate, Tendrils 2-leaved
10369 Pedunc many-fl. Tendrils 2-leaved, Leaflets oval, Joints naked
10370 Pedunc 1-fl shorter than stipules, Tendrils 2-4-leaved, Stip toothed, Pods erect turgid and villous
10371 Pedunc many-fl Tendrils 2-leaved, Leaflets roundish, Joints membranous
10372 Pedunc many-fl. Tendrils 2-leaved quite simple, Leaflets lanceolate
10373 Pedunc many-fl Tendrils 2-leaved, Leaflets ensiform, Joints membranous
10374 Pedunc. many-fl Tendrils 2-leaved, Leaflets lanceolate, Joints membranous
10375 Pedunc many-fl Tendrils 2-leaved and 4-leaved, Leaflets lanc Joints membranous
10376 Pedunc many-fl Tendrils many-leaved, Leaflets linear lanc acute
10377 Pedunc many-fl. Tendrils many-leaved, Leafl lanc obl blunt mucronate, Joints membran Pods curved
10378 Pedunc. many-fl Tendrils many-leaved, Leafl ellipt blunt, Stipules half-sagitt ovate broader than leaflet

10379 Petioles decurrent membranous 2-leaved, Peduncles 1-flowered

10380 Petioles round, Stipules rounded below crenate, Peduncles many-flowered

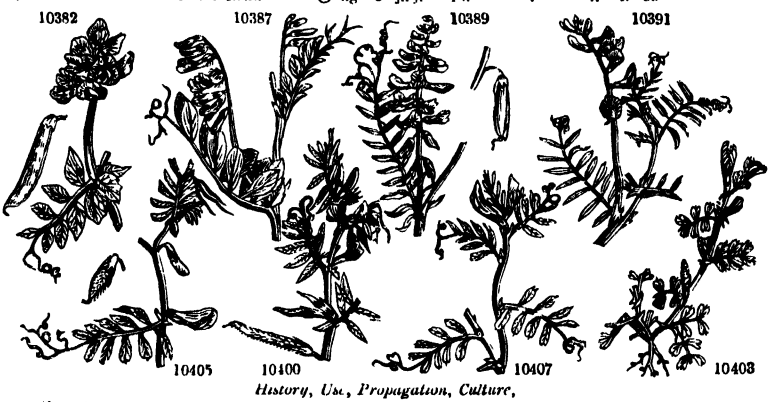
and Miscellaneous Particulars.

use of Lathyrus sativus, swine having lost the use of their limbs, and become pitiable monsters by being fed on this pulse exclusively The peasants, however, eat it boiled, or mixed with wheat flour, in the quantity of one-fourth, without any harm

The poisonous Lathyrus from Barbary, is L semine punctato of Casp Bauhin, and seems to be only a variety, for in the crops of L. sativus in Italy, they find black seeds striped with white, as in the African seed Fabbroni suspects it to be a mule between L sativus and Cicera, for the flower and seed partake of the characters of both, having a black seed marked with white, and a white banner with a red keel to the corolla. (*Fabbroni's Letters in* MSS *Banks*)

L. odoratus is one of our most esteemed border annuals, and is extensively grown in pots for decorating chambers and windows L tingitanus, articulatus, and annuus are also sown as border annuals

L. tuberosus produces tubers on the roots, like those of the earth nut (Bunium bulbocastanum), these are sold in the markets of Holland, like those of Orobus tuberosus and Trapa natans, and their flavor is highly esteemed



L. latifolius is a very shewy plant for shrubberies, arbors, and trellis work, and yields a great quantity both of green fodder and seeds, which some botanists have suggested might be applied to agricultural purposes.

1559 *Ochrus; ὠχρὸς*, yellow, in allusion to the color of its flowers. A small annual plant with yellow flowers, native of hedges in the south of Europe

1560. *Pisum* From the Celtic *pis*, a pea P. sativum, *Pois*, Fr., *Erbse*, Ger, and *Pisello*, Ital, is the most valuable of culinary legumes. Like most domestic plants of great antiquity, its native country is unknown, though it is commonly referred to the south of Europe The varieties of the pea are numerous, and differ widely among themselves from the early frame, a low plant bearing only one white blossom on each footstalk, to the crown-bearing, having pink blossoms on a terminating corymb The rouncival grows ten or twelve feet high, and the imperial not two feet. The sugar-pea has pods in which the inner film is wanting, or much less tough than usual, which admits of boiling the pods entire, and eating them in the same manner as kidney beans

In the open garden, the pea is sown at intervals from January to the middle of July, and a succession of

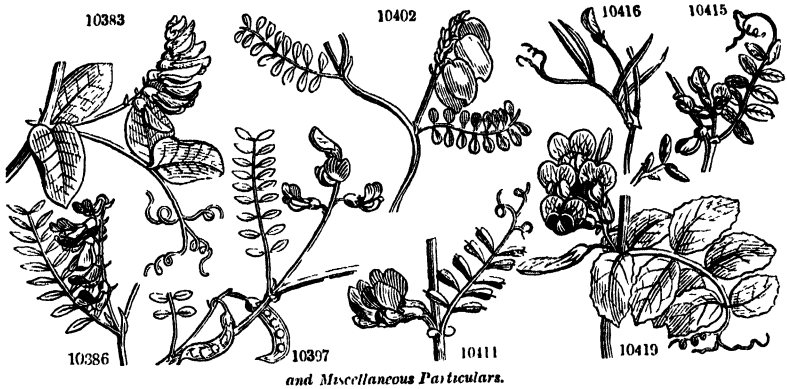
History, Use, Propagation, Culture,

crops is thus obtained from the end of May to the beginning of November By raising in hotbeds and transplanting, the first crop may be gathered in the beginning of May, and by raising and maturing in pits, pease may be gathered in April The pea, however, does not force well, and requires extraordinary attention to giving air, otherwise the blossoms will not set The culture of the pea is known to every countryman

The grey pea, cultivated in agriculture, is by some considered as a species, though it is obviously a mere variety, not further removed from the frame pea than is the blue Prussian, or the crown pea. A dry soil and season is essential for a good crop, unless the plants can be supported by sticks like the garden crops The seed is chiefly used for feeding pigs, and splitting for soup In boiling split pease, some samples, without reference to variety, fall or moulder down freely into pulp, while others continue to maintain their form. The-former are called boilers This property of boiling depends on the soil, stiff land, or sandy land that has been limed or marled, uniformly produces pease that will not melt in boiling, no matter what the variety may be Pease straw cut green and dried, is reckoned as nourishing as hay, and is considered as excellent for sheep. The produce of pease in flour is as three to two of the bulk in grain, and husked and split for soups as four to two A thousand parts of pea flour affforded Sir H Davy 574 parts of nutritive or soluble matter, viz. 501 of mucilage, or vegetable animal matter, 22 of sugar, 35 of gluten, and 16 of extract, or matter rendered insoluble during the operation

P. maritimum has seeds of a bitterish disagreeable taste, but are reported nevertheless to have been eaten in times of scarcity. (*Turner's Herbal*)



1561 *Vicia* From *gwig*, Celtic, whence βικιον, Greek, *vicia*, Latin, *vesce*, French, *vetch*, English, &c. V sylvatica and cracca, where they occur in meadows, are considered valuable herbage plants They yield great bulk of fodder, which is allowed to be very nutritive. Some have proposed to cultivate them alone, but Curtis observes, they would probably in that case choke themselves for want of support.

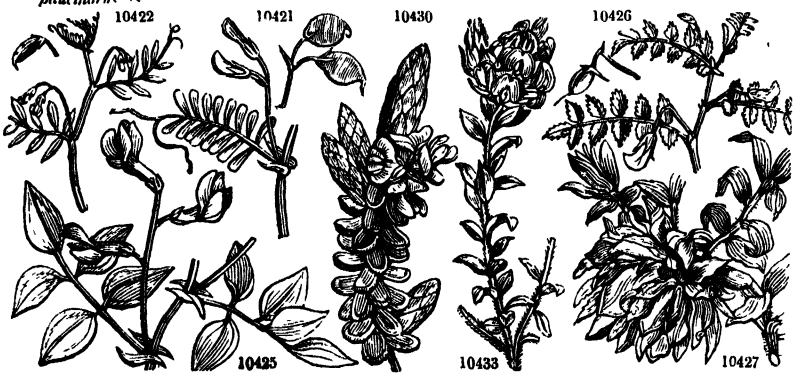
V. sativa, the winter and summer tare, fetch or vetch, is a valuable agricultural plant. Some consider the winter variety as a distinct species, but Professor Martyn proved, by cultivating both, that they were not

10381 Petioles 4 leaved, Stipules crenate, Peduncles 1-flowered
10382 Petioles flat above, Stem angular, Stipules sagittate, Peduncles many-flowered

10383 Peduncles many-fl Petioles many-leaved, Leaflets ovate: lower sessile
10384 Peduncles many-fl Leaflets reflexed ovate mucronate, Stipules somewhat toothed
10385 Peduncles many-fl longer than leaf, Leaflets ellipt. Stipules lunate with setaceous teeth
10386 Peduncles many-fl shorter than leaf, Leaflets oblong subpubesc Stipules half sagittate entire lanceolat
10387 Peduncles many-fl shorter than leaf, Teeth of calyx setaceous very villous, Leaflets lanceolate villous
10388 Peduncles many-fl longer than leaf, Flowers imbricated, Leaflets obl ovate villous, Stip half-sagittate
10389 Peduncles many-fl longer than leaf, Flowers imbricated, Leafl lanc blunt, Stip half-sagitt lin subulate
10390 Peduncles many-fl longer than leaf, Flowers imbricated, Leafl lin smoothish 3-nerved, Stip lin entire
10391 Peduncles many-fl longer than leaf, Flowers distant, Leafl lin. Stip half-sagitt lin lanc toothed at base
10392 Peduncles many-fl Petioles suleate 12-leaved, Leaflets lanc smooth, Stip. half-sagittate stalked
10393 Peduncles many-fl Leaflets obl Stipules entire, Pods villous ovate oblong
10394 Peduncles many-fl Leaves entire, Stipules entire, Pods nearly erect
10395 Peduncles many-fl long, Upper leaves subcirrhous, Stipules half-sagittate entire, Leafl oval-obl hoary
10396 Peduncles many-fl long, Leaves not cirrhous, Leafl obl lanc silky beneath, Stip lanceol entire
10397 Peduncles many-fl shorter than leaf which is not cirrhous, Leaflets obovate emarginate, Stip oblong
10398 Peduncles 2-flowered awned shorter than leaf, Leaflets linear narrowed at each end, Stip half-sagittate
10399 Pods subsessile solitary, Leaflets ovate, Stipules marked 4-toothed
10400 Pods sessile sub-binate, Leaflets obl. ovate truncate mucronate, Stipules toothed marked

10401 Pods sessile sub-binate spreading, Lower leaflets ovate emarginate upper lin entire, Seeds globose
10402 Pods sessile lower subterranean, Leaflets linear truncate, Stipules half-sagittate
10403 Pods sessile solitary erect smooth, Leaflets 6 lower subcordate
10404 Pods sessile solitary reflexed hairy, Stems diffuse, Stipules colored, Standard smooth
10405 Pods sessile solitary reflexed hairy 5-seeded, Standard villous
10406 Pods stalked reflexed, Standard silky, Stipules lanceolate marked, Upper leaflets obl elliptical acute
10407 Pods sessile solitary reflexed smooth, Stems nearly erect, Leaves quite smooth
10408 Pods sessile solitary reflexed downy, Leaflets linear blunt, Stipules half-sagittate entire
10409 Pedunc 1-fl in fruit longer than leaf and awned, Leaflets linear blunt mucronate, Stipules multifid
10410 Pods stalked about 3, and the standard hairy, Stipules lanceolate marked
10411 Pods subsessile twin reflexed smooth, Leaflets obl ovate retuse, Stipules marked
10412 Pedunc 1-fl very short, Leafl lin lanc truncate, Stipules lanc undivided, Pods finely downy
10413 Pods subsessile pendulous smooth 4-seeded, Leaflets linear emarginate
10414 Pedunc 1-fl awned, Leaflets lanceolate blunt, Stipules bifid
10415 Pods stalked about 4 erect, Leaflets ovate entire
10416 Pods stalked solitary erect, Leaflets 4 oval-lanceolate, Stipules toothed
10417 Pods subsessile solitary compressed somewhat inflated, Leaflets ovate toothed at end, Stip cil toothed
10418 Pods subsessile subternate compressed, Leaflets ovate entire, Stipules ciliate toothed at base
10419 Pods subsessile subternate, Leaves and stipules serrate
10420 Pods subsess subtern torulose, Leaflets ovate entire, Petioles not cirrhous, Stip sagittate toothed at base

and Miscellaneous Particulars.



even very distinct varieties The winter variety is sown in September and October, and the summer at different periods, from February to June, for successional cuttings The soil requires to be in a good heart, otherwise they will produce but a poor crop of herbage. on a good soil they will yield ten or twelve tons, which is found excellent for milch cows and working stock The crop is seldom left to ripen its seeds, but when seeds are wanted, the only use made of them being for sowing or feeding pigeons

V narbonensis and serratifolia are cultivated in Germany in the same manner as our tare Vicia sepium has been recommended to be sown among clover for mowing

V Faba is a well known legume both of the garden and the field The garden varieties are numerous, the earliest is a small seeded variety, the Mazagan, and the largest the Windsor. Beans are planted at the various times in which pease are sown, but the late sowings of this plant do not answer so well as those of the pea When the ground is properly pulverised and in good heart, they succeed well when transplanted, and where a first crop is injured by insects, if the stems are cut down to the ground during their flowering season, they will send up a succession of shoots, which will bear a crop In this way, according to some, the bean may be rendered perennial, as it is certain the scarlet kidney bean may by merely protecting the roots from the frost

The field bean, of which there is a larger and smaller sort, the latter called *ticks*, is sown in drills by a machine, so as to admit of horse hoeing, and otherwise ploughing or stirring between the rows. By this means a larger crop is produced, and the land cleaned and brought into a better state for a succeeding corn crop Beans are excellent food for hard working horses, and for fatting hogs for bacon The flower of beans and pease is more nutritive than that of oats, but less easy of digestion A bushel of beans is supposed to yield fourteen pounds more of flour than a bushel of oats, and a bushel of pease eighteen pounds more, or, according to some, twenty pounds A thousand parts of bean flour were found, by Sir H Davey, to yield 570 parts of nutritive matter, of which 426 were mucilage or starch, 103 gluten, and 41 extract, or matter rendered insoluble during the process.

History, Use, Propagation, Culture,

1562 *Ervum* From *erw*, tilled land, in Celtic, to which this plant is a pest E. lens (from *lentil*, Celtic), *Lentille*, Fr., *Lenize*, Ger, and *Lenticcia*, Ital, is a legume of the greatest antiquity, being in esteem in Esau's time, and much prized in eastern countries ever since. In Egypt and Syria they are parched in a frying-pan and sold in the shops, and considered by the natives as the best food for those who undertake long journies. There are three varieties of lentils cultivated in France and Germany, the small brown, which is the lightest flavored, and the best for haricots and soups, the yellowish, which is a little larger, and the next best; and the lentil of Provence, which is almost as large as a pea, with luxuriant straw, and more fit to be cultivated as a tare, than for the grain as human food. A dry warm sandy soil is requisite for the lentil, it is sown rather later than the pea, at the rate of a bushel, or one and a half bushel, to the acre, in other respects its culture and harvesting are the same, and it ripens sooner The produce of the lentil in grain is about a fourth less than that of the tare, and in straw it is not a third as much, the plants seldom growing above one and a half foot high The straw is, however, very delicate and nourishing, and preferred for lambs and calves, and the grain, on the continent, sells at nearly double the price of pease Einhoff obtained from 3840 parts of lentils, 1260 parts of starch, and 1433 of a matter analogous to animal matter.

1563 *Ervilia.* A word with the same meaning as *Ervum* See that word.

1564 *Cicer.* All authors agree in deriving the name from *κιχυς*, force; on account of the eminent qualities the ancients attributed to it. It grows naturally in the South of Europe, and is cultivated there for the same purposes as the lentil, but it is too delicate for field culture in this country It is called *Arietinum*, because the young seed bears a very curious resemblance to a ram's head.

1565. *Liparia.* From *λιπαρος*, brilliant, in allusion to the surface of the leaves. "The species," Sweet observes, "thrive very well in a mixture of loam and peat, and do not require so much water as some other genera of the order L. villosa, vestita, sericea, and some others, if they get too much water over their leaves

10421 Pedunc. 2-fl. Seeds compressed, Leaflets entire
10422 Pedunc about 2-fl. Pods smooth 4-seeded, Leaflets oblong truncate
10423 Pedunc many-fl Pods hairy 2-seeded, Leaflets lin blunt
10424 Pedunc 2-fl. awned, Pods smooth 2-seeded, Leaflets lin lanceolate downy

10425 Pedunc awned shorter than leaf, Leaflets obl. truncate smooth, Stipules hastate

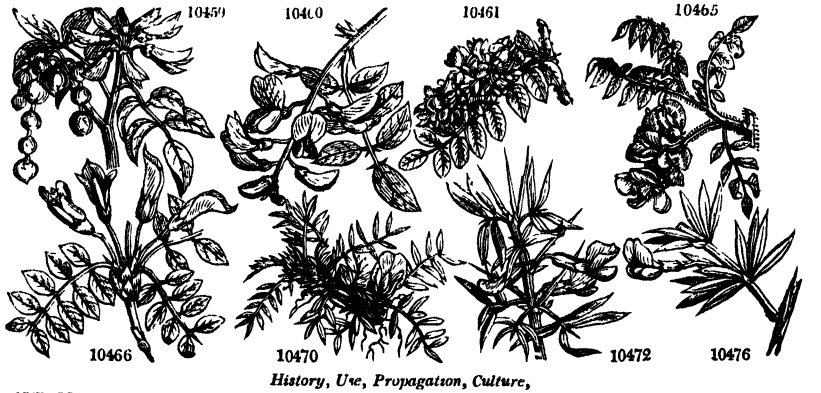
10426 Pedunc. 1-fl Seeds globose gibbous, Leaflets serrated

10427 Flowers capitate, Leaves lanceolate nerved smooth
10428 Flowers capitate head erect, Leaves lanceolate smooth
10429 Flowers capitate, Leaves lanceolate downy
10430 Flowers capitate, Leaves ovate concave woolly beneath
10431 Flowers spiked hairy, Leaves lanceolate, and angular stem smooth
10432 Flowers fascicled, Leaves ovate villous downy
10433 Flowers racemose, Leaves obovate oblong smooth, Stem hairy
10434 Flowers somewhat spiked, Leaves ovate villous downy

10435 Racemes simple pendulous, Leaflets ovate oblong, Pods hairy
10436 Racemes simple pendulous, Leaflets ovate oblong rounded at base, Pods quite smooth
10437 Racemes lateral erect, Branches round spreading, Leaflets ovate downy
10438 Racemes terminal erect, Calyxes hairy teeth minute, Leaflets ellipt hairy
10439 Racemes terminal erect, Calyxes villous segments falcate, Leafl obovate oblong
10440 Racemes terminal erect, Calyxes and pods viscid, Leaflets oblong
10441 Racemes erect, Calyx with a triple bractea, Floral leaves sessile
10442 Racemes terminal 1-sided, Leaves pinnated hoary, Leaflets roundish elliptical
10443 Racemes axillary erect, Leaflets sublanceolate downy the middle one in a long stalk
10444 Raceme term 1-sided 4-fl Leaflets obovate downy beneath, Calyxes deeply 3-parted
10445 Pedunc aggregate subterminal, Calyxes hairy trifid, Leaflets obov mucronate hairy beneath
10446 Flowers capitate, Branches straight round villous, Leaflets ovate ellipt villous, Bract linear
10447 Fl in term umbels, Stems erect, Leaflets lanc strigose pubescent
10448 Fl umbelled term Stems erect, Leaflets ellipt smooth acute
10449 Fl axillary solitary stalked, Stems procumbent, Leaflets obovate, Pods linear repand

10450 Fl stalked sub-binate axillary, Stem decumbent, Leaflets obovate blunt
10451 Pedunc sub-binate axillary Stems diffuse-erect, Leaflets oblong lanceolate
10452 Flowers stalked lateral about 3 erect, Stem declinate branched, Leaflets obovate mucronate
10453 Flowers stalked axillary about 3, Calyxes campanulate, Leaflets obovate blunt hairy
10454 Flowers stalked lateral about 4, Stem erect, Branches long, Cal tubular, Leaflets obovate
10455 Racemes term erect, Leaflets obl rhomboid blunt, Stipules rounded ovate oblique
10456 Flowers in lateral umbels, Stems erect, Leaves ellipt erect silky beneath, Calyxes woolly
10457 Pedunc about 3 term Leaflets oblong lanceolate silky, Pods linear silky, Stems decumbent
10458 Flowers umbelled terminal, Cal 3-parted lower tooth trifid, Leaflets rounded obovate, Stems ascending

and Miscellaneous Particulars



will be killed Very young tops, taken off for cuttings, and planted under a bell-glass, in sand, are not difficult to root. (*Bot Cult* 217.)

1566 *Cytisus* Pliny says it was so called because found in *Cythnus*, one of the Cyclades The Cytisus of the ancients is believed to have been our Medicago arborea. A genus of ornamental trees and shrubs, of which the Laburnums, *Cytise des alpes*, Fr, *Bohnenbaum*, Ger, are well known and universally admired examples. There are two species of Laburnum, which are so much alike, that in most nurseries they are confounded together, or only one in cultivation. C alpinus is the tree Laburnum, whose timber (the false ebony of the French) is much prized by cabinet-makers and turners, for its hardness, beauty of grain, and durability The tree is frequently sown in plantations infested with hares and rabbits, who will touch no other tree as long as a twig of laburnum remains "Though eaten to the ground in winter," as Boutcher observes, "it will spring again next season, and thus afford a constant supply for these animals, so as to save the other trees till of a size to resist their attacks The timber has been sold for upwards of half a sovereign per foot." It becomes most valuable in light loams and sandy soils

C wolgaricus and purpureus are very handsome shrubs; and make a fine appearance when grafted on stocks of laburnum five or six feet in height

C. cajan (an alteration of the Malay name, *Catjang*), *Pois d'Angola*, Fr., is frequently planted in the West India Islands, chiefly in rows as a fence to the sugar plantations, and will thrive on barren land The seed is much eaten by poor people and negroes, and is esteemed a wholesome pulse. In the island of Martinico even the better sort of people hold it in estimation, and prefer it to the European pea. The chief use of it in Jamaica is for feeding pigeons, whence its name. The branches, with the ripe seed and leaves, are given to feed hogs, horses, and other cattle, which grow very fat on them. (*Sloane and Jacq. Obs.*)

History, Use, Propagation, Culture,

1567 *Mullera* In honor of Otho Frederick Muller, a Dane, one of the editors of the Flora Danica There have also lived four other Müllers, Germans, and botanists The fruit is remarkable for its form, which is that of a necklace, a number of little balls being united by stalks, and not opening as in other leguminosæ, but always remaining closed The flowers are pink, and the size of a bunch of Laburnum

1568 *Robinia* In memory of Jean Robin, herbarist to Henry IV. of France, author of Histoire des Plantes, &c, Paris, 1620 His son, Vespasian, was subdemonstrator at the Jardin de Roi, and was the first person who cultivated the R. pseudacacia in Europe

R. pseudacacia is a thorny fast-growing tree, of middling stature, of no great beauty as a tree, but ornamental when young, and very well adapted for copse-wood and rough timber The leaves come out late in spring, and fall off early in autumn, like those of the ash. The timber is much valued in North America, and said to be superior to that of the laburnum, "being close-grained, hard, and finely veined; and in America more valued by the cabinet-maker than any other native timber whatever Pursh, in his Flora, asserts, that being nearly incorruptible, it is equally useful for posts and gates. We are informed by a friend, that gate-posts of this timber, on a property near Baltimore, have remained fresh for nearly a century The finest pinnated leaves, and pendulous white odorous flowers, add greatly to its beauty Its value is scarcely known in this country." (*Cal. Mem* II. 414.) It prefers a deep sandy soil, and rather sheltered situation; being very apt to throw up suckers from the running roots, and as it stoles freely, it seems peculiarly calculated for coppice-woods Beatson (*Com to Board of Agr*) has cultivated it in this way to great advantage.

In North America the use of the locust-tree has hitherto been confined to trenails, on account of its scarcity, but were it as plentiful as oak, it would be applied for more purposes by the shipwright, such as knees, floor-timbers, and foot-hooks, being much superior to oak for its strength and duration, and, from the tree spreading into branches, affords full as large a proportion of crooks or compass timber as oak.

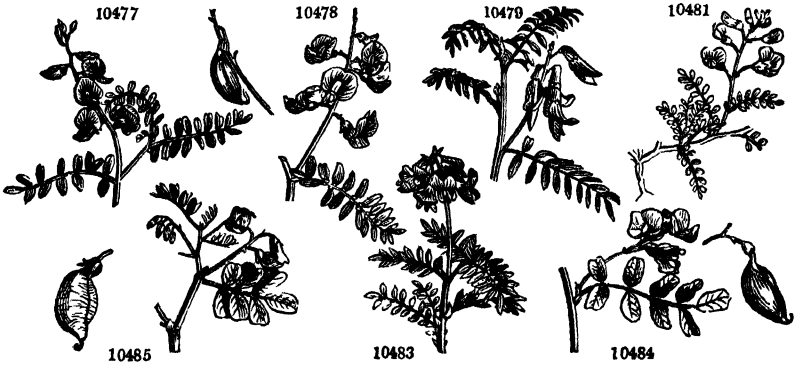
A cubic foot of acacia, in a dry state, weighs from 48 to 53 pounds avoirdupois. If we compare its toughness in an unseasoned condition with that of oak, it will not be more than 8—100 less Its stiffness is equal to 99—100 of oak; and its strength nearly 96—100; but were it properly seasoned, it might, possibly, be found much superior to oak in strength, toughness, and stiffness. A piece of unseasoned acacia, two feet six inches long, and an inch square in the vertical section, broke when loaded with a weight of 247 pounds avoirdupois. Its medium cohesive force is about 11,500 pounds (*Dict. of Archi.*)

10459 The only species

10460 Racemes with 1-fl pedicels, Leaves pinnated with an odd one, Stipules spiny, Pods smooth

10461 Racemes with 1-fl pedicels, Leaves pinnated with an odd one, Branches and pods viscid with glands
10462 Racemes with 2-fl pedicels, Cal truncate, Leaves pinnated with an odd one, Stem unarmed
10463 Petioles somewhat spiny, Leaflets lanceolate mucronate downy, Pedic. 1-flowered
10464 Racemes axillary few-flowered, Calyxes and branchlets finely bristly
10465 Racemes axillary, Leaves pinnate with an odd one, Stem hispid

10466 Pedunc. simple several, Leaves in 4 pairs, Petioles unarmed, Pods cylindrical



10467 Leaves about 4 pair, leaflets obcordate, Peduncles twin shorter than flower
10468 Pedunc simple, Leaves 4 stalked hoary terminated by a weak spine, Pods downy
10469 Pedunc. simple solitary, Leaves in about 8 pairs, Stipules spiny, Pods compressed
10470 Pedunc simple, Leaves in many pairs downy, Petioles filiform spiny, Branches villous
10471 Pedunc simple, Leaves in 2 pairs, Leafl obl lanc silky, Stipules and petioles spiny
10472 Pedunc simple, Leaves in 4 pairs, Leafl cuneate smooth, Stipules and petioles spiny
10473 Pedunc. 3-fl. Leaves in 2 pairs silky, Petioles spiny persistent, Pods bladdery
10474 Pedunc. simple, Leaves in 2 pairs, Leaflets obovate shining, Stipules and petioles spiny
10475 Pedunc. simple, Leaves about 4 somewhat petiolated terminated by a weak spine
10476 Pedunc. simple, Leaves 4 sessile

10477 Stalk of pod longer than persistent filaments
10478 Stalk of pod shorter than persistent filaments

10479 Leaflets obl blunt hoary beneath, Stem shrubby, Branches silky with down

10480 Leaflets linear emarginate smooth, Stem weak, Raceme axillary
10481 Leaflets linear emarginate hairy, Cal without bractes with black hairs
10482 Leafl obl downy, Stem erect, Racemes terminal
10483 Leaflets in 7 pairs ovate acute smoothish, Racemes axillary subcapitate 1-sided

10484 Leaflets ellipt retuse, Prominences of the standard short
10485 Leaflets obcordate glaucous, Pedunc about 6-flowered, Pods closed at end
10486 Leafl obovate emarginate glauc Prom of standard blunt very small, Pods open at end
10487 Leafl roundish ellipt. very blunt mucronate, Prom of standard long ascending, Stem shrubby

and Miscellaneous Particulars

R. hispida is a very handsome shrub, but it requires a sheltered situation, otherwise the branches are very liable to be shattered or blown off by high winds In young trees grafted above ground, the fracture commonly takes place at the graft, so that a good preventative is to graft on the root a little below the surface. Grafts in this manner are also much more certain of success

R viscosa resembles, in its leaves and flowers, the common acacia; but is, altogether, a much handsomer tree.

1569 *Caragana* This genus has been confounded by Linnæus and his followers with Robinia The name is derived from the appellation of the most common species in Tartary, where it is called among the Moguls, *Carachanâ* Altagana, the name of another species, is in like manner a slight alteration of the Tartar name Aldachanâ.

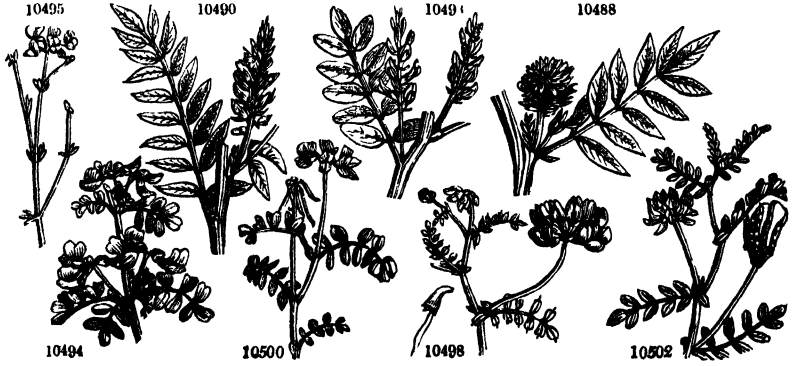
C spinosa, on account of the length and toughness of the branches, and its large stout thorns, is admirably adapted to form impenetrable hedges, and is sufficiently hardy to bear our climate About Pekin, they stick the bushes in clay on the tops of their walls, to prevent persons from getting or looking over them. (*Pallas*)

C. Halodendron is a handsome shrub, and grows in Siberia on dry naked salt-fields, and it is probably from the want of this principle in our garden soils, that it so seldom flowers here

C. pygmæa is a weak low shrub, with a shining yellow bark, with wood of a deep bay, almost as hard as horn

C frutescens is used by the Tartars for the same purposes as osiers, for which its tough shoots render it proper.

C. jubata is remrakable plant, its shoots always remaining covered by the persistent brown stipulæ of the fallen leaves. It is extremely difficult to propagate, and is rarely even seen in this country The most successful cultivators of it are Messrs Loddiges and Son



1570. *Swainsona* Named after the late Mr Isaac Swainson, who had a botanic garden at Twickenham.

1571 *Sutherlandia.* In honor of Mr James Sutherland, who published, in 1683, an 8vo catalogue of the Physic Garden at Edinburgh This and the former genus seed freely, and may also be readily increased by cuttings.

1572 *Lessertia.* Named by Decandolle in honor of M. Stephen Delessert, to whose mother Rousseau's Letters on Botany were addressed

1573 *Colutea.* An ancient name of a bush with sweet-scented flowers, probably similar to the genus now

History, Use, Propagation, Culture,

so called Shrubs with membranaceous inflated pods, free-growers and flowerers, well adapted to introduce in extensive shrubberies

C arborescens grows on Mount Vesuvius, even in the ascent to the crater, where there are scarcely any other plants The leaves are recommended as answering all the purposes of senna, and Allioni has given particular directions for the preparation of them A larger dose seems to be required to produce the same effect. The seeds, in a quantity of a drachm or two, excite vomiting. It is said by Haller and Ray to afford food grateful to cattle

1574 *Glycyrrhiza* From γλυκυς, sweet, and ῥιζα, a root, the sweet taste of the liquorice root is well known. But the species from which the name is derived now constitutes a different genus See Liquiritia.

1575 *Liquoritia* A Latinized appearance of our common English word *Liquorice*, which in its turn is said to be an alteration or corruption of the French word *Reglisse*, itself a corruption of *Glycyrrhiza* So, at least, says De Theis. To others, however, it is appears more probable that the name alludes to the quantity of *liquor* or *liquid* which the roots contain, and which constitutes their great value

L. officinalis is a deep-rooting perennial, which has long been much cultivated in Spain; and since Elizabeth's time has been grown in different parts of England The soil should be a deep sandy loam, trenched by the spade or plough, or with the aid of both, to two and a half or three feet in depth, and manured, if necessary The plants are procured from old plantations, and consist of the side-roots, which have eyes or buds. These may be taken off, either in autumn, when a crop of liquorice is taken up for use, and laid in earth till spring; or taken from a growing plantation, as wanted for planting. The planting season may be either October, or February and March. In general the latter is preferred. The plants are dibbled in, in rows three feet apart, and from eighteen inches to two feet in the row, according to the richness of the soil. The after-culture consists in horse-hoeing and deep stirring, in weeding, and in cutting over and carrying away the haulm every autumn, after it is completely withered As the plants do not rise above a foot the first season, a crop of onions or beans is sometimes taken in the intervals The plants must have three summers' growth, at the

10488 Pods echinate, Fl. capitate, Stipules lanc. Leaflets smooth oblong mucronate
10489 Pods glandular echinate, Fl. racemose, Stipules withering, Leafl. oblong lanc. emarg. clammy beneath
10490 Leaflets oblong acute silky, Pods racemose oblong hispid
10491 Pods smooth moniliform, Raceme term Stipules lanc. Leafl obovate emarg. rough beneath
10492 Pods hirsute, Leafl. obl. lanc. Flowers racemose

10493 Pods smooth, Stipules O, Leaflets ovate retuse clammy beneath

10494 Pedunc. about 3-fl. Claws of cor three times as long as calyx, Stem angular
10495 Leaves 5-nate and 3-nate linear lanceolate fleshy blunt
10496 Leaflets about 9, Stipules nearly round
10497 Leaflets 7 very blunt, Stipules lanceolate
10498 Leaflets 6-10 pair more or less obovate and retuse, Pods very long curved upwards
10499 Leaflets 9 ellipt. : inner close to stem, Stipules opp the leaves lanceolate
10500 Procumbent, Leafl. 9 ovate, Stipule opp the leaf emarg Pods angular knotty

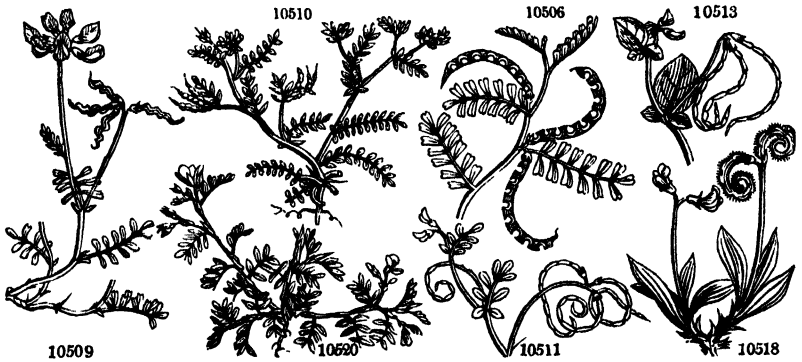
10504 Leaflets several obl. cuneate, Pods compressed ensiform
10505 Leaflets 9 very blunt somewhat emarginate, Stipules round toothletted



10506 Pods sessile solitary erect
10507 Pods stalked clustered circular lobed on one edge
10508 Pods stalked clustered smooth lobed on the outer edge, Leaves and cal hairy
10509 Pods stalked clustered arcuate rough sinuated on one side

10510 Leaves pinnated, Flowers capitate with a bractea, Pods roundish incurved
10511 Leaves pinnated, Flowers capitate without a bractea, Pods round incurved

10512 Leaves pinnated, Flowers capitate with a bractea, Pods compressed recurved rugose
10513 Leaves ternate subsessile the odd one very large
10514 Leaves ternate or quinate the odd one largest, Stipules large membranous 2-toothed
10515 Leaves pinnated, Pods rugose pendulous scarcely bowed, Joints compressed roundish

10516 Pedunc 1-fl Pods covered over with blunt scales
10517 Pedunc. 2-fl Pods bluntly aculeate outwardly
10518 Pedunc about 3-fl Pods bearing outwardly distinct acute spines
10519 Pedunc. about 4-fl. Pods bearing outwardly clustered acute spines

10520 Lips of calyx entire, Racemes stalked few-flowered

and Miscellaneous Particulars

end of which the roots may be taken up by trenching over the ground The roots are either immediately sold to the brewers' druggists, or to common druggists, or preserved, like carrots or potatoes, in sand, till wanted for use. They are used in medicine and porter-brewing

1576 *Coronilla.* From *corona*, a crown Its pretty flowers are disposed in little tufts like coronets. Handsome free-flowering shrubs, of easy culture. C valentina, glauca, and viminalis are valuable as flowering in winter, and often all the summer. C argentea bears a profusion of flowers, which have a strong sweet scent. The silvery color of this plant is occasioned by its growing on a poor dry soil, and if it is removed into better ground, it will take a glaucous color, and the contrary. C. emerus is a popular shrub of much beauty

C varia is a strong coarse-growing plant, and has been grown as an adjunct to clover, lucern, &c. Curtis says, it is bitter, but others have found horses and cows to eat it greedily.

1577 *Hippocrepis* From ἵππος, an horse, and κρηπις, a shoe, in allusion to the form of its pod. Pretty little annual plants, with bright yellow flowers

1578 *Ornithopus.* From ὄρνις, a bird, and πους, a foot The pods are twisted and curved in such a manner as to resemble the claws of a small bird. Curious on account of their jointed pods, but not worth culture as plants of ornament O sativus is a most valuable agricultural plant. It was introduced for purposes of field culture about the year 1818, from Portugal, under the name of Serradilla. Sown upon the barren, light, sandy downs of Thetford, in Norfolk, it produced an abundant crop of most excellent fodder, where nothing else would grow. It is exceedingly like O. scorpioides, except that it arrives at the height of two feet instead of as many inches.

1579. *Scorpiurus.* From σκορπιος, a scorpion, and ουρα, a tail; on account of the twisted pod, which is very like the tail of some reptile.

1580. *Smithia.* In memory of Sir James Edward Smith, M. D., F. R. S., knight, president of the Linnean Society, possessor of the Linnean herbarium, and author of various elementary and other useful botanical works. These are inconspicuous worthless weeds, possessing little interest beyond their irritable foliage.

History, Use, Propagation, Culture,

1581 *Sesbania* The Arabic name *Sesban*, a little Latinized. Most of these plants are ornamental. S. grandiflora is a beautiful plant, it grows in peat and loam, and cuttings root in sand under a hand-glass

1582 *Æschynomene* A name given by Pliny to a plant which withdrew its leaves from the contact of the hand. It is derived from αισχυνομαι, to be modest. One of the species of Æschynomene is sensitive, but it is not the plant of Pliny

1583 *Stylosanthes* From στυλος, a style, and ανθος, a flower· a flower with a very long style Worthless tropical weeds

1584 *Hallia.* Named after Birger Martin Hale, a pupil of Linnæus, and the student under whose name the thesis called Nectaria florum stands in the Amœnitates Academicæ

1585. *Lespedeza* Named by Michaux, in honor of Lespedez, a governor of Florida, who protected that botanist in his botanical researches Herbaceous, chiefly North American plants with little merit.

1586. *Flemingia.* Named after Dr John Fleming, president of the East India Company's Medical Board at Bengal.

1587 *Zornia.* Supposed to have been named after Mr John Zorn, an apothecary at Kempten, in Bavaria, author of a work called Icones Plantarum Medicinalium, in five volumes, octavo, between the years 1779 and 1784 There was also a Dr Bartholomew Zorn, of Berlin, author of Botanologia Medica, 1714, &c. &c.

1588. *Hedysarum.* From ἡδυς, sweet, and αρωμα, smell, some the species have fragrant flowers. A

10521 Racemes about 3-fl. Leafl obl. emarg smooth, Pods filiform straight compressed
10522 Racemes many-fl Leafl lin blunt mucronate, Rachis of leaves smooth, Pods filiform round
10523 Racemes few-fl Leafl linear blunt mucronate, Rachis of leaves prickly, Pods filiform round
10524 Pedunc 1-fl Leafl lin blunt mucronate, Rachis of leaves smooth
10525 Racemes many-fl pendulous, Leafl lin. blunt, Pods filiform round moniliform

10526 Stem smooth, Leafl. lin blunt, Racemes few-flowered, Pods smooth
10527 Stem rough below, Leafl lin blunt, Racemes comp hispid, Joints of pod rough in middle
10528 Stem hispid, Leafl lin blunt, Racemes simple, Pods hispid
10529 Stem hispid, Leafl lin falcate acuminate, Racemes simple, Joints of pods roundish distinct smooth
10530 Stem smooth, Pods smooth torose on one side and blunt, Leaflets blunt

10531 Leaves ovate lanc. smooth, Spikes many-fl. Bractes smooth mucronate, Stem downy

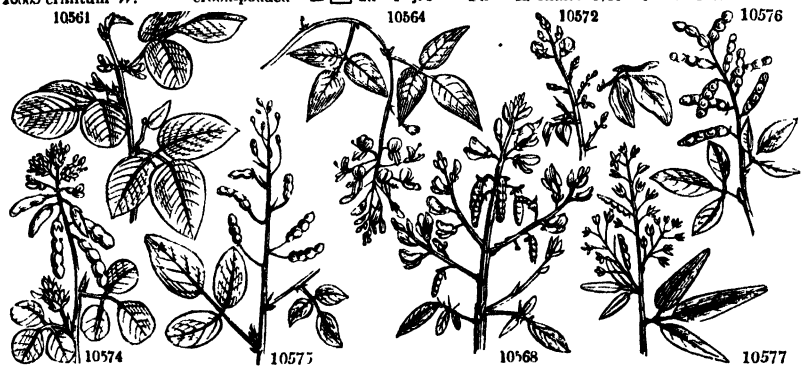
10532 Leaves lanc mucronate smooth, Pedunc 1-fl the length of leaves
10533 Leaves cordate obl acute smooth, Pedunc the length of leaves
10534 Leaves cordate ovate convolute imbricated, Flowers axillary sessile

10535 Leafl. subovate villous beneath, Flowers in sessile fascles, Stem shrubby
10536 Leafl oblong, Fascles of flowers sessile numerous, Pods nearly naked acute
10537 Leafl somewhat lin hairy beneath, Racemes axillary, Pods smooth length of calyx
10538 Simple, Leafl. ellipt Spikes capitate on short stalks axillary and terminal, Cal vill length of cor
10539 Branched villous, Leafl round oval, Spikes axillary on long stalks, Cor as long as calyx
10540 Branched diffuse, Leafl ellipt blunt hairy beneath, Racemes short umbelled
10541 Leaves ternate ovate, Racemes oblong, Pods inflexed, Calyx hairy

10542 Stem subsimple upright, Leafl broad lanc smooth, Racemes axill sol length of petiole
10543 Branched nearly upright, Leafl. ellipt smooth, Petioles winged, Racemes panicled term. and axillary
10544 Nearly erect, Leafl. broad-lanc Racemes axillary clustered
10545 Somewhat branched, Leafl obovate, Petioles winged, Racemes clustered, Pods gland viscid
10546 Erect branched, Leafl obovate cuneate, Racemes axill on long stalks dichotomous
10547 Leaves simple, Spikes like cones, Bractes cucullate foliaceous netted

10548 Leaves ternate large, Bractes numerous orbicular lined
10549 Leaves binate ovate-lanc. Bractes ovate acute

10550 Leaves simple lanc. blunt, Stem spiny
10551 Leaves simple lanc acute, Stem unarmed, Stipules scarious
10552 Leaves simple obovate roundish, Stipules scarious shorter than petiole, Pods smooth netted
10553 Leaves simple cordate-roundish blunt smooth above downy beneath
10554 Leaves simple ovate acute with stipules
10555 Leaves simple cordate oblong stalked winged, Branches 3-cornered
10556 Leaves simple ovate blunt
10557 Leaves simple cordate oblong, Petioles simple, Stipules sheathing
10558 Leaves simple cordate lanc sagittate, Flowers solitary, Pedunc capillary very long
10559 Leaves simple and ternate intermediate 2-lobed lobes spreading lanc Joints of pod wavy plaited



and Miscellaneous Particulars

numerous genus, not remarkable for beauty, but containing two curious species, the manna plant, and the turning Hedysarum; and one of considerable importance in European agriculture, the Saint-foin

H. Alhagi is a thorny shrub, with lanceolate leaves, and coriaceous, subcylindric, and scarcely jointed pods It is on this plant that Manna Trungebeen is found in Mesopotamia (*Russ. Alepp*) and other eastern countries. It is chiefly gathered about Tauris, where the shrub grows plentifully. Sir George Wheeler found it growing in Tinos, Tournefort also found it in many plains of Armenia and Georgia, and made a distinct genus of it, under the name of Alhagi, from the Arabic *Aghul* or *Al-gul*

H. gyrans is a native of Bengal near the Ganges, and is called there *Buram Chadals*, or *Burram Chandals* This is a wonderful plant, Linnæus observes, on account of its voluntary motion, which is not occasioned by any touch, irritation, or movement in the air, as in Mimosa, Oxalis, and Dionæa, nor is it so evanescent as in Amorpha. No sooner had the plants raised from seed acquired their ternate leaves, than they began to be in motion this way and that, this movement did not cease during the whole course of their vegetation, nor were they observant of any time, order or direction; one leaflet frequently revolved, whilst the other on the same petiole was quiescent, sometimes a few leaflets only were in motion, then almost all of them would be in movement at once. the whole plant was very seldom agitated, and that only during the first year It continued to move in the stove during the second year of its growth, and was not at rest even in winter (*Supp. Linn*) Swartz observes, that the motion is irregular, and that it sometimes ceases entirely, that in a very hot day it is immoveable, being agitated only in the evening, and that slowly. In our climate, the leaves, in

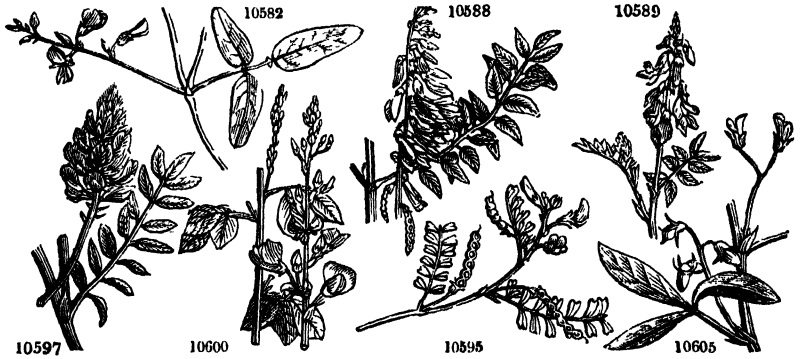
History, Use, Propagation, Culture,

general, only make a faint and feeble attempt towards the middle of the day at exerting their extraordinary faculty (*Shaw*)



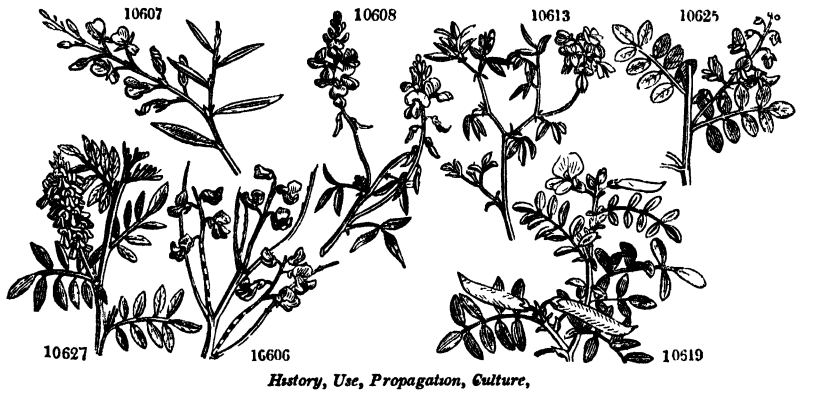
This motion does not depend upon any external cause that we can trace, and we are not able to excite it by any art that we possess It is not the action of the sun's rays, for this plant is fond of shade, and the leaves revolve well on rainy days, and during the night · exposed to too much wind or sun, it is quiet Perhaps, says Linnæus, there may be some part in vegetables, as in animals, where the cause of motion resides

H. coronarium, *Sulla*, or *Sainfoin à bouquets*, Fr, is an esteemed border biennial, and some speculative agriculturists recommend it for cultivation as a field plant In Calabria it grows wild in great luxuriance, near four feet high, affording excellent nourishment to horses and mules, both green and made into hay: but it does not well bear the spring in the north of Italy: we may presume, therefore, that it will scarcely bear our climate well enough to answer the purposes of husbandry. Osbeck mentions, that he saw it brought into Cadiz in great bundles, as food for cattle.

H. Onobrychis, *L'esparcet*, Fr, *Esparzette*, Ger, and *Cedrangolo*, Ital, is a deep rooting perennial, with branching spreading stems, compound leaves, and shewy red flowers It is a native of many parts of Europe, but never found but on dry warm chalky soils, where it is of great duration. It has been long cultivated in France, and in other parts of the continent, and as an agricultural plant, a good deal in England, in the chalky districts, and its peculiar value is, that it may be grown on soils unfit for being constantly under tillage, and which would yield little undergrass This is owing to the long and descending roots of the saint-foin, which will penetrate and thrive in the fissures of rocky and chalky understrata. Its herbage is said to be equally suited for pasturage or for hay, and eaten green it is not so apt to swell or hove cattle as the clovers or lucern. Arthur Young says, that upon soils proper for this grass no farmer can sow too much of it, and in

10560 Leaves ternate downy beneath, Stem angular downy, Racemes axillary
10561 Leaves ternate roundish ovate and branches 3-cornered hairy, Pedunc umb. axill. shorter than petiole
10562 Leaves ternate oblong, Stem branched, Raceme terminal, Pods with 2 joints strigose
10563 Leaves simple reniform cordate repand, Racemes axillary with hooked hairs
10564 Leaves ternate ovate villous, Stem climbing, Racemes terminal
10565 Leafl. roundish hairy beneath, Panic. term contracted bracteate, Pedunc. and cal. very hairy
10566 Leaves tern. Stem hairy rough, Leafl. roundish and obl. pale beneath somew. hairy, Racemes terminal
10567 Leaves tern obl. subcordate pale and soft beneath, Raceme terminal
10568 Leaves tern. oval-lanc blunt: lateral very minute, Panicle terminal, Pods repand below pendulous
10569 Leaves tern. ovate acute hairy, Stem climbing 3-cornered, Racemes very long axillary
10570 Leaves tern. obl. lanc. Stipules filiform, Fl racemose, Pods hispid
10571 Leaves tern. roundish downy beneath, Stipules ovate acuminate, Stem angul. cil hispid
10572 Leaves tern oblong villous beneath, Stipules subulate, Racemes panicled, Pods with 3 joints
10573 Leaves tern ovate blunt subcordate at base, Stipules lanc. subulate, Panicle terminal
10574 Leaves tern roundish obovate downy beneath, Stipules lanc. Racemes axillary
10575 Leaves tern ovate-obl blunt smoothish, Racemes erect axillary, Pods tortuous
10576 Leaves tern ovate-obl rough beneath, Stip. lanc cuspid. Racemes panicled with bractes
10577 Leaves tern oblong lanc. smooth, Panic term Joints of pod rhomboid downy
10578 Leaves tern. ovate acute, Raceme term. very long, Pods repand villous
10579 Leaves tern ovate acum. Panicle term. Joints of pod netted downy at edge
10580 Leaves tern. roundish ovate acuminate, Panicle scape-like from the base of stem, Peduncles viscid
10581 Leaves tern ellipt. blunt beneath and petioles hirsute, Raceme term simple
10582 Leaves tern obcordate, Stem procumb Pedunc 1-fl axillary, Pods with upper edge repand
10583 Leaves tern lanc. blunt, Racemes axillary, Stem twining
10584 Leaves pinnate lanc Raceme very long spiked, Joints of pod ellipt. plaited
10585 Leaves pinnate oval broader at base silky beneath, Cal shorter than corolla, Joints of pod downy rough
10586 Leaves pinnate, Leafl ellipt blunt downy beneath alternate, Joints of pod netted
10587 Leaves pinn Leafl altern smooth obovate retuse, Racemes axill few-fl
10588 Leaves pinn ovate lanc smooth, Racemes long axill Bractes shorter than peduncle
10589 Leaves pinn ovate smooth, Racemes axill Bractes longer than peduncle
10590 Leaves pinn. lanc linear downy beneath, Joints of pod roundish roughish
10591 Leaves pinn in 7 pairs ellipt Racemes capitate axillary stalked, Standard striped
10592 Leaves pinn roundish ellipt Joints of pod roundish aculeate naked
10593 Leaves pinn oblong, Pods flexuose, Joints prickly
10594 Leaves pinn linear cuneiform, Wings very short, Joints of pod roundish hairy prickly
10595 Leaves pinn obovate emarg hispid at edge, Raceme term Pods with many joints muricated
10596 Leaves pinn obovate emarg Flowers in capitate racemes, Joints of pod round villous acuminate
10597 Leaves pinn cuneate smooth, Wings as long as calyx, Pods smooth 1-seeded prickly
10598 Leaves pinn linear smooth, Wings shorter than calyx, Pods smooth 1-seeded prickly
10599 Leaves pinn. linear silky beneath, Wings shorter than cal Pods downy 1-seeded prickly-toothed
10600 Leaves ternate roundish downy beneath, Stem round, Branches declinate ascending hairy

10601 Leaves pinnate ellipt silky, Cal as long as wings, Joints of pod villous
10602 Leaves pinnate silky shining roundish ovate, Cal length of corolla, Joints of pod rugose downy
10603 Leaves pinnate obl smooth, Wings shorter than cal Pods 1-seeded prickly, Teeth of crest subulate
10604 Leaves pinnate obl smooth, Petals nearly equal, Pods 1-seeded prickly, Teeth of crest lanceolate
10605 Leaves pinnate, Racemes long, Pods inflexed



and Miscellaneous Particulars

The Code of Agriculture, it is said to be "one of the most valuable herbage plants we owe to the bounty of providence."

The deeper the soil is stirred previously to sowing the better, the seed is generally put in broad cast, at the rate of three or four bushels the acre, and sometimes a little red clover is sown afterwards to produce a crop the second season, when the saint-foin plants are but small When saint-foin is annually mown, it should be top-dressed with manure, but if only occasionally mown, the benefits derived from the grazing of sheep or cattle will, to a considerable extent, answer for surface dressings in a plant that derives a part of its nutriment from the subsoil. Saint-foin is highly nutritive, either cut green or made into hay The produce, on a medium of soils and cultivation, may probably be estimated at from about one and a half to two tons the acre And on the poorer and thinner staple sorts of land, it will perhaps seldom afford less than from a ton to a ton and a half on the acre. One thousand parts of saint-foin afforded Sir H. Davy thirty-nine of nutritive matter, which is the same as that afforded by the red and white clover.

The usual duration of saint-foin, in a profitable state, is from eight to ten years. It usually attains its perfect growth in about three years, and begins to decline towards the eighth or tenth on calcareous soils, and about the seventh and eighth on gravels There are instances, however, of fields of saint-foin, which had been neglected and left to run into pasture, in which plants have been found upwards of fifty years from the time of sowing. It has been cultivated upwards of a century on the Cotswold hills, and there roots of it have been traced down into stone quarries from ten to twenty feet in length, and in Germany, Von Thaer found them attain the length of sixteen feet. In general, the great enemy to the endurance of saint-foin, is the grass which accumulates, and forms a close turf on the surface, and thus chokes up the plant.

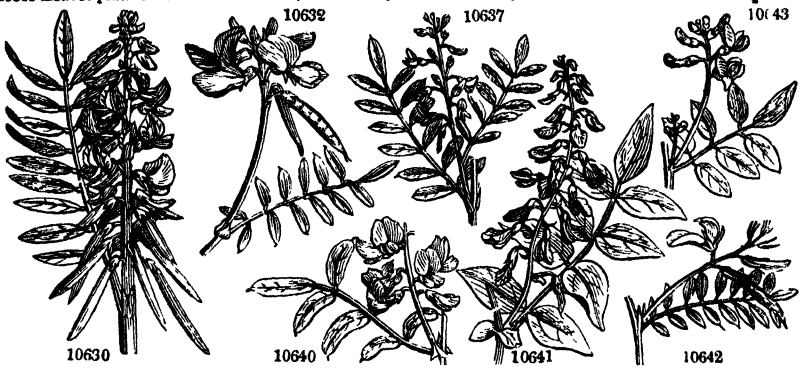
History, Use, Propagation, Culture,

1589 *Indigofera.* That is to say, a plant bearing *indigo* The species are elegant little shrubs, free-flowerers, and of easy culture Most of them will yield the dye, but those chiefly cultivated for this purpose are the I Anil (*Alnyl*, Arab.), in the West Indies, and the I tinctoria, argentea, and some other species in the East Indies The indigo is one of the most profitable articles of culture in Hindustan, because an immense extent of land is required to produce but a moderate bulk of the dye, because labor and land here are cheaper than any where else, and because the raising of the plant and its manufacture may be carried on without even the aid of a house The first step in the culture of the plant is to render the ground, which should be friable and rich, perfectly free from weeds, and dry if naturally moist The seeds are then sown in shallow drills about a foot apart The rainy season must be chosen for sowing, otherwise if the seed is deposited in dry soil, it heats, corrupts, and is lost. The crop being kept clear of weeds, is fit for cutting in two or three months, and this may be repeated in rainy seasons every six weeks The plants must not be allowed to come into flower, as the leaves in that case become dry and hard, and the indigo produced is of less value, nor must they be cut in dry weather, as they would not spring again A crop generally lasts two years. Being cut, the herb is first steeped in a vat till it has become macerated and parted with its coloring matter; then the liquor is let of into another, in which it undergoes the peculiar process of beating, to cause the fecula to separate from the water This fecula is let off into a third vat, where it remains some time, and is then strained through cloth bags, and evaporated in shallow wooden boxes placed in the shade Before it is perfectly dry, it is cut in small pieces of an inch square, it is then packed in barrels, or sowed up in sacks for sale. Indigo was not extensively cultivated in India before the British settlements were formed there, its profits were at first so considerable, that, as in similar cases, its culture was carried too far, and the market glutted with the commodity The indigo is one of the most precarious of oriental crops, being liable to be destroyed by hail storms, which do comparatively little injury to the sugar-cane and other plants.



The indigo cultivated in the West Indies, thrives best in a free rich soil, and a warm situation, frequently refreshed with moisture. Having first chosen a proper piece of ground, and cleared it, hoe it into little

10606 **Leaves simple filiform, Flowers racemose**
10607 **Leaves simple linear hoary, Pods globose**
10608 **Leaves ternate lanc. silky beneath, Racemes longer than leaf, Pods pendulous**
10609 **Leaves ternate lin lanc. silky beneath, Racemes longer than leaf few-fl. Pods straight**
10610 **Leaves ternate oblong downy beneath, Racemes longer than leaf, Pods reflexed appressed**
10611 **Leaves ternate obovate silky beneath, Raceme term long, Stem decumbent**
10612 **Leaves ternate, Leafl ovate mucronate sessile, Pedunc axill about 2-fl. Branches filiform spreading**
10613 **Leaves ternate obcordate smooth, Racemes longer than leaf, Pods pendulous**
10614 **Leaves ternate ovate acute, Racemes short, Stem erect**
10615 **Leaves ternate obovate on short stalks, Pedunc. long filiform, Pods pendulous**
10616 **Leaves quinate obovate mucronate hairy, Stipules subulate, Pods straight smooth**
10617 **Leaves pinnate cuneate 7, Racemes as long as leaves, Pods 4-cornered 2-seeded**
10618 **Leaves pinnate 5 or 7 oblong narrowed at each end, Racemes longer than leaf**
10619 **Leaves pinnate 7 or 9 oblong downy beneath, Racemes about 5-flowered sessile, Stem straight**
10620 **Leaves pinnate of 4 or 5 pairs hoary beneath, Racemes length of leaves spiked, Pods 4-cornered villous**
10621 **Leaves pinnate linear, Racemes axillary, Stem shrubby downy**
10622 **Leaves pinnate smooth of many pairs oblong, Racemes shorter than leaf, Standard smooth**
10623 **Leaves pinnate of 6 pairs obovate strigose, Racemes shorter than leaf, Pods pendulous, Stem viscid**
10624 **Leaves pinnate oblong of 3 pairs, Racemes shorter than leaf, Pods falcate**
10625 **Leaves pinnated obl smooth of 4 pairs, Racemes shorter than leaf, Pods round arcuate**
10626 **Leaves simple ternate and pinnate silky, Pods torulose pendulous**
10627 **Leaves pinn obl smooth, Racemes spiked shorter than leaf, Pods 4-cornered reflexed**
10628 **Stem muricate downy, Leafl oval hairy, Stip oval acute, Racemes longer than leaves**
10629 **Leaves about 3, Leafl.** lanc. blunt mucronulate smooth deciduous, **Petioles persistent**

10630 **Leafl.** obl. lanc. blunt downy beneath, Raceme terminal long, Pods round spreading
10631 **Pods falcate backwards compressed villous spiked, Calyxes woolly, Leafl oval-obl acuminate**
10632 **Leafl.** obl mucronate downy beneath, Stip ovate acuminate, Raceme 4-fl terminal, Pods pendulous
10633 **Leafl** cuneate-obl. recurved mucronate villous beneath, Stipules subulate, Raceme few-fl
10634 **Pods straight spreading ciliated, Stip subulate, Leafl 9-11 obl acute downy beneath**
10635 **Leafl** lanc cuneate retuse silky beneath, Stip setaceous, Pods falcate backwards villous pendulous
10636 **Pods straight ascending villous, Stip subulate, Pedunc 2-edged, Leafl obl blunt**
10637 **Leafl** obl cuneate emarg mucronate smooth, Stip subulate, Pods racemose straight ascending
10638 **Leafl.** inversely lanc obtuse emarg silky beneath, Racemes terminal short
10639 **Leafl.** inversely lanc. emarg mucronate hairy, Stip subulate, Racemes terminal

10640 **Leafl.** lanc. mucronate smooth, Stip lanc. sagittate, Pods erect straignt

10641 **Leafl** ovate acuminate smooth, Stip ovate, Flowers cernuous
10642 **Leafl.** obl acute downy beneath, Stip subulate, Pods smooth racemose pendulous
10643 **Leafl** ovate acute downy, Stip subulate, Pods straight pendulous smooth racemose
10644 **Leaves pinn** ovate mucron villous, Stem erect, Branches downy

and Miscellaneous Particulars.

trenches, not above two inches, or two inches and a half in depth, not more than fourteen or fifteen inches asunder In the bottom of these, at any season of the year, strew the seeds pretty thick, and immediately cover them. As the plants shoot, they should be frequently weeded, and kept constantly clean, until they spread sufficiently to cover the ground Those who cultivate great quantities, only strew the seeds pretty thick in little shallow pits, hoed up irregularly, but generally within four, five, or six inches of one another, and covered as before Plants raised in this manner, are observed to answer as well, or rather better, than the others, but they require more care in the weeding They grow to full perfection in two or three months, and are observed to answer best when cut in full blossom The plants are cut with reaping hooks, a few inches above the root, tied in loads, carried to the works, and laid by strata in the steeper Seventeen negroes are sufficient to manage twenty acres of indigo, and one acre of rich land, well planted, will, with good seasons and proper management, yield five hundred pounds of indigo in twelve months, for the plant ratoons (i e. it sends out stolones), and gives four or five crops a year, but must be replanted afterwards.

Indigo has long been cultivated in Spain, but is on the decline in that country, owing to the more favorable circumstances of the East and West Indies. It was tried in the south of France and Italy, during the Buonaparte dynasty, but found not worth following for the same reason

1590 *Tephrosia* From τεφρος, ash-colored, in allusion to the color of the foliage T toxicaria is a spreading shrubby plant The leaves and branches, well pounded, and thrown into a river or pond, very soon affect the water, and intoxicate the fish, so as to make them float on the surface, as if dead, most of the large ones recover after a short time, but the greatest part of the small fry perish on these occasions. It has been introduced to Jamaica, and cultivated there, on account of its intoxicating qualities. (*Browne*)

1591. *Galega.* A name of unexplained meaning. Ruellius says, it is the word *Glaux*, Italianized! G officinalis was formerly accounted cordial and sudorific, but is now out of repute. The species are handsome border flowers.

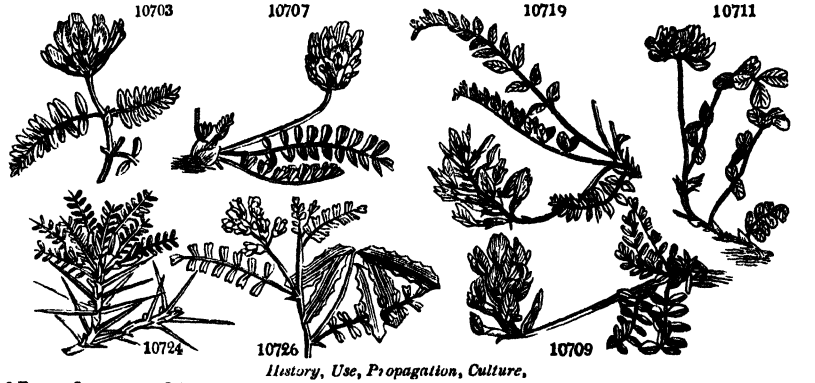
10647 Erect branched downy, Leafl. in many pairs obl. lanc blunt, Pods half ovate acute
10648 Branched ascending, Leafl. about 17 lanc. · the odd one subsessile, Alæ bifid
10649 Branched ascending smooth, Leafl. about 11 lin.-lanc · the odd one subsess. Pods obovate inflated erect
10650 Caulescent procumb. Fl pendulous racemose, Pods acute at each end hairy

10651 Stemless villous, Pods erect roundish-obl. villous acuminate with style half 2-celled
10652 Stemless silky, Leafl. 19 lanc ellipt acute at each end, Spikes capitate
10653 Stemless villous silky, Pods erect ovate cylindr inflated 2-celled
10654 Stemless, Leafl. lanc silky, Scape longer than leaf and calyxes silky, Heads few-fl cernuous

10655 Stemless, Calyx and pods villous, Leafl lanc acute, Stem decumbent
10656 Stemless, Pods subulate hooked longer than leaf, Leafl obcordate
10657 Stemless, Leafl lanc smooth, Scapes as long as leaves hairy, Flowers in obl. heads
10658 Stemless, Leafl cuneiform retuse subsessile, Pods smooth, Flowers nearly apetalous
10659 Caulescent erect hairy, Leafl lanc acute, Spikes stalked longer than leaf, Pods subulate hairy
10660 Caulescent erect hairy, Leafl 3-pair lanc acute, Stip obl. acun Spikes stalked longer than leaf
10661 Caulescent ascending, Leafl ovate lanc deflexed hairy, Spikes stalked longer than leaf
10662 Caulescent diffuse downy, Stipules united, Wings emarg Peduncles as long as leaf

10663 Caulescent erect, Leafl ellipt. stalked, Stip lin subulate, Pedunc about 3-fl axill clustered
10664 Caulescent erect, Leafl roundish cordate sessile downy, Stip ovate acuminate, Pedunc 1-fl axill
10665 Caulescent erect, Spikes cylindrical subsessile, Cal and pods woolly
10666 Caulescent erect, Heads of flowers stalked globose, Pods 4-seeded inclosed in woolly calyx
10667 Caulescent erect, Heads of flowers sessile axill short, Corolla larger than calyx
10668 Caulescent erect, Heads globose, Pedunc very long, Leafl emarginate
10669 Caulescent erect striated, Leafl lin lanc smooth, Stip lanc Racemes longer than leaf
10670 Caulescent erect panicled, Leaves of 2 or 3 pair linear cuneate retuse smooth, Racemes filiform
10671 Caulescent erect shrubby, Leaves in 6 pairs lin lanc hoary, Racemes long spiked
10672 Caulescent erect, Leafl linear lanc Spikes obl stalked longer than leaf, Standard twice as long as alæ
10673 Caulescent erect rough, Leafl lin lanc Spikes stalked longer than leaves straight, Pods 3-cornered
10674 Caulescent erect straight smooth, Leafl ellipt blunt, Fl racemose pendulous, Pods 3-cornered smooth
10675 Caulescent erect straight smooth, Leafl ellipt. blunt, Fl racemose pendulous, Pods inflated rugose
10676 Caulescent erect smooth, Leafl lanc acute, Racemes longer than leaf, Pods falc acute pendulous
10677 Caulescent erect, Peduncles as long as leaves, Leaflets 33-41, Pods about 3-cornered arcuate
10678 Caulescent erect, Leafl obl downy, Spikes stalked, Bractes obl length of calyx
10679 Caulescent erect, Leafl obl downy beneath, Spikes stalked, Bractes lanc length of peduncle
10680 Caulescent diffuse, Pods subcylindrical mucronate, Leafl naked beneath
10681 Pedunc. as long as leaves, Leafl 33-41 scarcely downy, Pods 3-cornered bowed nodding
10682 Pedunc as long as lvs. Leafl smoothish obl blunt mucro Stip lanc Racemes stalked longer than leaf
10683 Pedunc. as long as lvs. silky-white, Leafl 21 ellipt smooth above, Spikes subsessile, Pods fleshy
10684 Pedunc. longer than leaf, Fl erect closely spiked, Pods half 2-celled
10685 Caulescent prostrate, Leafl smooth ovate mucronate blunt, Stip. ovate-lanceolate
10686 Caulescent erect spread Leafl ov hairy, Stip solitary opp the lvs 2-parted, Spikes stalked long than leaf
10687 Caulescent, Scapes 2-fl Pods hooked subulate with 2-keels
10688 Caulescent prostrate, Leafl ellipt cuneate emarg Racemes few-fl Peduncles longer than leaf
10689 Caulescent procumbent, Leafl cuneate emarg Stip ov Racemes few-fl stalked shorter than leaf
10690 Caulescent erect, Leafl. obl retuse, Fl axill sol subsessile, Pods deeply channelled
10691 Caulescent procumbent downy, Leafl obovate emarg Racemes stalked arcuate twisted
10692 Caulesc procumb Leafl obl. blunt mucro Spikes stalked few-fl shorter than lvs. Pods obl. hooked at end
10693 Caulescent diffuse, Heads stalked lateral, Pods straight subulate mucronate
10694 Caulescent difluse, Leafl ellipt emarg Racemes few-fl stalked shorter than leaf, Pods hooked
10695 Stemless, Leaves ellipt downy, Scapes racemose longer than leaf, Pods obovate the length of calyx
10696 Caulescent, Leaflets oval-oblong or obovate smooth, Stipules very large leafy
10697 Stem decumb Leafl obl downy, Pedunc axill few-fl Pods arcuate with elevated veins
10698 Stemless, Leafl subulate 4 whorled pilose, Scapes spiked longer than leaf, Lower flowers remote
10699 Caulescent diffuse, Heads subsessile lateral, Pods erect subulate with a reflexed point
10700 Caulescent diffuse, Pods subulate incurved smooth, Leafl. obovate
10701 Caulescent procumb Leafl obl. retuse, Heads stalked shorter than leaf, Pods half ovate squamose at end
10702 Caulescent procumb Leafl lin narrowed at base, Heads subsessile, Pods half ovate reflexed downy



and Miscellaneous Particulars.

mental A glycyphyllos is the largest of the European species. The leaves are sweet, with a mixture of bitterness, and do not seem to be agreeable to cattle, at least the plant, in its wild state, is left untouched; otherwise it might have been desirable to cultivate it

A Tragacantha was formerly considered as the plant yielding the gum Tragacanth of commerce, but Olivier (*Voyage dans l'Empire Ottoman*, v 342 pl 44.) discovered that it was generally procured from A. verus It is probable that both species, and perhaps some others, yield this gum. A. verus is a native of the north

History, Use, Propagation, Culture,

of Persia, flowering in July and August It rises two or three feet only in height, on a stem about an inch in thickness, with many branches closely crowded together, and covered with imbricated scales and spines, formed from the petioles of the former year The leaves, which scarcely exceed half an inch in length, are composed of *six*, seven, or eight pairs of opposite, villous, stiff, pointed leaflets, and the mid-rib is terminated with a sharp yellowish point The flowers are small, yellow, and proceed from the axillæ of the leaves with cottony bractes The calyx is five-toothed, and shorter than the corolla, which is papilionaceous The gum exudes in summer, more or less copiously according to the heat of the weather, in tortuous filaments, which are allowed to dry on the plant before being collected A large portion of the Tragacanth collected in Persia, is sent to India, Bagdad, Bassorah, and Russia But what we receive is sent to Aleppo, whence it is exported, packed in cases

Good gum Tragacanth is inodorous, impressing a very slightly bitter taste as it dissolves in the mouth Its mucilage differs from that of acacia gum, in being precipitated by the superacetate of lead, and oxymuriate of tin; and not by silicated potass (*Bostock. Nich Journ.* lviii. 30.), or the oxysulphate of iron. Medically it is de-

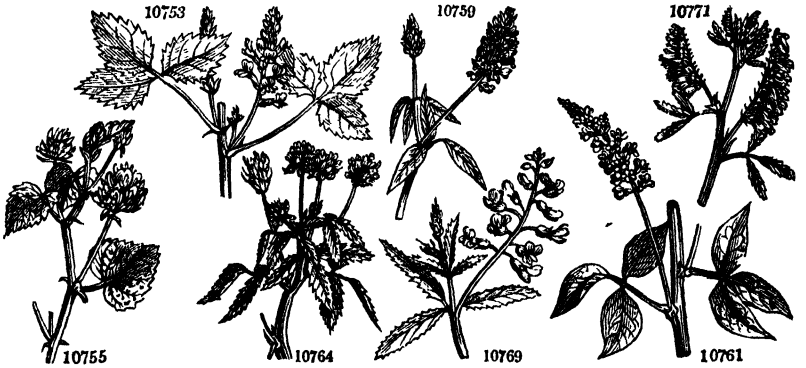
10729 Spikes obl term sol Lvs. about 3 pair obl and obovate obtuse
10730 Spikes long panicled, Lvs about 4 pairs linear
10731 Decandrous, Spikes capitate stalked axillary, Leaves in 4 pairs obl blunt
10732 Decandrous, Spikes capitate stalked term Lvs in 10 pairs obovate
10733 Decandrous, Spikes cylindr terminal, Lvs of 15 pairs lanc blunt
10734 Decandrous, Spikes cylindr terminal, Lvs of 10 pairs obcordate
10735 Decandrous, Spikes term long, Lvs of 5 pairs obovate

10736 Lvs pinn of 2 pairs lin. Pedunc. axill 1-fl
10737 Lvs pinn of 7 pairs lin-lanc Pedunc 1-fl axillary
10738 Lvs pinn and tern lanc Pedunc axill 1-3-flowered, Branches warted
10739 Lvs. tern cuneiform recurve mucronate, Flowers axillary solitary approximated
10740 Lvs tern obovate recurve mucro with pellucid spots, Spike term capitate, Bractes ciliated
10741 Lvs tern obovate recurve mucronate dotted beneath, Spike terminal oblong
10742 Lvs. of the stem and branches ternate and simple, of the branchlets none, Stipules imbricated
10743 Upper lvs simple, rest ternate, Leafl lin lanc mucronate, Pedunc axill clustered capitate
10744 Upper lvs simple, rest ternate, Leafl lin lanc mucro Pedunc axill solitary
10745 Leaves tern. lanc cuneate with a recurved mucro Pedunc axill aggregate
10746 Leaves tern. obovate with a recurved mucro, Pedunc axill solitary
10747 Leaves tern stalked obl mucro. Spikes terminal interrupted, Calyxes villous
10748 Leaves tern obovate emarg. Stem creeping, Flowers in umbels
10749 Leaves tern Leafl. ov-lanc. Petioles downy smooth, Spikes capitate stalked axillary
10750 Leaves tern Leafl ov-lanc acum Petioles rough, Racemes axillary
10751 Leaves ternate silky beneath, Pedunc axillary about twice as long as leaves, Heads depressed involucred
10752 Leaves tern ovate, Petioles downy sulcate, Spikes capitate stalked axillary

una Miscellaneous Particulars.



mulcent, and may answer the purposes of the acacia gum, being even better adapted for allaying tickling cough, and sheathing the fauces in catarrhal affections, owing to its great viscidity It is chiefly, however, employed for pharmaceutical purposes (*Thomson's London Dispensatory*, 187.) The seeds of A boeticus are roasted, ground, and used as a substitue for coffee in Hungary

1595 *Biserrula.* From *bis*, twice, and *serrula*, a little saw. The pods are toothletted on each edge. Pelecinon was the name given by the Greeks to the plant called by the Latins *Securidaca*

1596. *Dalea* Named after Thomas Dale, an English botanist, who lived in the beginning of the last century. There was another Dale, an author of a Pharmacologia. These are pretty little plants, with the aspect of Psoralea

1597. *Psoralea.* From ψωραλεος, warted, on account of the numerous little tubercles with which most of the species are covered. The species are chiefly low shrubs; some of them are ornamental, and all are of easy culture and propagation by young cuttings in sand or seeds, which they produce in abundance. P esculenta, the bread-root of America, is cultivated in Missouri, and other parts of that country. In this climate it will

History, Use, Propagation, Culture,

grow in the open air, but requires the protection of a frame to produce abundant crops of roots, which are used like those of the potatoe in the countries where it is a native (*Pursh. Amer.* t. 22.)

1598 *Melilotus* From *Mel*, honey, and *Lotus*. These plants are similar to the Lotus, and are the favorite resort of bees. M officinalis is the chief ingredient in flavoring the Gruyère cheese. This cheese no doubt owes its chief excellence to the mixture of herbs in the mountain pasturage which surrounds the valley of Gruyère, but partly also to the flowers and seeds of this plant, which are bruised and mixed with the curd before it is pressed.

1599 *Lupinaster*. That is to say, *Lupine-like*. A pretty little herbaceous plant, with bright flowers.

1600. *Trifolium*. A plant with three leaves, the τριφυλλον, of the Greeks, *trêfle*, of the French, and *trefoil*, of the English This genus includes the two most valuable herbage plants adopted in European agriculture, the white and red clover Notwithstanding all that has been said of the superiority of lucern to clover, and of the excellence of saint-foin, and various Leguminosæ of the pea kind, yet the red clover for mowing, and the white species for pasturage, are, and probably ever will be, found to excel all other plants in these respects. The yellow clover, T procumbens, and the cow or meadow clover, T. medium, are also in cultivation, but are far inferior to the others The meadow clover is a useful addition to the white sort in laying down permanent pastures; the yellow grows on poor soils, but the herbage is not much liked by cattle. The soil best adapted for clover is a deep sandy loam, which is favorable to its long tap-roots. but it will grow in any soil, provided it be dry So congenial is calcareous matter to clovers, that the mere strewing of lime on

10772 Pods racemose naked 1-seeded rugose obovate acute Stipules setaceous
10773 Pods racemose naked 2-seeded smoothish ovate acute compressed, Stipules toothed
10774 Pods racemose naked 1-seeded rugose obovate, Stipules setaceous
10775 Pods racemose naked 2-seeded rugose blunt, Leaflets entire
10776 Pods racemose naked 2-seeded membranous oval, Stem nearly erect
10777 Pods naked 8-seeded about 3 times as long as calyx, Stems declinate
10778 Pods 1-seeded obovate blunt naked rugose, Racemes longer than leaf, Stems diffuse

10779 Pods racemose naked compressed 1-seeded nerved hooked, Stipules subulate

10780 Heads halved, Leaves quinate sessile

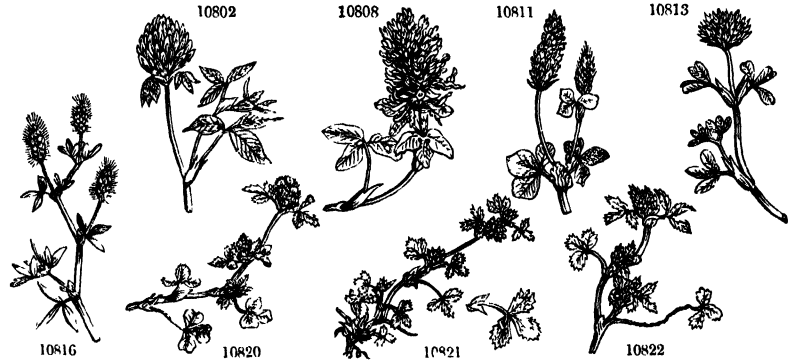
10781 Heads in fruit reflexed, Pods 3-seeded
10782 Heads umbelled in fruit reflexed, Pods 4-seeded, Stem angular with furrows flexuose
10783 Heads globose, Pods 2-seeded, Cal the length of corolla, Leafl serrulate, Stipules rhomboid
10784 Heads umbelled, Pods 4-seeded, Teeth of cal nearly equal, Leafl ovate-obl emarg serrulate
10785 Heads umbelled stalked, Teeth of cal subulate equal, Leafl obcord serrate
10786 Heads umbelled, Pods 4-seeded, Teeth of calyx equal, Leafl obovate blunt serrated
10787 Heads umbelled, Pods 4-seeded, Teeth of calyx nearly equal, Leafl ovate obl emarg serrulate
10788 Heads in globose umbels imbricated, Standards deflexed persistent, Pods 4-seeded
10789 Heads umbelled, Scape naked, Pods 2 seeded pendulous, Leaves linear lanc
10790 Heads umbelled, Pods 2-seeded, Teeth of cal unequal, Leafl obovate blunt toothed
10791 Heads villous 5-flowered, Central tuft reflexed rigid wrapping up the fruit
10792 Heads villous globose, Upper calyxes without florets
10793 Heads villous globose terminal solitary, Teeth of calyx setaceous longer than corolla
10794 Heads villous globose terminal solitary, Teeth of calyx setaceous shorter than corolla
10795 Heads subglobose hispid, Teeth of calyx subulate as long as cor Leafl obovate retuse
10796 Spikes roundish ovate villous, Teeth of calyx unequal setaceous as long as corolla

and Miscellaneous Particulars.

some soils will call into action clover-seeds, which it would appear have lain dormant for ages At least this appears the most obvious way of accounting for the well-known appearance of white clover in such cases

The climate most suitable for the clovers, as of most plants natives of Europe, is one neither very hot nor very dry and cold Most leguminous plants delight both in a dry soil and climate, and warm temperature; and the clover will be found to produce most seed under such circumstances, but as the production of seed is only in some situations an object of the farmer's attention, a season rather moist, provided it be warm, is always attended by the most bulky crops of clover herbage.

The time of sowing seeds is generally the spring, during the corn-seed time, or from February to May, but they may also be sown from August to October; and when they are sown by themselves, that is, unaccompanied by any corn crop, this will be found the best season, as the young plants are less liable to be dried up and impeded in their progress by the sun, than when sown alone in spring, and remaining tender and unshaded during the hot and dry weather of July



The manner of sowing is almost always broad-cast. When sown with spring corn, clover and grass-seeds are usually put in immediately after the land has been pulverized by harrowing in the corn seed, and are themselves covered by one course more of the harrows; or, if the corn is drilled, the small seeds are sown immediately before or after hand-hoeing, and the land is then finished by a course of the harrows

In the operation of sowing, some consider it best to sow the clover and rye-grass separately, alleging that that the weight of the one seed and lightness of the other, are unfavorable to an equal distribution of both

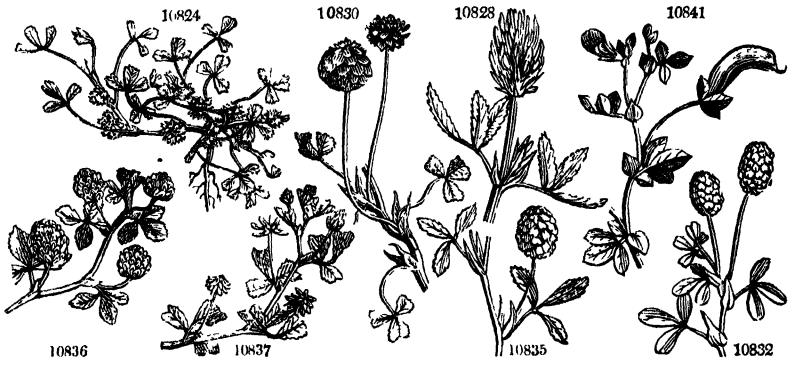
History, Use, Propagation, Culture,



The quantity of seed varies from eight to fourteen pounds per acre, according to the intention of the crop, the quantity of grass-seeds sown, &c The after culture of clover and rye-grass consists chiefly of picking off any stones or rather hard bodies which may appear on the surface in the spring succeeding that in which it was sown, and cutting out by the roots any thistles, docks, or other large grown weeds After this, the surface should be rolled once to smooth it for the scythe This operation is best performed in the first dry weather of March Some give a top-dressing of soot, gypsum, common lime, peat, or wood-ashes, at this time or earlier, gypsum has been particularly recommended as a top-dressing for clovers and the other herbage legumes, because as their ashes afford that substance in considerable quantities, it appears to be a necessary ingredient of their food

The taking of the clover, or clover and rye grass crop, is either by cutting green for soiling, by making into hay, or by pasturing It is observed in *The Code of Agriculture*, that it is a most important point to ascertain, in what cases cutting or feeding is most beneficial If fed, the land has the advantage of the dung and urine of the pasturing stock, but the dung being dropt in irregular quantities, and in the heat of summer, when it is devoured by insects, loses much of its utility If the dung arising from the herbage, whether consumed in soiling, or as hay, were applied to the land in one body and at the proper season, the operation would be more effectual The smother of a thick crop, continued for any time upon the ground, greatly tends to promote its fertility, and it has been pretty uniformly found, after repeated trials, upon soils of almost every description, that oats taken after clover that has been cut, either for soiling or hay, is superior to the crop taken after clover pastured by sheep

The produce of clover-hay, without any mixture of rye-grass, on the best soils, is from two to three tons per acre, and in this state in the London market it generally sells twenty per cent. higher than meadow-hay, or

and Miscellaneous Particulars

clover and rye-grass mixed The weight of hay from clover and rye-grass varies according to the soil and the season, from one to three tons per English acre, as it is taken from the tramp-ricks, but after being stacked, and kept till spring, the weight is found to be diminished twenty-five or thirty per cent.

The value of clover and rye-grass hay, in comparison with the straw of beans or pease, may be in the proportion of three to two, and with the finest straw of corn crops, in the proportion of two to one One acre of red or broad clover will go as far in feeding horses or black cattle, as three or four of natural grass And when it is cut occasionally, and given to them fresh, it will probably go still much farther, as no part of it is lost by being trod down

The saving of clover seed is attended by considerable labor and difficulty Clover will not perfect its seeds, if saved for that purpose early in the year, therefore it is necessary to take off the first growth either by feeding or with the scythe, and to depend for the seed on those heads that are produced in the autumn.

The produce in seed may generally be from three to four or five bushels per acre, when perfectly clean, weighing from two to three hundred weight But there is great uncertainty in the produce of clover-seed, from the lateness of the season at which it becomes ripe, and the fertility of the soil is considerably impaired by such a crop Yet the high value of the seed is a great inducement to the saving of it, in favorable situations

T. incarnatum is sometimes sown as a border flower

1601 *Lotus* Λωτος, in Greek There were three sorts of Lotus distinguished by the ancients, viz *their tree* lotus, which was our Zizyphus lotus, the *marsh* lotus, which was our Nymphæa lotus, and the *herbaceous* lotus, which appears to have been the present genus

The pods of L. edulis are still eaten in Candia, by the poorer inhabitants. Lotus rectus has by some been

History, Use, Propagation, Culture,

supposed the Cytisus of Virgil, but, as other contend, without sufficient foundation Lotus jacobæus is a valuable greenhouse plant, as flowering all the year L major and corniculatus are very suitable to sow with white clover and cow-grass, in laying down lands to permanent pasture Dr Henderson has written a good deal in their favor, Miller is against them, but Sinclair, in his work on the British Grasses, found it a valuable ingredient in meadows, especially where the soil was rather moist (*See Ency of Agr.* p 111 b 6.) *Gebelia* is the Arabic name (*Gébélié*) of the species to which it has been applied.

1602. *Tetragonolobus.* From τετρας, four, γωνια, an angle, and λοβος, a bean, in allusion to the four wings of the pods. Tetragonolobus edulis is now a popular border annual, on account of its curious pods, but it was formerly an esculent legume, these pods being used like those of the kidney bean, by the poor of Sicily and Spain.

1603. *Trigonella* From τρις, three, and γωνια, an angle The standard of the flower is flat, and the keel very small and narrow, which gives the flower a triangular appearance. T fœnum-græcum, a plant cultivated by the Romans, is still occasionally employed in the agriculture of the south of Europe The seeds have a strong

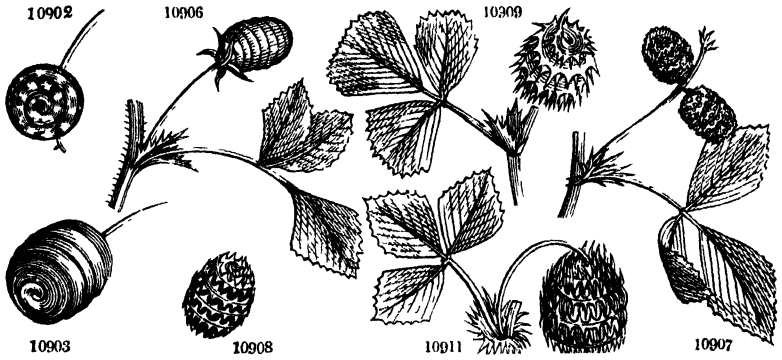
History, Use, Propagation, Culture,



1605. *Medicago* A native of the country of the *Medes*, whence this plant was brought to Greece during the expedition of Darius M arborea, the Cytisus of the ancients, flowers great part of the year, and when sheltered is seldom destitute of flowers In the open air it begins to flower in April, and continues till December Those flowers which appear early in summer, will have the seeds ripe in August, or the beginning of September, and the others will ripen in succession It grows in great plenty in Abruzzo, and many parts of the kingdom of Naples, where the goats feed upon it, and with the r milk abundance of cheese is made there It also abounds in several of the islands in the Archipelago, where the Turks use the wood to make handles for their sabres, and the caloyers, or Greek monks, form their beads of it In old shrubs, the heart is of a dark color, and hard like ebony

According to Miller, this shrub bids the fairest of any to be the Cytisus of Virgil, Columella, and the other ancient writers on husbandry, and being celebrated by them as an excellent fodder, has been recommended for cultivation here But however useful it may be in Candia, Rhodes, Sicily, Abruzzo, and other dry warm countries, yet it will never thrive in England, (where we have also many plants of this leguminous tribe far more succulent than this,) so as to be of any real advantage, for in severe frost it is very subject to be destroyed, or at least so much damaged, as not to recover its former verdure before the middle or end of May, (and even after a mild winter, it will generally appear injured by our cold spring winds, even at that season, so that it cannot be of any use here for early spring fodder) Besides, the shoots will not bear cutting above once in a summer, and then will not be of any considerable length and the stems growing very woody, the cutting of it will be very troublesome. Upon the whole, therefore, it is not worth the trial, though in hot, dry, rocky countries, where few other plants will thrive, it may be cultivated to great advantage But, however unfit Tree Medick may be for use as fodder in England, yet for the beauty of its hoary leaves, abiding all the year, together with its long continuance in flower, it deserves a place in every good garden and plantation, with shrubs of the same growth (*Dict in loco, and Martyn's Virgil*)

M sativa, *Foin de Bourgogne*, Fr, *Alfalfa*, Span, and *Lucerne*, Eng, (from the Languedoc pâtois *Lauserda*), is a deep rooting perennial plant, sending up numerous small and tall clover-like shoots, with blue or violet spikes of flowers It is highly extolled by the Roman writers, it is also of unknown antiquity in old Spain, Italy, and the south of France, is much grown in Persia and Peru, and mown in both countries all the year round. It is mentioned by Hartlib, Blythe, and other early writers, and was tried by Lisle, but it excited little attention till after the publication of Harte's Essays, in 1757. But though it has been so much extolled, it has yet found no great reception in this country If any good reason can be given for this, it is, that lucern is a less hardy plant than red clover, requires three or four years before it comes to its full growth, and is for these and other reasons ill adapted to enter into general rotations When the climate and soil suit, perhaps, a field of it may be advantageously sown, adjoining the homestall, to afford early cutting or food for young or sick animals, for which it is said to be well adapted, but though it will produce good crops for eight or ten years, yet from the time the farmer must wait till this crop attains its perfection, and from the care requisite to keep it from grass and weeds, we do not think it is ever likely to come into general culture.

There are no varieties of the lucern deserving the notice of a cultivator. What is called the yellow lucern, or Swiss lucern, is the Medicago falcata, a much more hardy and coarser plant, common in several parts of England, but not cultivated any where excepting in some poor soils in Switzerland.

10890 Pods lunate entire at edge, Stem arborescent
10891 Pedunc. many-fl. racemose, Pods reniform 1-seeded, Leafl rhombold roundish mucronate
10892 Pedunc. racemed, Legume smooth spirally twisted, Stipules entire, Leafl. long toothed

10915 Pedunc. many-fl Pods cochleate cylindr flat at each end pubescent with close-pressed subul prickles
10916 Pedunc many-fl Pods cochleate flat at each end with 3 netted folds muricate at edge
10917 Pedunc. about 2-fl Pods cochleate cylindr flat at each end with smooth lanc distich close-pressed prickles

and Miscellaneous Particulars

The soil for lucern must be dry, friable, inclining to sand, and with a subsoil not inferior to the surface, unless the soil be good and deep, it is in vain to attempt to cultivate lucern

The preparation of the soil consists in deep ploughing and minute pulverisation, and, in our opinion, the shortest way to effect this, is to trench it over by the spade to two or three feet in depth, burying a good coat of manure in the middle, or at least one foot from the surface This is the practice in Guernsey, where lucern is highly prized.

The climate for lucern, as we have already hinted, must be warm and dry, it has been grown in Scotland and Ireland, and might probably do well in the southern counties of the latter country, but in the former it has not been found to answer the commendations of its admirers

The season most proper for sowing lucern, is as early as can be done in the spring months, as in this way the plants may be fully established before the season becomes too hot If the plants be intended to be transplanted out in the garden method, it will also be the best practice to sow the seed-bed as early in the spring as the frosts will admit, in order that they may be strong, and fit to set out about the beginning of August

The manner of sowing lucern is either broad-cast or in drills, and either with or without an accompanying crop of corn for the first year Broad-cast, and a very thin crop of barley or other spring corn, is generally, and, in our opinion, very properly preferred

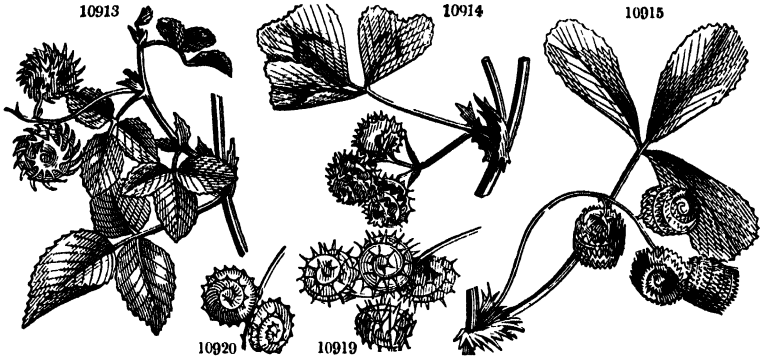
The quantity of seed, when the broad-cast method is adopted, is said to be from fifteen to twenty pounds per acre, and from eight to twelve if drilled The seed is paler, larger, and dearer than that of clover, it is generally imported from Holland, and great care should be had to procure it plump and perfectly new, as two years old seed does not come up freely The same depth of covering as for clover will answer

The after-culture of lucern, sown broad-cast, consists in harrowing, to destroy grass and other weeds, rolling, after the harrowing, to smooth the soil for the scythe, and such occasional top-dressings of manure as the state of the plants may seem to require

The top-dressings given to lucern may be either of the saline or mixed manures. Ashes are greatly esteemed, and also gypsum and liquid manure of any kind

The taking of lucern by mowing for soiling, or hay, or by tethering, hurdling, or pasturing, may be considered as the same as for clover Lucern frequently attains a sufficient growth for the scythe towards the end of April, or beginning of the following month, and in soils that are favorable for its culture, will be in a state of readiness for a second cutting in the course of a month or six weeks longer, being capable of undergoing the same operation at nearly similar distances of time during the whole of the summer season

The application of lucern is also the same as of clover. The principal and most advantageous practice, in the application of lucern, is that of soiling horses, neat cattle and hogs, but as a dry fodder, it is also capable of affording much assistance, and as an early food for ewes and lambs, may be of great value in particular cases All agree in extolling it as food for cows, whether in a green or dried state.



The produce of lucern, cut three times in a season, has been stated at from three to five and even eight tons per acre In soiling, one acre is sufficient for three or four cows during the soiling season, and a quarter of an acre, if the soil be good, for all sorts of large stock, for the same period, or half an acre on a moderate soil.

The nutritive product of lucern, according to Sir H Davy, is 2-3-tenths per cent., and is to that of the

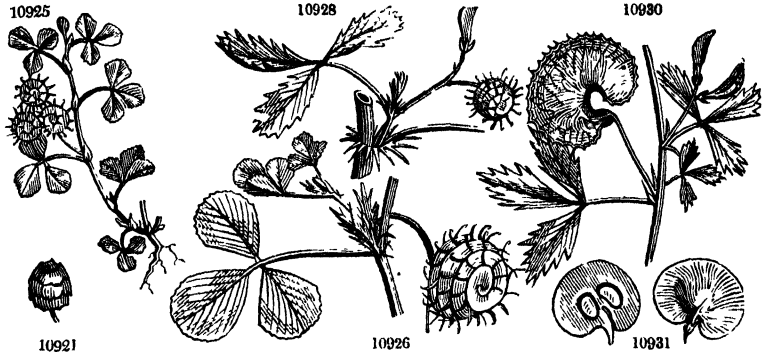
History, Use, Propagation, Culture,



clovers and saintfoin as 23 to 39 This result does not very well agree with the superior nutritive powers attributed to lucern, and is one proof, among many, how little the analysis of the chemist agrees with the experience of the farmer

To save seed, the lucern may be treated precisely as the red clover, and it is much easier threshed, the grains being contained in small pods, which easily separate under the flail, or a threshing machine, or clover mill

M. lupulina, Hop-trefoil, sometimes called Shamrock, and in Norfolk Black Nonesuch, is cultivated occa-

10918 Pedunc. many-fl. Pods cochleate flat at each end, Folds 2 reticulated with prickles of their edges diverging
10919 Pedunc. many-fl Pods cochleate flat at each end smooth, Folds 5 with short subulate prickles
10920 Pedunc. about 2-fl. Pods cochleate flat at each end villous, Folds 5 with subulate hooked prickles
10921 Pedunc many-fl. Pods cochleate roundish muricate, Leafl. downy obovate entire
10922 Pedunc many-fl. Pods cochleate cylindr. flat at each end, Folds 5 with short subulate reflexed prickles
10923 Pedunc 2-fl. Pods cochleate cylindr. flat at each end with conical distichous reflexed prickles
10924 Pedunc. many-fl. Pods cochleate cylindr. Prickles conical straight spreading
10925 Pedunc many-fl. Pods cochleate hairy, Prickles subulate straight hooked
10926 Pedunc. 2-fl Pods cochleate cylindr with close folds, Prickles subulate straight hooked
10927 Pedunc. many-fl Pods cochleate somewhat hairy, Prickles subulate straight hooked
10928 Pedunc. 2-fl Pods cochleate cylindr. with subulate straight hooked prickles, Leafl. lin. truncate
10929 Pedunc. many-fl Pods cochleate villous flat at each end with 5 folds, Prickles subulate straight hooked

and Miscellaneous Particulars

sionally along with the perennial clovers, and sometimes confounded with the common yellow clover, which is an annual and much smaller plant. Its treatment is the same as that of white clover, but its herbage is little relished by cattle, and both it and the yellow clover are going fast out of repute

M scutellata and intertexta are sown as border flowers for the curiosity of their pods

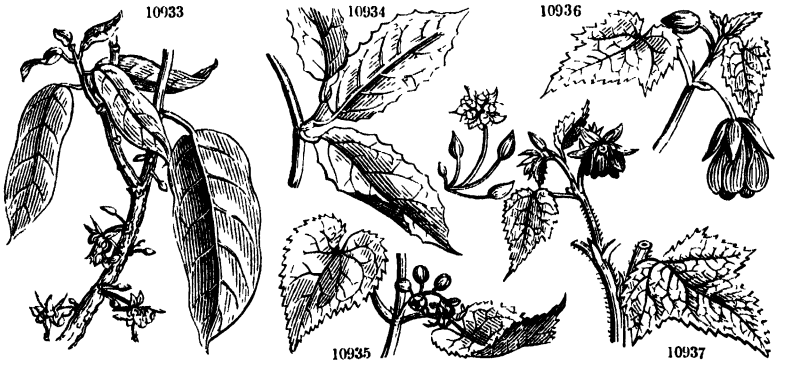
1606 *Hymenocarpus* From ὑμην, a membrane, and καρπος, fruit, in allusion to the membranous texture of the pods Little inconspicuous plants resembling Trifolium

Class XVIII. — POLYADELPHIA. Stamens united into several parcels.

One of the smallest of the Linnean classes, characterized by the cohesion of the filaments in several parcels It almost wholly consists of plants remarkable either for their beauty or importance otherwise From the Theobroma the nutritious substance which forms the basis of Chocolate is procured Melaleuca and its allies are among the most elegant of New Holland plants The genus Symplocos contains a plant useful as a dye To Citrus belong the Orange, Lemon, Lime, and all their delicious varieties; and the Loasa, with which the class is here concluded, consists of some of the most ornamental and curious of our garden annuals

By some botanists this class is distributed among others, especially Icosandria and Polyandria

Order 1 DECANDRIA  Stamens 10 or 12.



1607 *Theobroma* Cal 5-leaved Petals 5, fornicate Nectary urceolate, with 5 horns Filaments 5, each with 2 anthers Style filiform Stigma 5-parted Caps 5-celled, without valves Seeds in a buttery pulp

1608 *Bubroma* Cal 3-leaved Petals 5, 2-horned Nect campanulate, 5-fid. Filam 5, attached to the outside of nectary, each with 3 anthers Style simple Capsule woody, warted, valveless, bored with 12 rows of holes

Hstory, Use, Propagation, Culture,

1607 *Theobroma* From Θεος, God, and βρωμα, food, in allusion to the excellent nature of its produce The Mexicans call the beverage obtained from it (*hocolatl* (*Nueremb*) T Cacao is a tree which grows in a very handsome form to the height of twelve or sixteen feet, the trunk is upright, and about as high as a man before the head spreads out, the wood is light and of a white color, the bark brownish Leaves lanceolate-oblong, bright green, quite entire, flowers small, reddish, inodorous Fruits smooth, yellow, red, or of both colors, about three inches in diameter rind fleshy, near half an inch in thickness, flesh-colored within · pulp whitish, the consistence of butter, separating from the rind in a state of ripeness, and adhering to it only by filaments, which penetrate it and reach to the seeds Hence it is known when the seeds are ripe, by the rattling of the capsule when it is shaken The pulp has a sweet and not unpleasant taste, with a slight acidity, it is sucked and eaten raw by the natives The seeds are about twenty five in number when fresh they are of a flesh-color gathered before they are ripe, they preserve them in sugar, and thus they are very grateful to the palate they quickly lose their power of vegetation, if taken out of the capsule, but kept in it, they preserve that power for a long time The tree bears leaves, flowers, and fruit all the year through, but the usual seasons for gathering the fruit are June and December In two years from the seed it is above three feet high, and spreads its branches, not more than five of which are suffered to remain: before its third year is complete it shows for fruit A tree yields from two to three pounds of seeds annually These seeds are remarkably nourishing, and agreeable to most people, which occasions them to be commonly kept in most houses in America, as a necessary part of the provisions of the family they are generally ground or pounded very fine, a little arnatto added, and made into paste · they are much charged with oil, but mix well with milk or water, and are formed into rolls of one pound each.

This simple preparation of chocolate is the most natural and the best It is in daily use amongst most

1609. *Abroma* Cal 5-part Petals 5, with saccate dilated claws Cup of stamens 10-fid, with 5 segments, each bearing 3 anthers, the other 5 petaloid. Styles 5 Caps. 5-celled, 5-winged, many-seeded.

Order 2. POLYANDRIA. Stamens indefinite.

1610 *Melaleuca.* Parcels of stamens 5, opposite the petals, long, anthers incumbent. Caps 3-celled, many-seeded, connate, and included in the thickened tube of the calyx which is grown to the branch

1611 *Tristania.* Parcels of stamens 5, opposite the petals, and scarcely longer than they are, anthers incumbent. Caps. 3-celled, many-seeded, united with the turbinate stalked tube of the calyx

1612. *Calothamnus* Parcels of stamens 4-5, opposite the petals (some either connate or sterile). Anthers inserted by the base, entire. Caps 3-celled, many-seeded, connate, and included in the thickened tube of the calyx, which is grown by the base to the branch

1613. *Beaufortia* Parcels of stamens 5, opposite the petals Anthers inserted by the base, bifid at the end, with deciduous lobes Caps 3-celled, 1-seeded, connate, and included in the thickened tube of the calyx, which is grown by the base to the branch

1614 *Symplocos* Cal 5-fid, superior Petals 5-8, cohering at the base in a tube. Stamens united to the corolla in 4 rows. Drupe dry, 5-celled.

1615 *Citrus* Cal 5-fid Petals 5, oblong Anthers 20, the filaments variously divided Berry 9-celled.

1616 *Xanthochymus.* Cal 5-leaved. Petals 5 Nectaries 5. Stamens united in 5 parcels Apple 1-5-seeded.

1617 *Hypericum* Cal 5-parted Petals 5. Filaments many in 3 or 5 parcels. Capsule superior.

1618 *Ascyrum* Cal 4-leaved Petals 4 Caps 1-celled, 2-3-valved

1619. *Louisa* Cal 5-leaved Petals 5 Nectary 5-leaved Caps ½-inferior, 1-celled, ½-3-valved, many-seeded

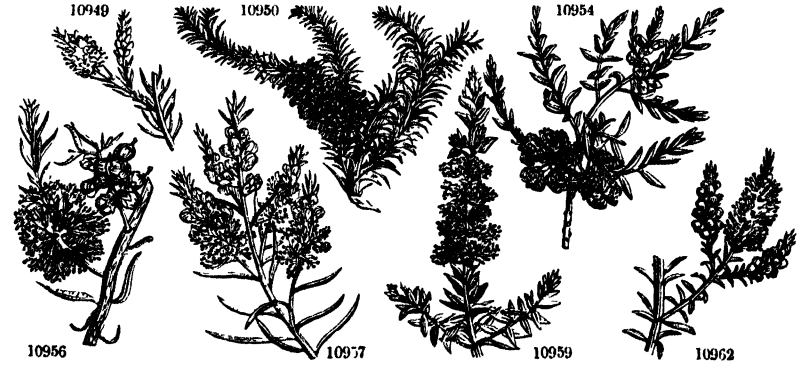
10935 Leaves cordate ovate acute with unequal serratures

10936 Leaves 7-angled floral ovate acuminate somewhat toothed, Pedunc axill Branches unarmed
10937 Adult lvs with simple and stellate hair beneath, Wings of caps subtruncate at end, Branches muricated

and Miscellaneous Particulars.

families in Jamaica, where the tree is largely cultivated, and affords a nutritious food for children, as well as adults. But as chocolate made abroad cannot by law be imported into this country, consequently all chocolate consumed in Britain ought to be made here It is composed principally of the kernel of the cocoa, as above mentioned, but the art is in very few hands and we believe that a small portion of soap is added to most British chocolate, in order to cause it to froth when it is dissolved in hot water

Cocoa is a simple preparation made in Britain, from the cocoa-nut, or from the shells of it, or from a mixture of both It is considered much easier of digestion than chocolate, and very nourishing.



In our stoves Theobromas thrive in light rich soil, and cuttings root in sand under a hand-glass

1608 *Bubroma* In contradistinction to Theobroma, from Θεος, an ox, and βρωμα, food, as if producing a substance fit only to be eaten by cattle. *Orme d'Amerique*, Fr A wide spreading tree, not unlike the Elm, with oblong heart-shaped leaves, which sleep hanging quite down, whilst the petioles remain entirely stiff and straight It grows in the lowlands of Jamaica, forming a very agreeable shade for the cattle, and supplying them with food in dry weather, when all the herbage is burned up or exhausted. The seeds are very mucilaginous, but otherwise agreeable to the palate The wood is light, and so easily wrought, that it is generally used by coachmakers in all the side pieces (*Browne*) It is also frequently cut into staves for casks A decoction of the inner bark is very glutinous, and very like that of the elm In our stoves it thrives well in a loamy soil, and cuttings root freely in sand under a hand-glass

1609. *Abroma* Still named with reference to the two preceding genera, from α, privative, and βρωμα, food, as if unfit for either gods or oxen This, Sweet observes, "is a hardy stove genus, and easily managed, the species flower freely at various seasons, and will grow in the common garden soil: but a mixture of good loam with a little peat is an excellent compost for them. They propagate freely by seeds and cuttings" (*Hot Cult.* 10)

History, Use, Propagation, Culture,

1610 *Melaleuca* From μελας, black, and λευκος, white: because the original tree has black wood and white branches A beautiful Australasian genus, which grows and flowers freely in equal parts of sandy loam and peat, with common greenhouse treatment "Some cultivators," Sweet observes, "grow them entirely in peat, in which they will grow very well for a time; but they will not be strong and healthy, nor flower so well as in a mixture Ripened cuttings, not too old, will root freely in sand under a bell-glass." (*Bot Cult* 223)

The bark of Melaleuca Leucadendron is used by the Chinese as oakum, for making good the spaces between the timbers of their vessels They also use it in the roofing their houses From the same tree is obtained the Cajeputi oil, remarkable for its green color, its peppermint flavor, and turpentine smell It is rarely to be procured in Europe in an unadulterated state When pure it is one of the best preservatives of preparations of natural history, and is used externally with much success as a cure for rheumatic affections and pains in the joints.

1611. *Tristania.* From τρεις, three, and στημι, to stand; in allusion to the ternate disposition of the flowers and leaves The species may be treated like Melaleuca, and are pretty little evergreen shrubs.

1612. *Calothamnus.* From καλος, beautiful, and θαμνος, a rod, in allusion to the splendid appearance of the branches covered with scarlet blossoms The species are beautiful plants, and not difficult of culture or propagation in sand, and the air kept still and moderately moist by covering with a hand-glass.

POLYANDRIA.

10938 Leaves alternate lanc acuminate oblique 5-nerved, Branches and petioles smooth

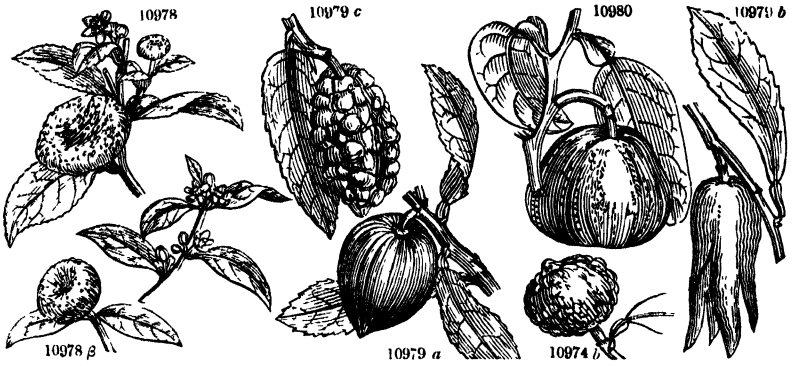
10974 Petioles naked, Lvs ov rounded serrated, Fl 30-androus, Fruit globose with a nipple and sweet pulp
10975 Petioles nearly naked, Lvs ov obl and acute, Fl 20-androus, Fruit globose with a thin skin and sweet pulp
10976 Peti winged, Lvs ellipt acute crenulat Fl 20-androus, Fruit glob with a thin rough skin and bitter pulp



and Miscellaneous Particulars.

1613 *Beaufortia.* So called in honor of Mary, Duchess of Beaufort, who died January 7, 1714, in the 85th year of her age She had a fine collection of plants at Badmington, in Gloucestershire, during the life-time of her husband, Henry, first duke of Beaufort Splendid plants, free-growers, and abundant flowerers, with common greenhouse treatment, in two-thirds peat, and one-third loam. Cuttings, Sweet found to answer best when "taken from nearly ripened wood, planted in sand, and covered with a bell-glass."

1614 *Symplocos.* From *συμπλοκη*, connection, union The petals are naturally five, but united at the base so as to seem but one A tree with oblong fragrant shining leaves, and sweet-smelling flowers, succeeded by subsessile drupes A decoction of the leaves is used in North America for dying linen and silk of a bright yellow color

1615 *Citrus.* The meaning of this word has escaped the ingenuity of etymologists. An ancient genus, combining in its species many excellencies, handsome evergreen shining tree-like forms, most odoriferous flowers, and brilliant, fragrant, delicious fruits It is one of the most striking of fruit-bearing trees, and must have attracted the notice of aboriginal man long before other fruits of less brilliancy, but of more nutriment or flavor The golden apples of the heathens, and forbidden fruit of the Jews, are supposed to allude to this family, though it is remarkable that we have no authentic records of any species of Citrus having been known, certainly none were cultivated by the Romans The citron was introduced into Europe from Media, under the name of *malus medica*, and was first cultivated in Italy by Palladius, in the second century The orange

History, Use, Propagation, Culture,

is supposed to have been introduced into Italy in the fourteenth century, above a thousand years after the citron In England, these trees have been cultivated since 1629 Parkinson, writing at that time, says, "the orange hath abiden with some extraordinary looking and tending, when neither citron nor lemon trees could be preserved any length of time" The orange trees he alludes to were those of Beddington, in Surrey, introduced from Italy by a knight of the noble family of the Carews (*Gibson's* edit of *Camb Brit*), and the first that were brought into England, they were planted in the open ground and placed under a moveable cover during the winter months It has been said that these trees were raised by Sir Francis Carew, from seeds brought to England by Sir Walter Raleigh but as such trees would not have readily borne fruit, Professor Martyn thinks it much more likely that they were plants brought from Italy Bradley says, they always bore fruit in great plenty and perfection, that they grew on the outside of a wall, not nailed against it, but at full liberty to spread; they were fourteen feet high, the girt of the stem twenty-nine inches, and the spreading of the branches one way nine feet, and twelve feet another These trees, Evelyn informs us, were neglected in his time, during the minority of their owner, and finally entirely killed by the great frost in 1739-40, they were planted before 1595

During the latter end of the seventeenth and beginning of the eighteenth centuries, the orange tree was a very fashionable article of growth in conservatories, when there were but few exotics of other sorts kept there The plants were procured from Genoa, with stems generally from four to six feet in height, they were planted in large boxes, and were set out during summer to decorate the walks near the house, in the manner still practised at Versailles and the Thuilleries About the middle of the eighteenth century, when a taste for botany and forcing exotic fruits became general, that for superb orange trees began to decline, many of these large trees have decayed through neglect, and those which are now to be found in the greater number of greenhouses, are generally dwarf plants bearing few fruit, and those of small size In some places, however, are still to be found large and flourishing trees Those at Singorony, in Glamorganshire, are the largest in Britain, they are planted in the floor of an immense conservatory, and bear abundantly It is said that the plants were procured from a wreck on the coast in that quarter, in the time of Henry VII.

At Nuneham, near Oxford, are some fine old trees, planted under a moveable case, sheltered by a north wall In summer the case is removed, and the ground turfed over, so that the whole resembles a native orange grove At Wormleybury, Hertfordshire, and Shipley Hall, in Derbyshire, are very fine large orange and lemon trees grown in borders and in boxes (*Hort Trans* vol ii 295, and iv 306)

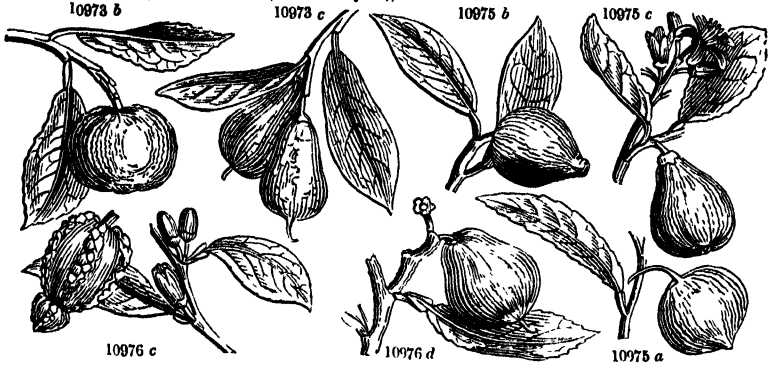
At the Wilderness, Kent, are three trees in boxes, not surpassed by any trees so grown in Europe

At Woodhall, near Hamilton, trees of all the species of Citrus are trained against the back walls of forcing houses, in the manner of peaches, and produce large crops of fruit

In the south of Devonshire, and particularly at Saltcombe, one of the warmest spots in England, may be seen, in a few gardens, orange trees that have withstood the winter in the open air upwards of a hundred years The fruit is as large and fine as any from Portugal Trees raised from seed, and inoculated on the spot, are found to bear the cold better than trees imported

The common character of the Citrus family is that of low evergreen trees, with ovate or oval-lanceolate, entire or serrated leaves On the ungrafted trees are often axillary spines The flowers appear in peduncles, axillary or terminating, and one or many-flowered The fruits are large berries, round or oblong, and generally of a yellow color The species seem best distinguished by the petiole, which in the orange and shaddock is winged, in the citron, lemon, and lime, naked The form of the fruit, although not quite constant, may also serve for a distinction In the orange and shaddock it is spherical, or rather an oblate spheroid, with a red or orange-colored rind, in the lime, spherical, with a pale rind, in the lemon, oblong, rough, with a nipple-like protuberance at the end, in the citron, oblong, with a very thick rind The flowers of the citron and lemon have ten stamens, and those of the orange more It is very difficult to determine what is a variety, and what is a species in this genus, many of the sorts in cultivation are by buds

Dr Sickler, who spent several years in Italy, and paid great attention to the kinds and culture of the orange, published in 1815, Der Vollkommen Orangerie-Gartner (The complete Orange Gardener), in which he describes above seventy sorts of Citrus



Gallesio (*Traité du Genre Citrus*, &c Savonna, 1818.) has given a synopsis of the forty principal sorts cultivated in Italy

The most splendid work on oranges which has yet appeared is the Histoire Naturelle des Orangers, by Risso, of Nice, and Poiteau, of Versailles (Paris, fol 1818) Here 169 sorts are described, and 105 of them figured, and their French and Italian culture given at great length They are arranged as sweet oranges, of which they describe 42 sorts, bitter and sour oranges, 32 sorts, bergamots, 5 sorts, limes, 8 sorts, shaddocks, 6 sorts, lumes, 12 sorts, lemons, 46 sorts, citrons, 17 sorts.

All the species of Citrus endure the open air at Nice, Genoa, and Naples, but at Florence and Milan, and often at Rome, they require protection during the winter, and are generally placed in conservatories and sheds The largest conservatory in Italy is that of Prince Antonio Borghese, at Rome, which contains seventy select sorts of *agrumi* The largest trees are at Sorenta, Terracina, Gaeta, and Naples, but the most regular and garden-like culture of the orange, is in the orange orchards at Nervi, Monaco, and other places in the neighbourhood of Genoa. At Nervi are also the orange nurseries which may be said to supply all Europe with trees, they are, in general, wretchedly cultivated, and the stocks inoculated in the most unscientific manner, but the fine climate, strong clayey soil, and abundant manuring, supply in a great degree the nicer practices

10977 Petioles lin. very short, Lvs. ovate retuse, Flowers racemose
10978 Petioles sublinear straight, Branches ascending unarmed, Fruit depressed, Skin separated from flesh

10979 Petioles naked, Lvs obl acute, Fl. 40-androus, Fruit obl rugose with acid pulp
10980 Petioles winged, Lvs blunt emarg Fruit very large with a thick skin

and Miscellaneous Particulars

of gardening There the names of varieties vary as much as those of gooseberries do in England, but from upwards of 180 names, not above 40 distinct sorts can be procured Good plants of the Maltese and other varieties of orange may be procured from Malta, and some sorts also from Lisbon From the nurseries at Paris about thirty sorts may be obtained, much smaller plants than those from the other places named, but more scientifically grafted or inoculated The catalogues of London nurserymen enumerate above thirty varieties of oranges, twelve of lemons, and several varieties of the other species, the plants are partly Genoese, partly French, and partly propagated here

The C aurantium, the common orange, *orange*, Fr, *pomeranze*, Ger, and *arancio*, Ital, is a middle sized evergreen tree, with a greenish-brown bark, and, in its wild state, with prickly branches The fruit is nearly round, from two to three inches in diameter, and of a gold color It is now cultivated in most countries of Europe, in the open air in Italy and Spain, and in conservatories or greenhouses in Britain and the north of Europe

The two principal varieties are the sweet or China orange, the *orange douce* of the French, and *porto-gallo* or *poma de sino* of the Italians, and the bitter or Seville, the *bigarade* of the French, and *arancio volgaro* of the Italians The Maltese orange, distinguished by its red pulp, is also a noted and much-esteemed sort The box-leaved, willow-leaved, and some others, are cultivated more as curious varieties than for their fruit

C Medica, the citron, *citron*, Fr, *citronier*, Ger, and *cedrate*, Ital, in its wild state grows to the height of about eight feet, erect and prickly, with long reclining branches The leaves are ovate, oblong, alternate, subserrate, smooth, pale green The fruit or berry is half a foot in length, ovate, with a protuberance at the lip. There are two rinds, the outer thin, with innumerable miliary glands, full of a most fragrant oil, the inner thick, white, and fungous

In China they have a variety of the C Medica, of very considerable size, quite solid, with scarcely any pulp or cells, and divided at the end into five or more long round lobes, on which account it is called *Phat thu*, or finger-orange The fruit is laid upon fine porcelain vessels in the sitting-rooms of the Chinese, for the sake of its agreeable perfume

Dr Sickler enumerates only about a dozen citrons and citronates as grown in Italy The French nurseries have nearly twenty names in their lists In England six are cultivated for sale

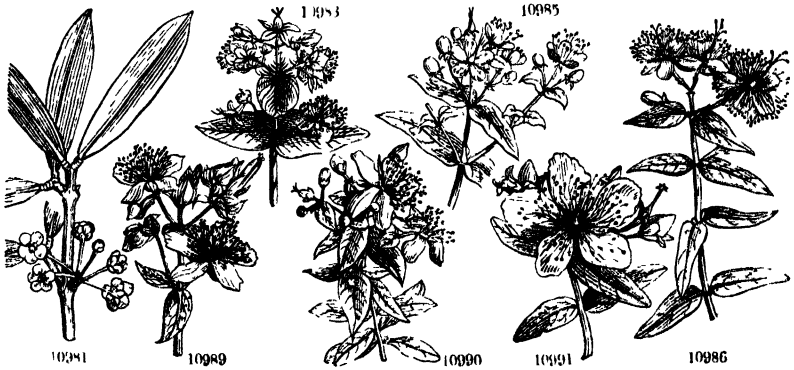
C Limonum, the lemon, *limon*, Fr, *limonier*, Ger, and *limone*, Ital, has the fruit less knobbed at the extremities, is rather longer and more irregular, and the skin is thinner than in the citron, the wood is more knotty, and the bark rougher

Dr Sickler enumerates twenty-eight varieties as grown in Italy The French, according to Ville Hervé have eleven sorts, in the London nurseries are cultivated twelve

C Limetta, the lime, by some esteemed a variety of the C Medica, *lime*, Fr, Ital, and Ger, grows to the height of about eight feet, with a crooked trunk, and many diffused branches, with prickles The leaves are ovate lanceolate, almost quite entire Berry an inch and a half in diameter, almost globular, with a protuberance at the top, the surface regular, shining, greenish-yellow, with a very odorous rind, enclosing a very acid juice

The French have two sorts of lime, and, according to Dr Sickler, the Italians have four varieties, five kinds are grown in the London nurseries

C decumana, the shaddock, *orange pampelmouse*, Fr, *arancio massimo*, Ital, is above the middle size, with spreading prickly branches The leaves are ovate, subacute, seldom obtuse, the petioles are cordate, winged, the wings as broad as the leaves The berry spheroidal, frequently retuse at each end, of an even surface, and greenish yellow color, pulp red or white, juice sweet or acid, rind white, thick, fungous, and bitter Thunberg says, the fruit in Japan grows to the size of a child's head, and Dr Sickler states its weight as fourteen pounds, and its diameter as from seven to eight inches. It is a native of China and Japan, and was brought to the West Indies by Captain Shaddock, from whom it has derived its name



The Italians, according to Dr Sickler, have one, and the French, according to the Nouveau Cours, &c, four sorts Four are grown in the English nurseries

All the sorts may be propagated by seeds, cuttings, layers, and grafting, or inoculation

The object of raising plants from seed is either to obtain new varieties or stocks for grafting To attempt raising new varieties in Britain will in general be found a tedious process, as the trees do not even in Italy show fruit for six or eight years or more, and there is now in the botanic garden at Toulon, a large handsome tree, of twenty-five years' growth, which in 1819 had not blossomed Shaddock stocks are the strongest, and next to these the citron Budding and grafting are performed at the usual season, but these operations may be performed at any time when the sap is in motion

Henderson, of Woodhall, a most superior cultivator of the Citrus tribe, considers cuttings as the quickest mode of getting plants, and has practised it for thirty-seven years past his directions are as follows "Take the strongest young shoots, and also a quantity of the two years old shoots, these may be cut into lengths from nine inches to eighteen inches. Take the leaves off the lower part of each cutting to the extent of about five inches, allowing the leaves above that to remain untouched then cut right across, under an eye, and make a small incision in an angular direction on the bottom of the cutting When the cuttings are thus prepared, take a pot, and fill it with sand, size the cuttings, so that the short ones may be all together, and those that are taller in a different pot Then, with a small dibble, plant them about five inches deep in the sand, and give them a good watering overhead, to settle the sand about them Let them stand a day or two

History, Use, Propagation, Culture,

in a shady place, and if a frame be ready with bottom heat, plunge the pots to the brim Shade them well with a double mat, which may remain till they have struck root, when rooted, take the sand and cuttings out of the pot, and plant them into single pots, in the proper compost. Plunge the pots with the young plants again into a frame, and shade them for four or five weeks, or till they are taken with the pots, when they may be gradually exposed to the light. From various experiments, I found that pieces of two year old wood struck quite well, and in place, therefore, of putting in cuttings six or eight inches long, I have taken off cuttings from ten inches to two feet long, and struck them with equal success Although I at first began to put in cuttings only in the month of August, I now put them in at any time of the year, except when the plants are making young wood By giving them a gentle bottom heat, and covering them with a hand-glass, they will generally strike root in seven weeks or two months The citron is most easily struck, and is the freest grower, I, therefore, frequently strike pieces eighteen inches long, and as soon as they are put into single pots, and taken with the pots, they are grafted with other sorts, which grow freely I am not particular as to the time either of striking cuttings or of grafting" (*Calcd. Hort Mem* iii 308)

At Genoa and Florence, citrus trees are grown in a strong yellow clay, which is richly manured; and this soil is considered by the first Italian gardeners as best suited to their natures.

The French gardeners, in preparing a compost for the orange-tree, endeavour to compensate for quantity by quality, because the pots or boxes in which the plants are placed ought always to be as small as possible, relatively to the size of the tree The following is the composition recommended. to a fresh loam, which contains a third of clay, a third of sand, and a third of vegetable matter, and which has lain a long time in a heap, add an equal bulk of half-rotten cow-dung The following year turn it over twice The succeeding year mix it

10981 Leaves oblong
10982 Leaves smaller oval blunt

§ 1 *Sepals united at base and unequal. Stamens* 00. *Styles* 3-5 ASCYREIA

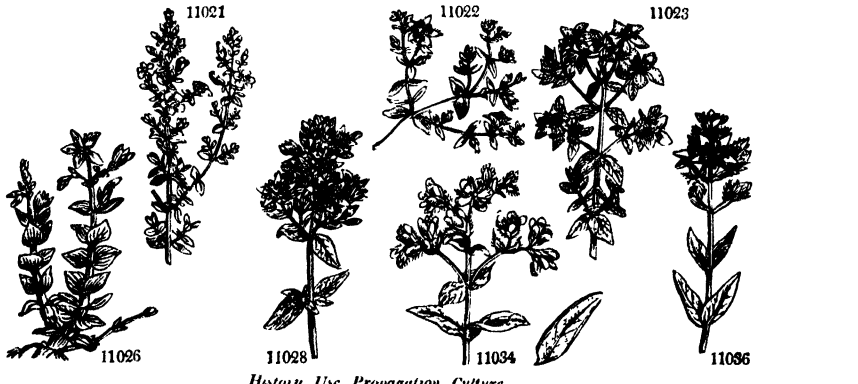
11016 Stem round dotted with black, Leaves ovate obl blunt amplexicaul dotted with black
11017 Stem weak square smooth, Leaves ovate subcordate blunt revolute at edge scarcely dotted beneath

and Miscellaneous Particulars

with nearly one-half its bulk of decomposed horse dung Turn it over twice or three times, and the winter before using add a twelfth-part of sheep dung, a twentieth of pigeon dung, and a twentieth of dried ordure.



Henderson, already mentioned, takes one part of light-brown mould from a piece of ground that has not been cropped nor manured for many years, one part of peat earth, such as is used for growing heaths, two parts of river sand, or pit sand, if it be free from mineral substances, and one part of rotted hot-bed dung, with one part of rotted leaves of trees, and mixes them all well together, so as to form a compost-soil of uniform quality (*Calcd Hort Mem* iii 302)

Though orange-trees will grow exceedingly well in large pots and boxes, yet to have them produce the finest crop of fruit they should be planted in the ground like peach-trees, and trained like them, or as standard cherries in a conservatory. The latter has by far the best effect, especially when the stems of the trees are seven or eight feet high, and the head forms a handsome cone, but the largest fruit is produced when the trees are planted against the back-wall trellis of a narrow house, and treated like peach-trees Henderson grows his largest fruit in this manner, and we have seen them fully as large as any we ever saw at Genoa or Naples.

1616. *Xanthochymus* From ξανθός, yellow, and χύμα, any thing which exudes. in allusion to the color of the juice which flows from the ripe fruit when wounded, and which, being inspissated, yields a material for water-color painting which is as good as Gamboge Handsome plants, of the usual culture in light loam, and propagated by cuttings in sand under a hand-glass

1617 *Hypericum* A name of unknown meaning The species are chiefly under-shrubs, generally with dotted leaves, and almost, without exception, yellow flowers The hardy species are useful for the fronts of

History, Use, Propagation, Culture,

shrubberies H. calycinum soon spreads over a considerable surface, and being evergreen, and growing under the shade, it is well adapted for covering bare spots under trees, and at the base of walls where few plants will thrive

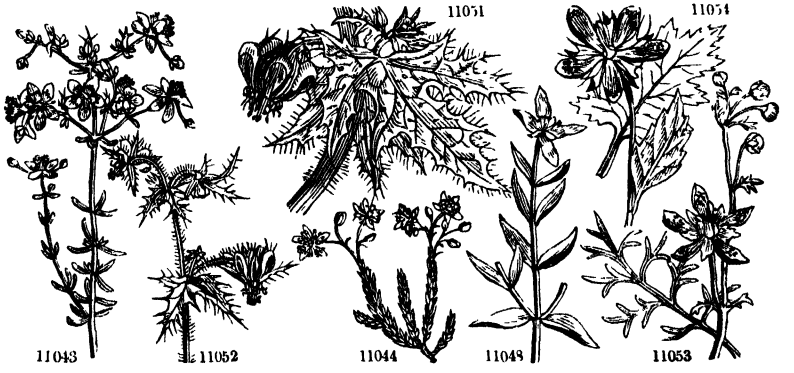
H. Androsæmum, from *ανηρ*, a man, and *αιμα*, blood, because the fresh capsules, bruised between the fingers, give out a blood-colored juice, is called Tutsan from *Toute-saine*, Fr, from its bruised capsules being formerly applied to fresh wounds

H perforatum was formerly used in external wounds and hæmorrhages as a balsamic, and was reputed to have other medical properties The semi-transparent dots on the leaves are the receptacles of an essential oil The flowers tinge spirits and oils of a fine purple color, and the dried plant, boiled with alum, dyes wool of a yellow color The common people in France and Germany gather it with great ceremony on St. John's day, and

11018 Stem round much branched, Lvs sess. lanc. undul. wavy at base with pellucid dots, Cal. very small blunt
11019 Flowers 2-3-gynous terminal, Cal lanc entire, Leaves lanc oblong and erect, Stem simple downy
11020 Stem round, Lvs. lin. lanc with pelluc dots · low closely imbric very short blunt, Cal acute rather unequal
11021 Stem round, Leaves very small ovate close not dotted, Flowers few subsessile, Cal. acute lanceolate
11022 Styles 3, Flowers terminal subcymose, Stems comp. prostrate, Leaves oblong obtuse glabrous
11023 Styles 3, Stem compressed, Leaves elliptico-oblong obtuse with pellucid dots, Cal leaves lanceolate
11024 Stem herbaceous upright 4-winged, Lvs. lin somewhat blunt with fine pellucid dots and black dots beneath
11025 Stem round diffuse, Leaves lanceol. linear narrow at base revolute at edge, Calyx somewhat unequal

** *Sepals toothed, or toothed glandular*

11026 Styles 3, Cal with (reddish) glandular serratures glabrous, Lvs roundish pubesc Stem rounded creeping
11027 Stem downy round ascend Lvs. ovate blunt somewhat amplexicaul with black dots at edge, Cal acuminate
11028 Styles 3, Cal with (black) glandular serratures, Stem erect rounded pubesc. Lvs. ov. slightly downy beneath
11029 Stem round ascending, Leaves orbicular stalked, Calyx ovate blunt
11030 Stem straight slightly wing Lvs ov-lanc subamplex blunt with pellucid dots, Anthers dotted with black
11031 Stem round straight branched, Lvs ellipt lanc. acute glandular at edge with pellucid dots, Cal lanc acute
11032 Stem round a little villous at end, Leaves amplexicaul lanceol. acute generally reflexed, Panic lax few-fl.
11033 Styles 3, Cal with (black) glandul serratures, Stem erect, Lvs cord glab amplexicaul [dots beneath
11034 Sty 3, Corymbs term Cal fring with long pedunc! glands, Stem erect round Lvs ov with (black) scattered
11035 Stem round ascending, Leaves amplexicaul oblong bluntish with pellucid dots. upper sometimes toothed
11036 Styles 3, Pls paniculate-corymb. Cal with glandul. serratures, Stem erect round smooth, Lvs ov glabrous
11037 Stem round purplish simple, Lvs amplexicaul. ovate dotted with black at the edge, Cal. ov. acute ciliated



11038 Stem round, Leaves ovate blunt with a small petiole revolute at edge, Calyx ovate blunt [with black
11039 Stem round slightly winged, Lvs amplexicaul subcord ovate obl blunt with pellucid dots, Anthers dotted
11040 Stem with 2 angles decumbent at base, Lvs linear-lanc spreading blunt revolute at edge, Cal ovate acute
11041 Stem round ascending, Lvs obl. lanc bluntish narrowed at each end with pellucid dots, Cal somewhat blunt
11042 Stem round, Branches somewhat winged, Leaves in threes linear revolute at edge, Calyx very small blunt
11043 Stem round ascending, Leaves whorled linear revolute at edge, Calyx linear somewhat blunt
11044 Stem round tortuous minute, Leaves round acute clustered dotted glaucous very small

§ 5 *Sepals 5, entire, equal, like the leaves Stamens* 00 *Styles* 3-5 BRATHYS

11045 Stem round compressed at end, Leaves dense not dotted channelled revolute at edge, Cal equal straight

11046 Stem small simple quadrangular, Leaves oval blunt fascicled, Pedicels 6 lines long reflexed
11047 Stem round, Branches erect, Lvs ovate linear blunt generally fascicled in the axillæ, Inner sepals orbicular
11048 Stem round, Leaves oblong linear blunt with 2 glands at base, Inner sepals somewhat orbicular
11049 Stem winged straight, Leaves ovate ellipt. blunt glaucous, Inner sepals cordate orbicular
11050 Stem dichotomous panicled, Leaves ovate cordate crisp, Corymb naked, Styles 3

11051 Sepals scarcely toothed reflexed as long as petals, in fruit reflexed and longer than the obovate capsule
11052 Sepals toothed shorter than petals, in fruit erect and shorter than the pear-shaped capsule
11053 Stem twining, Leaves bipinnatifid with narrow obtuse segments
11054 Hispid, Leaves opposite and alternate cordate ovate lobed, Petals flattish, Flower very large

and Miscellaneous Particulars

hang it in their windows as a charm against storms, thunder, and evil spirits, mistaking the meaning of some medical writers, who have fancifully given this plant the name of *Fuga Dæmonum*, from a supposition that it was good in maniacal and hypochondriacal disorders In Scotland it was formerly carried about as a charm against witchcraft and enchantment

H. humifusum is one of the prettiest little plants of the genus, well adapted for growing in pots

1618 *Ascyrum* From α, privative, and σκυρος, roughness, that is to say, a smooth plant, *Linn.* Curious little plants, of the same culture as the Hypericums

1619 *Loasa.* A name applied to these plants by Adanson, but of unknown meaning. Stinging, mostly annual plants, some of the species are handsome hardy annuals, remarkable for the beauty of their highly curious flowers L. volubilis will not succeed in the open air

Class XIX. — SYNGENESIA. Stamens 5. Anthers united by their edges.

This is one of the most extensive and best defined of all the Linnean classes Its essential character depends, as its name indicates, (συν, together, and γενεσις, generation,) upon the adhesion of the antheræ or male organs of the flower into a single tube It comprehends the whole of the Corymbiferæ, Cichoraceæ, and Cinaroce-phalæ of Jussieu, and, with the exception of Aconarpheæ, nothing else The genera constituting the order Monogamia of Linnæus are excluded by Linnean botanists of the present day

In addition to the cohesion of the anthers, upon which this class immediately depends, it is further characterized by the flowers, commonly called florets, being clustered together in heads, and inserted upon a common receptacle, which is surrounded by an involucrum, commonly, but very improperly, termed calyx The few genera, such as Kuhnia, Euxenia, Aconarpha, &c , in which a union of anthers either does not exist at all, or in a very incomplete degree, are therefore retained in Syngenesia, because of their congruity in the structure of their inflorescence

The real nature of the various constituent parts of syngenesious inflorescence being, from its complicated nature, very puzzling to the unlearned, and, as it would seem, to some professors also, it may be useful to explain briefly the analogy the various parts bear to the organs of other plants, and the terms employed in describing them

The *Head* or *Capitulum* is a cluster of flowers of the nature of an umbel, inserted upon a common rachis, which, by contraction or incomplete developement, assumes the form of a conical or flat body, out of which the flowers proceed, and which is called a receptacle This is surrounded by the involucrum M Cassini calls the head *Calathide*

The *Involucrum* is the most external part of the head It consists of a more or less considerable number of scales or leaves, placed in a single row, either distinctly from each other, or united at their edges, in which case the involucrum is called one-leaved, or placed in many rows, becoming gradually shorter as they are external, in which case they are called imbricated If the external scales surround the internal at the base in a regular manner, then the involucrum is said to be calyculate The involucrum was called *common calyx* by Linnæus, and has been more recently denominated a perianthium M Cassini names it *Pericladium*

The *Receptacle* (Chnanthium of Cassini) is a cellular fungous surface surrounded by the involucrum, and bearing the florets It is either columnar, conical, flat, or depressed, and naked, or covered with appendages called hairs or bristles, according to their nature, or paleæ, when they are dilated and have a glumaceous appearance If naked, and merely scarred by the insertions of the florets, it is called dotted or puncticulate, when the scars are more considerable and deeper, the receptacle is said to be scrobiculate, if the insertions are so deep as to appear to be divided by membranous partitions, it is cellular, or favose, or alveolate, if furnished with hairs, it is villose, if with paleæ, it is paleaceous or chaffy

The *Paleæ* are of the same nature as bracteæ, and exist in various degrees of developement Occasionally they are as large as the scales of the involucrum, which they in that case closely resemble

The flower, usually termed *Floret*, consists of two parts, the ovarium and the corolla, each with its appendages

The *Ovarium* is always one-celled, but it occasionally has two additional obsolete cells, as in Arctotis It is either naked, or covered with hairs in various degrees, occasionally becoming enveloped in fine wool, and it is surmounted by an organ named the pappus

The *Pappus* has generally been esteemed a superior calyx, and it is the opinion of M Cassini that it is analogous to the scales of the receptacle, and the leaves of the involucrum

The *Corolla* is placed on the top of the ovarium It is either funnel-shaped, with a limb divided into four or five equal lobes, in which case the florets are denominated *tubular*, or it is split on one side, and spread open into the form of a strap, when the florets are called *ligulate*, or it is divided into two portions, of which one is unequal to the other, this form is called bilabiate or two-lipped Bilabiate corollas may be either ligulate or flosculous, according to the species to which they belong Occasionally the corolla appears to be absent

The *Stamens* are attached to the orifice of the tube of the corolla, just below the limb Their *filaments* are usually, but not always, distinct, their *anthers* are adherent by their edges, and furnished with a little membranous appendage at the tip, and sometimes with two spur-like processes at their base

The *Style* is filiform, and either split at the summit into two linear spreading stigmas, or consists of a single piece from the base to the summit. The form and surface of the stigma, and the upper part of the style are subject to a great diversity of appearances, which are of the utmost importance in determining the affinities of the genera

The *Florets* are either hermaphrodite, unisexual, or neuter Upon these differences of sex the orders of Linnæus are founded

In *Syngenesia æqualis* the florets are all hermaphrodites

In *Syngenesia superflua*, those of the disk or centre are hermaphrodite, of the circumference or ray female, (and *superfluous*)

In *Syngenesia frustranea*, those of the disk are hermaphrodite, of the ray neuter, (and *useless*)

In *Syngenesia necessaria*, those of the disk are male, of the ray female, (and *necessary*)

Syngenesia segregata is only characterized by the heads themselves being clustered and surrounded by a common involucrum

The genera of Syngenesia have always attracted much attention from systematic botanists, who have met with very unequal success in characterizing them. The older botanists comprised them all under a few general heads or names Tournefort, with his usual happiness, pointed out a large proportion of the most natural genera. Vaillant established a considerable number Linnæus, profiting by the labours of his predecessors, rejecting some genera, and dividing others, increased their number, and adapted them to his sexual system, in nearly the same order in which they exist at the present day Jussieu, by applying to the genera the principles of his natural method, reduced them to an arrangement much superior in point both of facility and of natural affinity to that of his northern rival. But however meritorious the labours of these great systematists may have been, much remained to be effected, even among their own plants, by those who followed them. The indefatigable Gartner, who worked upon the only satisfactory or philosophical principles that of strict analysis, soon discovered that the combinations of Linnæus and Jussieu were often too vague and ill defined to accord with his notions of accurate subdivision Hence many other genera arose But since his days, the extent of Syngenesia has, like all other parts of botanical science, increased exceedingly, and has arrived in our days at a state little short of absolute confusion Injudicious or superficial botanists, impressed with the fear of innovation, and with a pious reverence even for the errors of those who went before them, have from time to time crowded the genera of Jussieu and Linnæus with the most incongruous species, and so have rendered many of those which were originally pure and simple, heterogeneous masses of species Much has been done by our learned countryman, Mr Robert Brown, to reduce to order this class of individuals, and, as far as his published observations have extended, with the happiest success In France, an ingenious and accurate observer, Mr Henry Cassini, has undertaken a revision of the whole class, upon principles peculiar to himself; and it must be allowed, that what he has executed has given ample room for regret that he has not published more Unfortunately, his observations are scattered over the face of many books, and are in no case in such a state of arrangement as to be extensively useful It is hoped that a period will soon arrive when he, or at least some

of his countrymen, will place in one view the result of his labours, so as to enable the world to judge with more accuracy, both of their extent, and of their real importance in defining the limits of the genera and their orders The style and stigma, which had been previously almost overlooked, have furnished M Cassini with what appear to be beautiful distinguishing marks of his orders, and it is upon these organs that much of the peculiarity of his arrangement depends. In the mean while, till it can be ascertained what the ultimate division of Compositæ is likely to be, it has been considered more prudent in this work to indicate none of the divisions of either M Cassini, or of his fellow labourers in France or elsewhere

In a popular point of view, Syngenesia may be considered interesting in a high degree It abounds in plants of ornament, all of which are, without exception, of easy cultivation It is not necessary to particularize the merits of the brilliant varieties of the Dahlia, or of the Chinese Chrysanthemum, which are the chiefest ornaments of every autumnal garden, nor to point out the beauty of the various tribes of Aster, Helianthus, Coreopsis, Xeranthemum, or Gnaphalium These and an hundred others must be familiar to every lover of gardening It is, however, worth remarking, that nearly all syngenesious plants are autumn flowers In the tropics, many become trees of considerable dimensions, in temperate climates, they are mostly herbaceous or low bushes

With regard to the qualities of syngenesious plants, considered economically or medicinally, it may be stated, that, whatever they may be, they consist in a bitter principle, and an oily secretion But these vary in particular tribes In some the bitter is combined with a resinous principle, by which its powers are increased in different degrees In those plants in which the resin is found in small quantities only, and mixed with a bitter or astringent mucilage, tonic, stomachic, and febrifugal properties seem to be acquired, as in the camomile, the golden rod, the feverfew, and the Eupatorium perfoliatum, and the stimulant powers of these plants appear to increase in proportion as the resin is abundant Some kinds are anthelmintic, as the wormwood and tansy, others are emmenagogue, as the feverfew, the yarrow, and various kinds of wormwoods Certain species possess sudorific qualities, as the Eupatorium, the yarrow, the wormwood, and the marigold, others, again, are powerful diuretics, as Liatris, while stimulating powers exist in considerable activity in others, as in the Sneezewort and Arnica The Spilanthus, Anthemis, Pyrethrum, and some others, excite salivation The Eupatorium Ayapana of Brazil, and the Guaco of Peru, which is another species of Eupatorium, are most powerful alexiterics According to the analysis of M Braconnot, the wormwood owes its bitterness to an extremely bitter animalized matter, which forms a little less than one fifth of its weight, the same chemist also states that plant to contain a volatile oil, and an acid, apparently new, which is found in combination with potash Before the perfect developement of the leaves, the bitter principle is so much diluted with insipid mucilage, that the young shoots of some of the thistle tribe, the Cardoon for example, are used for culinary purposes, and it is probable, that it is owing to the small proportion which the bitter bears to the whole mass, that the receptacle of the artichoke, of the Onopordum, and of the cotton thistle, is found fit for food The corollas of the Cardoon, and of many thistles, have the power of curdling milk The juice of the lettuce and other cichoraceous plants is milky, bitter, astringent, and narcotic In a wild state, the narcotic principle is so abundant, that the inspissated juice of Lactuca virosa has been used as a substitute for opium, and with much success But under the effect of cultivation, the mucilage is so much more abundant than any other substance that the same species often form well-known articles of wholesome and agreeable food And, indeed, under any circumstances, wild or domesticated, the young shoots, when the narcotic principle is scarcely developed, are frequently eaten with safety, it is for the same reason, namely, the incomplete formation of the bitter principle, and the superabundance of mucilage, on account of the absence of light, that the blanched leaves of cardoons and chicory, and the white roots of the Scorzonera and the Salsafy, are capable of being eaten without inconvenience The seeds of all syngenesious plants abound in oil, which is expressed from those of the Madia of Chili, the Verbesina sativa, and the common sunflower Owing to the difficulty of procuring this oil in a pure state, its virtues are not ascertained with much accuracy They are generally believed to be slightly purgative and diaphoretic

Order 1  ÆQUALIS

Flowers of the disk and ray all hermaphrodite

1620 *Geropogon.* Receptacle setose-paleaceous Involucre many-leaved, simple, or with bracteolæ Pericarps of disk with branched pappus, of the ray with five awns

1621 *Tragopogon* Involucre simple, of many leaves Receptacle naked Pappus feathery, stipitate Pericarps longitudinally striated

1622 *Tolpis* Involucre oblong, conical, simple, or imbricated with unequal scales Receptacle naked, dotted Pappus sessile, hairy

1623 *Anapogon* Receptacle naked Pappus feathery, stipitate Involucre 1-leaved, 8-parted, turbinate

1624 *Podospermum* Receptacle warted Pericarps cylindrical on a long stalk Leaves finely cut Otherwise as Scorzonera

1625 *Scorzonera* Receptacle naked Pappus feathery, somewhat stalked Involucre imbricated, with scales scarious at edge

1626 *Picridium* Involucre ventricose at base, imbricated with broadish scales, membranous at edge Pappus sessile, villous, simple Pericarps 4-cornered, warted across

1627. *Sonchus* Involucre imbricated, swelling at the base Receptacle naked Pappus simple, sessile

1628 *Lactuca* Involucre imbricated, cylindrical, its scales with a membranous margin Receptacle naked Pappus simple, stipitate

1629 *Chondrilla* Receptacle naked Involucre with bracteolæ Pappus simple, stalked Florets in many rows Pericarps muricated

1630 *Prenanthes* Involucre with scales at the base Receptacle naked Pappus simple, sessile Florets few

1631. *Leontodon* Involucre with scales that are frequently lax and flaccid Receptacle naked Pappus simple, stipitate

1632 *Apargia.* Involucre imbricated with scales at the base. Receptacle naked, dotted. Pappus feathery, sessile, unequal

1633. *Thrincia* Receptacle favose Pappus of the ray membranous, multifid, of the disk stalked, feathery Involucre with 8 angles and 8 leaves

1634 *Picris* Calyx double, the inner equal, the outer lax Receptacle naked. Pappus feathery Pericarps transversely striated

1635. *Hieracium* Involucre ovate, imbricated. Receptacle nearly naked, dotted Pappus simple, sessile.

1636 *Lagoseris* has the characters of Crepis, but the pappus is stalked

1637 *Borkhausia.* Involucre oblong in two rows, the outer much shorter than the inner. Receptacle alveolate Pappus of the centre stalked, of the circumference sessile or subsessile

1638. *Crepis* Involucre surrounded with deciduous scales, and at length swelling into protuberances Receptacle roughish Pappus sessile

1639. *Helminthia* Receptacle naked Involucre double outer 8-leaved, equal; inner 5-leaved, as long as outer Pericarps striated across Pappus stalked, feathery

1640 *Myoseris* Receptacle paleaceous Paleæ capillary Involucre calyculated Pappus hairy, sessile.

1641. *Tolpis* Receptacle favose Involucre with bracteolæ, which are subulate, and as long as involucre Pappus of the ray toothed, of the disk with 2 or 4 awns

1642. *Andryala.* Receptacle villous. Involucre many-parted, nearly equal, rounded. Pappus simple, sessile.

1643. *Rothia.* Recept. villous, chaffy at edge Invol. many-leaved, equal Pappus hairy, of the disk sessile, of the ray none.
1644 *Krigia.* Recept. naked. Pappus membranous, 5-leaved, with 5 bristles between Invol. many-leaved, simple
1645. *Hyoseris* Recept naked. Invol with bracteolæ. Pappus double: exterior capillary; interior paleaceous, awned
1646. *Hedypnois* Recept naked Invol with bracteolæ Pappus of disk double: outer obsolete, of many bristles, inner paleaceous, 5-leaved, of the ray a membranous toothletted margin
1647. *Robertia.* Invol many-leaved, equal Recept. scaly. Pappus feathery, the hairs being slightly membranous at base
1648 *Serisola* Recept paleaceous. Invol simple Pappus somewhat hairy
1649 *Soldevilla* Invol imbricated, in fruit ventricose at base, with scales conniving at end. Recept. paleaceous, paleæ very short, setose. Pappus O.
1650 *Hypochæris* Involucre oblong, imbricated Receptacle chaffy Pappus feathery, stipitate, or sessile
1651 *Lapsana* Involucre with scales at the base. Receptacle naked (its inner leaves equal, channelled, *Sm.*) Pericarps destitute of pappus (deciduous)
1652 *Zacintha* Recept naked Pericarps of the ray incurved, of the disk straight. Pappus very short, somewhat feathery. Invol with bracteolæ, which are membranous
1653 *Rhagadiolus* Recept. naked Pericarps arcuate, spreading Pappus O Invol with bracteolæ
1654 *Moscaria* Invol 6-leaved, equal Recept flat, paleaceous External pericarps with a short feathery pappus, central with none.
1655 *Catananche* Recept paleaceous Invol. imbricated, scarious Pappus paleaceous, 5-leaved, paleæ awned
1656 *Tripolium* Invol imbricated, the exterior scales somewhat squarrose Florets bilabiate: the upper lip 3-toothed, lower entire revolute Recept. villous Pappus with 3 feathers
1657 *Cichorium* Involucre surrounded with scales or smaller leaflets Receptacle naked or slightly hairy. Pappus sessile, scaly, shorter than the pericarp
1658 *Bacasia* Invol imbricated, scarious Florets, one in the middle large tubular, the others 4-toothed, with a revolute bristle inserted in the mouth of the tube Recept pilose Pappus feathery
1659 *Scolymus* Receptacle paleaceous Invol imbricated, spiny Pappus O
1660 *Arctium* Involucre globose, each of its scales with an incurved hook at the extremity Receptacle chaffy Pappus simple
1661 *Serratula* Involucre cylindrical, imbricated with scales that are not spinous Receptacle chaffy Pappus roughish or feathery, rigid, persistent
1662 *Saussurea* Involucre imbricated, not spiny, outer scales acute, inner obtuse, membranous Pappus feathery, in two rows, the exterior being shortest, the inner somewhat united at base
1663 *Carduus* Involucre swelling, imbricated with spinous scales Receptacle hairy Pappus deciduous, roughish
1664 *Silybum* Invol ventricose, imbricated: outer leaves with appendages at end, inner cochleate. Recept. chaffy Pappus linear, chaffy, deciduous
1665 *Cnicus* Involucre swelling, imbricated with spinous scales Receptacle hairy Pappus deciduous, feathery
1666 *Onopordum* Involucre swelling, its scales spreading, and spinous Receptacle cellular Pappus deciduous, rough
1667 *Berardia* Invol imbricated with linear unarmed scales Recept somewhat favose, naked Pappus hairy, generally twisted spirally, persistent
1668 *Cynara* Recept setose Invol dilated, imbricated, scales fleshy, emarginate, with a point Pappus sessile, feathery
1669 *Carlina* Involucre swelling the exterior scales with numerous spines, the inner ones colored, scariose
1670 *Atractylis* Recept paleaceous Pappus feathery Invol imbricated with bracteolæ Florets of ray 5-toothed
1671 *Acarna* Recept paleaceous Pappus feathery Invol imbricated with bracteolæ Florets flosculous
1672 *Stokesia* Recept naked Pappus with 4 bristles Invol leafy, somewhat imbricated Heads radiated florets of ray funnel-shaped, irregular
1673 *Stoba a* Invol imbricated, with toothed spiny scales Florets flosculous. Recept hispid, favose Pappus paleaceous
1674 *Onobroma* Invol ventricose outer scales large, herbaceous, spiny, acuminate; inner coriaceous, unarmed. Recept paleaceous. Pappus setaceous, rigid, unequal
1675 *Carthamus* Recept paleaceous, setose Invol ovate, imbricated, scales ovate, leafy at end Pappus paleaceous, hairy, or none
1676 *Cardopatum.* Invol 6-8-fl many-leaved, imbricated, the outer scales branched, spiny Recept paleaceous, with long fasciculed paleæ Pericarps villous
1677 *Stæhelina* Recept with very short paleæ Pappus feathery Anthers awned at base Invol. hemispherical, imbricated
1678. *Palafoxia* Invol oblong, somewhat imbricated, 8 or many-leaved, many-flowered Cor flosculous, longer than calyx, with a 5-fid limb Pappus chaffy Receptacle naked Fruit marginal, wrapped up in the involucre
1679 *Pteronia.* Recept paleaceous, paleæ many-parted Pappus somewhat feathery Invol imbricated with keeled scales
1680 *Vernonia* Recept naked Invol ovate, imbricated Pappus double outer paleaceous, inner capillary
1681 *Ammobium* Invol imbricated, colored, radiant Anthers with 2 bristles at the base Chaffs of receptacle distinct Pappus a toothed edge
1682 *Liatris* Recept naked Invol oblong, imbricated Pappus feathery
1683 *Mikania* Recept naked Invol 4-6-leaved, equal, 4 or 6-flowered Pappus hairy
1684 *Sparganophorus* Invol subglobose, imbricated with unequal scales, recurved, spreading at end Recept naked Pericarps crowned with a somewhat cartilaginous cup
1685 *Eupatorium* Involucre imbricated, oblong Florets few Receptacle naked Pappus rough
1686 *Dumerilia* Invol many-parted, equal Receptacle paleaceous Florets bilabiate Anthers spurred at base Pappus feathery, sessile
1687 *Ageratum* Recept naked Pappus with 5 somewhat-awned paleæ Invol oblong in a double row. Corollas 4-5-fid
1688. *Cælestina* Invol cylind many-leaved, imbricated Recept convex, naked Florets all tubular. Stigmas very long, spreading Pericarps truncate, 5-cornered Pappus a membranous rim.
1689 *Stevia* Recept naked Pappus paleaceous Invol cylindrical in a single row
1690 *Cephalophora* Recept naked, hemispherical Pappus paleaceous, many-leaved. Invol many-leaved, reflexed
1691. *Amphiepis.* Invol hemispherical, imbricated Recept flat, naked Florets all tubular Pericarps cylindrical, naked Pappus hairy, deciduous
1692 *Hymenopappus* Invol many-leaved, spreading, scales ovate, colored Recept. naked Pappus many-leaved, paleaceous
1693 *Melananthera* Recept paleaceous, convex Invol many-leaved, in a double row Pappus of from 2 to 18 rough bristles Pericarps turbinate, angular

1694. *Marshallia.* Recept. paleaceous. Pappus of 5 membranous acuminate paleæ. Involl. imbricated; scales somewhat lanceolate, incumbent.
1695 *Spilanthes.* Recept. paleaceous, conical. Pappus with 2 awns, one smaller than the other. Involl. nearly equal.
1696. *Salmea.* Recept conical, paleaceous Pappus with 2 awns. Pericarps depressed. Involl imbricated
1697 *Bidens* Involucre of many leaves, with many foliaceous bracteas at the base Receptacle plane, chaffy Cor. sometimes radiant. Pericarps crowned with from 2-5 persistent awns, which are rough, with minute deflexed bristles
1698 *Platypteris* Involl many-leaved, imbricated, squarrose. Recept. convex, paleaceous. Pericarps compressed, winged, with 2 awns at top.
1699 *Lagascea.* Involl. 1-leaved, tubular, 1-flowered, divided at end. Floret tubular, hermaphrodite. Pericarps linear, cuneate, compressed Pappus a small fringed crown
1700 *Lavenia.* Recept. naked. Pappus with 3 awns, glandular at end. Involl. ovate, somewhat imbricated.
1701. *Cacalia* Recept naked, Pappus pilose Involl. cylindrical, oblong, at the base only with bracteolæ.
1702 *Klenia.* Recept. naked Pappus hairy Involl simple, equal, 5-leaved
1703. *Ethulia* Recept naked Pappus a very narrow rim. Involl equal, in a double row.
1704 *Psqueria* Recept. naked. Involl equal, 4-leaved, 4-flowered, Pappus none. Pericarps pentagonal.
1705 *Chrysocoma* Recept naked Pappus simple Involl hemispherical, imbricated Style scarcely longer than florets
1706 *Tarchonanthus.* Recept. villous. Pericarps enveloped in hair Involl 1-leaved, half 7-fid, turbinate.
1707 *Calea* Recept paleaceous. Pappus hairy Involl imbricated
1708 *Isocarpha* Recept paleaceous conical, the outer paleæ forming the involucrum Pappus O Anthers not spurred at base Stigmas with a long appendage
1709. *Petrobium* Recept. paleaceous, flattish Involl many-leaved, in 2 rows: outer row shortest Pericarps angular Pappus awned
1710 *Neurolæna.* Recept paleaceous, flattish Pappus capillary, toothletted, persistent Involl. imbricated, leafy Anthers awnless at the base
1711 *Humea* Recept minute, glandular Pappus none Involl. loosely imbricated, membranous. Florets about 3, tubular Anthers awned
1712 *Cæsulia* Recept paleaceous. paleæ enveloping the pericarps Pappus O. Involl 3-leaved
1713. *Ixodia* Recept paleaceous Pappus O Involl imbricated inner scales radiant colored.
1714 *Santolina* Recept paleaceous Pappus O Involl imbricated, hemispherical
1715 *Otanthus* Involl. hemispherical imbricated Florets with 2 appendages at base Recept convex, paleaceous Pappus O
1716 *Calractc* The same as Calea, but it has a radius of ligular female florets
1717 *Athanasia* Recept paleaceous Pappus paleaceous, very short Involl imbricated
1718 *Balsamita* Recept naked. Pappus O Involl imbricated
1719 *Pentzia.* Recept naked Pappus a membranous torn rim. Involl imbricated, hemispherical.

SUPERFLUA

§ *Florets of the disk hermaphrodite: of the ray female*

1720 *Tanacetum* Involl hemispherical, imbricated Recept naked Florets of the ray trifid, obsolete sometimes wanting Pericarps crowned with a membranous margin or pappus
1721 *Artemisia* Involl ovate or rounded, imbricated Recept naked (or downy, *Sm*) Florets of the ray subulate Pericarps crowned with a membranaceous pappus
1722 *Gnaphalium.* Recept naked Pappus hairy or feathery Involl imbricated marginal scales round, scarious, colored
1723 *Leontopodium* Heads sessile in the leaves Involl woolly Florets 5-fid. Pappus pencilled or hairy Otherwise Gnaphalium
1724 *Evax* Heads surrounded by bracteæ Involl ovate, imbricated, with appressed acuminate scales Florets of disk 4-toothed. of the ray not toothed Recept subulate, paleaceous Pericarps of the female flowers without pappus
1725 *Antennaria* Recept scrobiculate Pappus capillary Involl imbricated, scarious, colored Anthers spurred at base Florets dioecious
1726 *Metalasia* Involl cylindrical, radiant colored Pappus deciduous, capillary, clavate Florets few, hermaphrodite Otherwise as Gnaphalium
1727 *Astelma* Recept naked Pappus feathery, sessile · rays connate at base. Involl imbricated with scarious scales, the interior of which are connivent
1728. *Athrixia* Heads radiant Involl obl. imbricated, awned, squarrose. Florets bilabiate. Pappus feathery Recept. alveolate.
1729 *Xeranthemum* Recept paleaceous Pappus paleaceous-setaceous Involl imbricated, radiated. with a colored ray
1730 *Elichrysum* Recept naked Pappus hairy or feathery Involl imbricated, radiated ray colored
1731 *Carpesium* Recept. naked Pappus O Involl imbricated, with the outer scales reflexed
1732 *Baccharis* Recept. naked Pappus pilose Involl imbricated, cylindrical Female florets mixed with the hermaphrodite ones
1733 *Molina* Involl campanulate, imbricated Pappus feathery Recept convex, naked, dotted. Flowers dioecious
1734. *Conyza.* Involl roundish, imbricated Recept. naked Florets of the ray 3 cleft. Pappus rough
1735 *Madia* Recept naked Pappus O Involl double outer 8-10-leaved, equal, longer than the inner, which is many-leaved
1736 *Erigeron* Involl imbricated Recept naked Florets of the ray numerous, very narrow, mostly of a different color from the disk Pappus simple
1737 *Tussilago* Involl simple, equal, submembranaceous, swelling Recept naked Pappus simple
1738 *Senecio* Involl subcylindrical, equal, scaly below, the scales withered at the tip Recept naked Pappus simple
1739 *Aster.* Involl imbricated, its lowermost scales spreading (except in A trifolium). Recept. naked Florets of the ray more than 10 Pappus simple
1740 *Solidago* Involl imbricated, its scales connivent. Recept naked Florets of the ray (of the same colour as the disk) about 5. Pappus rough
1741 *Cineraria* Recept naked Pappus simple Involl simple, many-leaved, equal
1742 *Calotis* Recept naked. Pericarps crowned with two opposite paleæ and 1-3 barbed awns. Involl nearly equal, many-leaved, in a single or double row
1743 *Kaulfussia* Involl simple leaflets keeled Recept. naked, convex Pappus of the ray a minute fringed rim, of the disk stiff and feathery
1744 *Inula* Involl imbricated Recept naked Florets of the ray very numerous, linear. Anthers with 2 bristles at the base Pappus simply composed of hairs
1745. *Pulicaria* Involl roundish, imbricated · scales linear, acuminate. Recept. naked. Pappus compound · outer a membranous cup, inner setaceous Pericarps uniform
1746 *Grindelia* Recept naked Pappus setaceous, deciduous Involl imbricated, hemispherical

1747. *Podolepis.* Recept. naked. Pappus hairy. Involucre imbricated, scarious, hemispherical: scales unguiculate

1748 *Chætanthera* Involucre many-leaved, ciliated Florets of ray linear, 3-toothed, with a fine bifid spiral segment at the divisions. Anthers spurred at base. Recept. naked, flat Pappus hairy

1749. *Arnica* Recept naked. Pappus simple Involucre with equal leaves Florets of ray generally with 5 filaments without anthers

1750 *Gerberia.* Florets bilabiate, those of the ray ligulate. Involucre imbricated, coriaceous Recept flat, naked. Pappus with long bearded paleæ

1751 *Doronicum* Scales of the involucre in 2 equal rows, longer than the disk. Recept naked. Pericarps of the disk crowned with a simple pappus, those of the ray without a pappus.

1752. *Perdicium* Recept naked Pappus hairy. Florets 2-lipped

1753 *Tetragonotheca* Recept paleaceous. Pappus O Involucre 1-leaved, 4-cornered, 4-parted.

1754. *Xamenesia* Recept paleaceous Pappus O Pericarps of ray naked, emarginate; of the disk winged. Involucre many-leaved, nearly equal

1755. *Helenium* Recept naked, of the ray paleaceous Pappus 5-awned. Involucre 1-leaved, many-parted. Florets of ray half-trifid

1756 *Bellis* Involucre hemispherical, its scales equal Recept naked, conical

1757 *Bellium* Recept naked Pericarps conical, with a paleaceous 8-leaved crown and awned pappus. Leaves of involucre equal

1758 *Dahlia* Recept paleaceous Pappus O Involucre double outer many-leaved, inner 1-leaved, 8-parted

1759 *Ræbera* Involucre double outer many-leaved, inner 8-leaved Recept naked Pappus hairy

1760 *Tagetes* Recept naked Pappus with 5 erect awns Involucre simple, 1-leaved, 5-toothed, tubular. Florets of ray 5, persistent.

1761 *Heterospermum* Recept naked Outer grains compressed with a membranous edge, inner oblong with two awns Involucre double outer 4-parted, inner many-leaved

1762 *Schkuhria* Recept naked Pappus paleaceous Involucre 5-leaved Florets of ray solitary.

1763 *Pectis* Recept naked Pappus with 3 or 5 awns Involucre 5-leaved Florets of ray 5

1764 *Longchampsia* Differs from Pectis and Leysera, in having a double pappus, the exterior of which is edged, the inner feathery

1765 *Leysera* Recept. somewhat paleaceous Pappus paleaceous of the disk feathery Involucre scarious

1766 *Selloa* Involucre imbricated, ovate Recept naked Pappus O Female florets inconspicuous, mixed among the leaves of the involucrum

1767 *Bethania* Recept. paleaceous Pappus membranous, cylindrical, short. Involucre imbricated, scarious Rays numerous.

1768 *Zinnia* Recept paleaceous Pappus with 2 erect awns Involucre ovate, cylindrical, imbricated Florets of ray 5, persistent, entire

1769 *Chrysanthemum* Involucre hemispherical, imbricated with scales whose borders are membranous. Recept naked. Pappus none

1770 *Pyrethrum* Recept hemispherical, imbricated with scales whose borders are membranous. Recept naked Pericarps crowned with a membranous margin

1771 *Matricaria* Involucre hemispherical or almost plane, imbricated with scales whose borders are membranous Recept naked, almost cylindrical Pappus none

1772 *Boltonia* Recept favose, hemispherical Pappus toothed, awned, somewhat 2-horned Rays numerous Involucre imbricated

1773 *Ludbeckia* Recept naked Pappus O Pericarps angular, with the lowest joint of style persistent. Rays numerous Involucre many-parted

1774 *Cenia* Involucre fruit turbinate, multifid Florets of ray very numerous, short Recept naked Pericarps compressed

1775 *Cotula* Recept nearly naked Pappus margined Florets of disk 4-fid, of the ray scarcely any

1776 *Grangea* Involucre imbricated, spreading Marginal florets 3-toothed Recept hemispherical Pericarps with a toothed edge at top

1777 *Anacyclus* Recept paleaceous Pappus emarginate Pericarps with membranous edges

1778. *Anthemis* Involucre hemispherical, its scales nearly equal, their margins scarious. Recept convex, chaffy Pericarps crowned with a membranous border or pappus

1779 *Centrospermum* Involucre hemispherical, of many imbricated, round, scarious scales Recept naked Pappus spiny. Outer pericarps cymbiform, smooth

1780 *Santolina* Recept paleaceous Pericarps of ray with 3 awns of the side naked, warted, of the disk winged Involucre imbricated, flat.

1781 *Achillea* Involucre ovate, imbricated, unequal Recept plane, chaffy Florets of the ray 5-10, roundish, obcordate Pericarps naked

1782 *Tridax* Involucre cylindrical, imbricated, with ovate oblong scales Florets of ray 3-parted Recept. paleaceous Pappus hairy, simple

1783 *Amellus* Recept paleaceous Pappus simple Involucre imbricated Florets of ray undivided

1784 *Staukea* Recept hirsute Pappus sessile, hairy Involucre imbricated

1785 *Columellia* Involucre cylindrical, imbricated Florets of ray undivided Recept naked, favose. Pappus a toothed edge

1786 *Eclipta* Recept paleaceous Pappus O Florets of disk 4-fid

1787 *Meyera* Involucre 4-leaved, the 2 inner smallest. Recept small, paleaceous, 2 paleæ enveloping the pericarp, keeled Pappus O

1788 *Chrysanthellum* Involucre cylindrical, about as long as florets, scaly at base Recept paleaceous Florets numerous, linear, 2-toothed, short, of the centre few, and generally abortive. Pericarps naked, roundish, furrowed, with an entire edge

1789 *Siegesbeckia* Recept paleaceous Pappus O Outer involucre 5-leaved, inner spreading. Ray halved

1790 *Verbesina* Recept paleaceous Pappus awned Involucre in one row Florets of the ray about 5

1791 *Synedrella* Involucre generally of 2 leaves Florets flosculous Recept obsolete, paleaceous paleæ glumaceous, the outer ovate Pericarps oval, flat, edged, the central dissimilar, near, oblong, with 2 or 3 awns.

1792 *Galinsoga* Recept paleaceous Pappus many-leaved, paleaceous Involucre imbricated.

1793 *Acmella* Involucre simple, with a few somewhat leafy divisions Recept. oblong, paleaceous. Heads radiant Pericarps 4-cornered, truncate at end, naked

1794 *Zaluzania* Involucre with distinct, somewhat ovate, equal segments Head radiant Recept. conical, paleaceous, paleæ membranous, trifid, involving the pericarps, which are 4-cornered and naked

1795 *Pascalia* Recept paleaceous Pericarps drupaceous Pappus a toothed rim Involucre imbricated

1796 *Heliopsis* Involucre imbricated, with ovate lined squamæ Cor of ray linear, large Recept paleaceous, conical, with lanceolate paleæ Pericarps 4-cornered. Pappus O

1797 *Buphthalmum* Recept. paleaceous Pappus an obsolete rim. Sides of pericarps, especially of the ray, edged

Order 3  FRUSTRANEA

Florets of the disk fertile: of the ray sterile.

1798. *Helianthus* Recept paleaceous, flat Pappus 2-leaved. Involucre imbricated, subsquarrose

1799 *Gymnoloma* Involucre hemispherical, loosely imbricated Recept. convex, paleaceous. Central florets sterile, marginal radiant. Pappus O

1800 *Rudbeckia* Recept. paleaceous, conical. Pappus with a 4-toothed rim Involucre with a double row of scales

1801 *Galardia.* Recept. paleaceous, hemispherical Pappus paleaceous, many-leaved. Involucre imbricated, many-leaved, flat. Rays 3-parted

1802 *Tithonia* Involucre many-leaved, cylindrical Rays 3-toothed. Recept paleaceous, convex. Pappus paleaceous, 5-leaved.

1803 *Cosmea* Recept paleaceous Pericarps 4-cornered Pappus with 2 or 3 awns. Involucre double, each 1-leaved, 8-parted

1804 *Coreopsis* Recept paleaceous. Pericarps compressed, emarginate Pappus with 2 horns. Involucre double, each many-leaved

1805. *Simsia* Involucre subcylindrical, nearly equal, with linear lanceolate incumbent scales. Recept. paleaceous Pericarps flattish, somewhat edged, each edge awned

1806 *Osmites* Recept paleaceous Pappus obsolete Florets of ray ligulate Involucre imbricated scarious

1807. *Encelia.* Recept paleaceous. Pappus O Pericarps vertical, flat, with a ciliated edge Involucre imbricated

1808 *Sclerocarpus* Recept paleaceous Pappus O Involucre double, each 3-leaved

1809 *Cullumia* Recept. favose Pericarps smooth Pappus O Involucre 1-leaved, covered with imbricated leaflets

1810 *Berckheya* Recept favose Pericarps villous Pappus paleaceous (sometimes bristly-paleaceous, ciliated) Involucre 1-leaved, covered with imbricated leaflets

1811 *Dudelta* Recept favose, inclosing the pericarps. Pappus many-parted, setaceous, paleaceous, toothed Involucre 1-leaved, covered with leaflets, the exterior very large

1812 *Gorteria* Recept scrobiculate Pappus a ciliated edge Involucre 1-leaved, covered with imbricated leaflets, of the fruit indurated, connivent, deciduous

1813 *Gazania* Recept naked, or alveolate Pericarps very villous Pappus hairy-paleaceous Involucre 1-leaved, the tube naked, or covered with imbricated leaflets

1814 *Cryptostemma.* Recept favose Pappus paleaceous, covered by the entangled wool of the pericarp Involucre imbricated

1815. *Arctotheca.* Recept favose Pappus O Involucre imbricated

1816 *Sphenogyne* Recept with distinct paleæ Pappus paleaceous, simple Stigmas with a dilated truncated end Involucre imbricated, the inner scales or all with a dilated scarious end

1817 *Zoegea* Recept setose Pappus setaceous Rays ligulate Involucre imbricated

1818 *Leuzea* Involucre imbricated, spherical, not spiny Recept bristly Pappus feathery, in many rows Florets all hermaphrodite

1819 *Centaurea* Involucre scaly Recept bristly Corollas of the ray infundibuliform, irregular, longer than those of the disk Pappus simple

1820 *Galactites* Involucre imbricated, with somewhat squarrose spiny scales Recept favose Pappus feathery, deciduous

1821 *Wedelia* Involucre 5-leaved, with broad leafy segments Recept. paleaceous Florets of the centre generally abortive, of the ray many, oval, 2-3-fid. Stigmas setaceous. Pappus stipitate, membranous, toothletted

Order 4  NECESSARIA

Florets of the ray female fertile of the disk male.

1822. *Melleria* Recept naked Pappus O Involucre of 3 valves Ray halved

1823 *Baltimora* Recept paleaceous Pappus O Involucre cylindrical, many-leaved Ray 5-flowered

1824 *Sulphium* Recept paleaceous Pappus with a 2 horned edge Involucre squarrose

1825. *Tyzis* Involucre imbricated Cor of ray 3-fid Recept paleaceous Pappus O Pericarps villous at end

1826 *Polymnia* Recept paleaceous Pappus O Involucre double outer 4 or 5-leaved, inner 10-leaved, with common leaflets

1827 *Chrysogonum* Involucre 5-leaved. Recept paleaceous Pappus 1-leaved, 3-toothed Pericarps with a little 4-leaved calyx

1828 *Melampodium* Recept paleaceous, conical Pappus 1-leaved, vulviform Involucre 5-leaved

1829 *Chaptalia* Recept naked Pappus capillary Florets of the ray in a double row, deformed, of the disk bilabiate

1830 *Calendula* Recept naked Pappus O Involucre many-leaved, equal Pericarps of the disk membranous

1831 *Arctotis* Recept setose-alveolate Pericarps half 2-celled, or 2-furrowed at the back Pappus paleaceous Involucre imbricated, with scales scarious at end

1832. *Osteospermum* Recept naked Pappus O Involucre many-leaved Pericarps globose, colored, bony.

1833 *Othonna* Recept naked Pappus hairy Involucre 1-leaved, many-cut

1834 *Hippia.* Recept naked Pappus O Pericarps with very broad edges, naked. Involucre hemispherical, somewhat imbricated Florets of ray 10, obsoletely trifid

1835. *Solva* Involucre 7-leaved, leaflets with imbricated edges, the 3 outer largest Ray none Recept very small, somewhat villous Pericarps compressed, surrounded by a membrane, crowned by 2 prickles and the style

1836. *Psadia* Recept naked Pappus hairy, sessile Involucre imbricated, ovate Florets of ray short

1837. *Eriocephalus* Recept paleaceous Pappus O Involucre double inner 1-leaved, outer 5-leaved.

1838 *Filago.* Recept paleaceous Pappus O Involucre imbricated Female florets mixed among the scales of involucre

1839 *Micropus* Recept. paleaceous Pappus O Involucre calyculate Rays none Female florets enwrapped in the scales of involucre

1840 *Parthenium* Recept paleaceous, flat Pericarps obovate, nearly naked Involucre 5-leaved.

1841. *Iva* Recept pilose Pericarps naked, blunt Involucre 3-leaved Florets of ray 5 Styles 2, long.

1842 *Acicarpha* Involucre 5-parted Cor all tubular. Recept paleaceous, the palea being united with the pericarps after flowering. Pappus O. Stamens half-separate

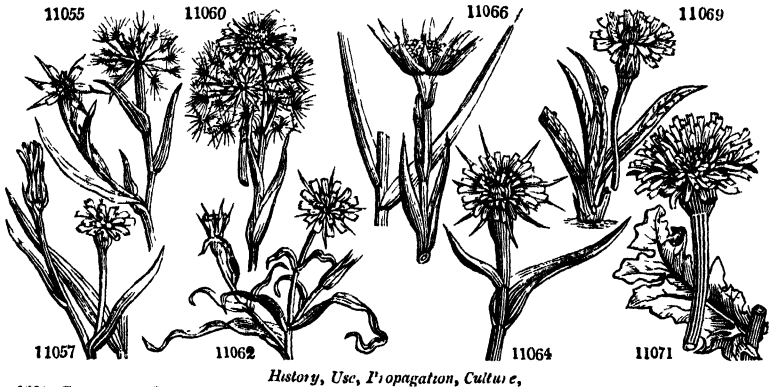
Order 5  SEGREGATA

Each floret having its own peculiar involucre

1843. *Elephantopus* Involucre 4-flowered Florets ligulate, hermaphrodite Recept. naked Pappus setaceous.

1844 *Œdera* Involucre many-flowered Tubular florets hermaphrodite, and one or more female and ligulate. Recept. paleaceous Pappus with many paleæ

1845. *Flaveria* Partial involucre 2-5-leaved, 2-5-flowered. Common involucre imbricated with unequal scales. Florets tubular, 1 often ligulate. Pappus O Recept naked



1846. *Stabe.* Involucre 1-flowered. Floret tubular, hermaphrodite. Recept naked. Pappus feathery.

1847 *Nauenbergia.* Partial involucre 2-leaved, 1-flowered, common involucre leafy. Pappus O. Receptacle setose

1848. *Cassinia* Invol. 2-flowered, 4-leaved Florets hermaphrodite. Pappus paleaceous, pencilled Recept. naked
1849. *Sphæranthus* Invol. 8-flowered. Florets tubular, hermaphrodite, and obsoletely female. Recept. scaly Pappus O
1850. *Echinops* Invol 1-flowered Florets tubular, hermaphrodite. Recept setose Pappus obsolete
1851. *Rolandra* Florets fascicled in a head, with scales between. Invol. 2-valved, 1-flowered. Florets hermaphrodite Pappus O

History, Use, Propagation, Culture,

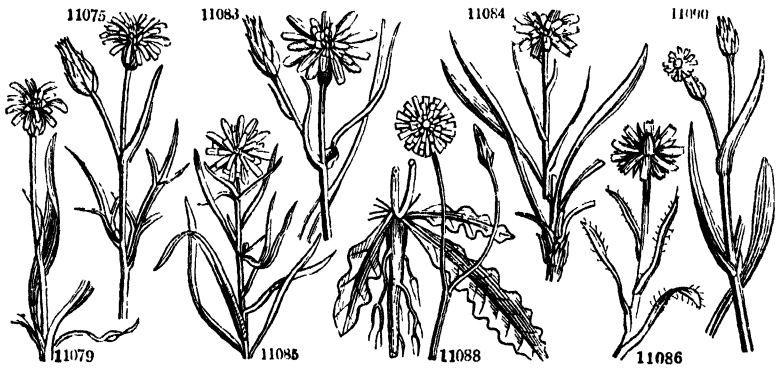
1620 *Geropogon* So named from γερων, an old man, and πωγων, a beard, in allusion to the long silky beard of the seeds

1621 *Tragopogon* From τραγος, a goat, and πωγων, a beard, a name applied in the same way as Geropogon T porrifolius, or Salsafy, has a long tapering fleshy white root, which is used like carrots or parsneps, and cultivated in gardens for that purpose The flavor of the root is mild and sweetish, dressed like asparagus, there is some resemblance in taste It is occasionally grown in British gardens, and a good deal in those of France and Germany It is raised and treated in all respects similarly to the carrot. T pratensis answers equally well for culture as this species, and was formerly preferred to it

1852. *Brotera.* Partial involucre 1-flowered, many-leaved, common 6-8-flowered, imbricated, many-leaved. Florets tubular, uniform Receptacle naked Pericarp covered by the adhering involucre.
1853 *Gundelia* Involucre O Hollows of the receptacle 5-flowered. Florets tubular, male and hermaphrodite. Receptacle paleaceous. Pappus O
1854. *Euxenia.* Involucre 1-leaved, 10-cleft, reflexed, two of the segments larger than the rest. Anthers distinct. Pappus none. Receptacle chaffy.

ÆQUALIS.

11055 Leaves smooth
11056 Leaves hairy
11057 Involucrum with scales at the base

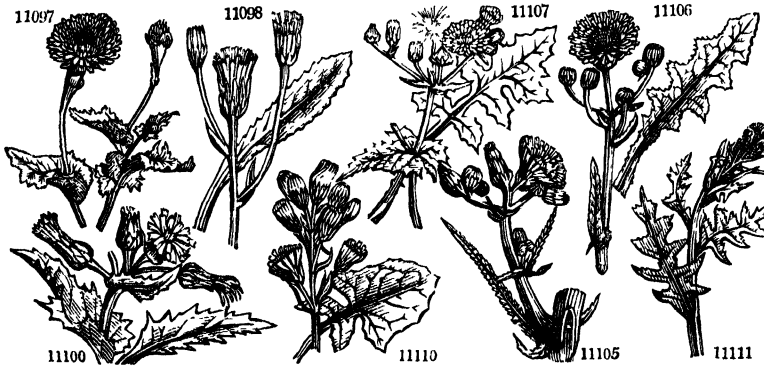


11058 Involucre 8-leaved as long as ray, and peduncles downy, Leaves linear straight
11059 Involucre 8-leaved longer than rays of corolla, Leaves entire straight smooth
11060 Involucre about as long as the corolla Leaves undivided glabrous acuminated channelled, Peduncles cylindrical
11061 Involucre 8-leaved as long as rays of corolla Leaves entire straight lanceolate acuminate
11062 Involucre as long as rays of corolla Leaves entire sub-linear, those of the stem very wavy
11063 Involucre shorter than ray of corolla Leaves entire somewhat wavy
11064 Involucre longer than ray of corolla Lvs entire straight, Peduncle thickened upwards, Florets rounded at end
11065 Woolly with down, Involucre shorter than ray of corolla Lvs linear channelled cauline revolute
11066 Involucre much longer than the corolla Leaves undivided straight, Peduncle thickened upwards
11067 Involucre 5-leaved longer than ray of corolla Leaves entire, Radical and peduncles villous at base
11068 Involucre half as long again as ray of corolla Stem and leaves villous

11069 Scape 1-flowered Leaves of involucre imbricated cuspidate, Leaves linear entire glaucous on each side
11070 Smooth glaucous, Stem erect 2-3-headed somewhat naked, Leaves smooth. radical subhyrate

11071 Involucre downy unarmed, Leaves runcinate toothed
11072 Involucre hispid aculeate, Leaves runcinate toothletted cauline dilated at base
11073 Involucre hispid aculeate, Leaves entire cauline oblong attenuated at base

11074 Lower leaves lyrate with oblong mucronate segments upper pinnatifid
11075 Lower leaves pinnatifid. upper linear, Involucre smooth lower scales spreading mucronate
11076 Lower leaves decursively pinnatifid lanceolate. upper linear-lanceolate, Involucre before opening 8 angular



11077 Stem 1-flowered leafy, Leaves linear downy beneath, Root tuberous
11078 Leaves ovate nerved downy entire sessile
11079 Stem somewhat naked about 1-flowered, and scales of involucre woolly, Leaves oblong lanceolate nerved flat
11080 Stem branched, Leaves amplexicaul lanceolate entire subserrulate at base
11081 Stem about 1-headed leafy, Leaves linear lanceolate acuminate smooth nerved flat
11082 Stem about 1-headed leafy ascending, Leaves lanceolate ensiform smooth nerved flat, Ray longer than involucre
11083 Leaves linear subulate channelled triquetrous, Stem branched
11084 Leaves lanceolate linear flat cauline keeled linear, Stem 1-flowered
11085 Leaves linear ensiform acuminate rigid nerved keeled, Involucre villous leafy at base, Stem somewhat branched
11086 Leaves subulate entire, Peduncle thickened, Stem villous at base
11087 Leaves linear acuminate keeled woolly at base, Stem branched, Involucre woolly, Fruit downy
11088 Leaves runcinate blunt smooth, Scape leafless branched, Peduncles thickened
11089 Stem leafy many-headed, and involucre downy, Lower leaves lanceolate acuminate entire downy upper linear subulate
11090 Stem branched leafy at base, Leaves lanceolate ensiform smooth nerved flat, Ray shorter than calyx
11091 Stem 1-headed leafy at base, Leaves linear lanceolate wavy silky with down all over
11092 Stem leafy many-flowered erect, Leaves nerved filiform acuminate, Involucre and seeds woolly
11093 Leaves linear and 1-flowered, Stem hairy

and Miscellaneous Particulars

1622. *Troximon.* So named by Gærtner, from τρωξιμος, eatable: but, as Sir James Smith observes, without much propriety
1623. *Arnopogon* So named from αρης αρνος, a lamb, and πωγων, a beard · see Geropogon This is the same genus as has been called by Scopoli and Willdenow, Urospermum
1624 *Podospermum* From πους ποδος, a foot, and σπερμα, seed, on account of the long stalk of the fruit. Small herbaceous plants with the flowers of Scorzonera
1625 *Scorzonera* From *scurzon*, the Catalonian name of the viper The plants are esteemed in Spain as a certain remedy for the bite of a viper, but it is believed that the slender tortuous form of the roots has

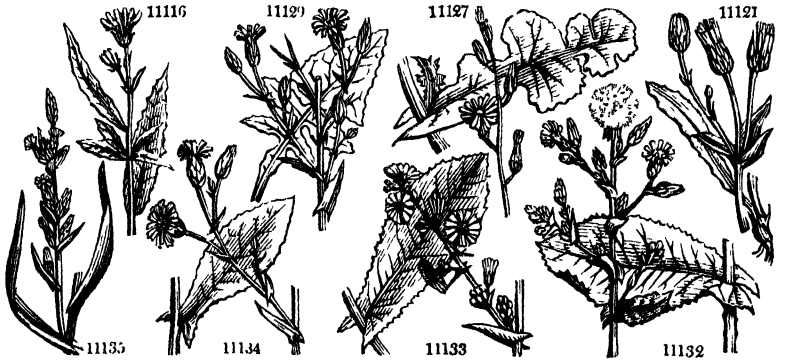
History, Use, Propagation, Culture,

given rise to this belief, rather than any quality inherent in the plant · for it is a rule to which there are few exceptions, that all plants used as food by man, possess very inactive qualities If their action was powerful, they would be unfit for food

Scorzonera hispanica is esteemed diuretic, stimulant, and sudorific A drink is made from it for variola, and a distilled water is also prepared from it It is also an esculent of occasional culture The root is carrot-shaped, about the thickness of one's finger, tapering gradually to a fine point, and thus bearing some resemblance to the body of a viper The outer rind being scraped off, the root is steeped in water, in order to abstract a part of its bitter flavor It is then boiled or stewed in the manner of carrots or parsneps The roots are fit for use in August, and continue good till the following spring Its culture is the same as that of carrot or salsafy

1626 *Picridium* A diminutive of *Picris*, which see Picridium sativum, *Picridium cultivé*, Fr, is sown in the spring as a small salad, and, if not allowed to become too old before it is cut, is an excellent vegetable, with a pleasant delicate flavor, wholly devoid of the bitterness of endive, and of the insipidity of very young lettuces P. tingitanum is a favorite border annual.

1627. *Sonchus.* Σονχος, in Greek, said to be altered from σομφος, hollow, or soft, in allusion to the soft feeble stem of the plants Sonchus oleraceus, *Sow-thistle*, Eng, *Havenkohl*, Ger, seems to have nearly the same properties as the Dandelion and Succory, but it is little regarded as a medicine It is a favorite food with hares and rabbits, and is said to be eaten by goats, sheep and swine, but not to be relished by horses The young tender leaves are in some countries boiled and eaten as greens and it is even affirmed, that the tender



11094 Lower leaves linear · upper pinnatifid, Lobes remote linear
11095 Leaves runcinate hispid, Stem about 2-fi somewhat leafy hispid

11096 Cauline leaves amplexicaul obl nearly entire radical sublyrate runcinate, Scales of involucre appressed

11097 Leaves amplexicaul obl pinnatifid toothed, Involucre squarrose
11098 Leaves scabrous, Scales of involucre membranous at edge ciliated

11099 Peduncle subsol term. naked, Leaves lanc amplexicaul undivided finely toothed backwards
11100 Peduncle branched somewhat scaly, Leaves lanc runcinate, Stem shrubby
11101 Peduncle naked, Involucre smooth, Leaves pinn Pinnæ lin -lanc somewhat toothed
11102 Peduncle naked, Involucre turbin smooth lower scales reflexed at end, Leaves pinnatifid
11103 Peduncle naked, Involucre turbin smooth low scales reflexed at end, Lvs lyrate pinnatif Corymb divaricating
11104 Peduncle naked and involucre smooth, Stem nearly naked, Radic lvs lyrate smooth on each side, Lobes triang
11105 Peduncle and involucre hispid somewhat umbelled, Leaves runcinate sagittate at base [ovate
11106 Peduncles and involucre hispid sub-umbellate, Leaves runcinate dentato-ciliate cordate at the base
11107 Peduncles sub-tomentose umbellate, Involucre glabrous, Lvs runcinate dentato-ciliate amplexic. at base
11108 Peduncle downy umbell Involucre hairy, Leaves bipinnatifid cordate sagittate at base
11109 Peduncle naked, Flowers panicled, Leaves runcinate
11110 Peduncles and involucre hispid racemose, Leaves sublyrate, Terminal lobe deltoid very large
11111 Peduncle squarrose, Fl racemose, Leaves runcinate acuminate smooth glaucous beneath
11112 Peduncle sub-squarrose, Fl. panicled, Leaves lyrate-runcinate toothletted stalked
11113 Leaves sessile lower cordate toothed, upper hispid entire, Peduncles scaly
11114 Peduncle sub-squarrose, Fl panicled, Radic leaves sub-runcinate cauline ovate acuminate stalked
11115 Raceme comp terminal, Leaves lanc ensiform amplexicaul toothed
11116 Peduncle squarrose, Fl corymb Leaves lanc sessile lower runcinate toothed, upper entire
11117 Peduncle naked, Fl in corymbose panicles, Leaves lanc runcinate narrowed at base
11118 Leaves pinnatifid with little white spiny teeth, Calyx slender
11119 Peduncle and involucre smooth a little downy, Leaves sub runcinate spiny-toothed amplexicaul
11120 Peduncle somewhat downy umbellate, Involucre smooth, Leaves pinnatifid toothed auricled cordate at base
11121 Radic leaves unequally pinnatifid cauline linear lanc toothed, Peduncle long 1-flowered
11122 Peduncles hirsute naked, Fl panicled, Leaves lyrate cordate at base hairy beneath
11123 Peduncle scaly, Fl racemose, Leaves runcinate acuminate, Stem panicled virgate

11124 Leaves rounded cauline cordate, Stem corymbose
11125 Leaves sinuate-crenate toothed wavy curled radical with a hairy keel, Florets 5-parted
11126 Lower leaves tripartite pinnatifid with obl blunt segm upper cordate
11127 Leaves runcinate tooth-ciliated blunt amplexicaul sagittate radical obovate, Stem panicled
11128 Leaves smooth beneath lower runcinate toothletted at base dilated and sagittate, upper lanc sagittate
11129 Leaves smooth beneath radical runcinate lyrate toothed, upper runcinate pinnatifid
11130 Leaves smooth beneath lower runcinate entire amplexicaul upper lanceolate sessile
11131 Leaves vertical prickly at keel acute at end sagittate at base runcinate pinnatifid
11132 Leaves oblong toothed horizontal, their keel prickly, their apex obtuse
11133 Leaves smooth beneath obl lanc ciliate-toothed sagittate at base
11134 Leaves smooth beneath lower oblong narrowed at base toothletted, upper lanceolate entire
11135 Leaves with a prickly keel radical lanc pinnatifid, cauline linear entire sagittate
11136 Leaves lanceolate ensiform sessile unequally toothed
11137 Leaves toothletted smooth lower sinuated, upper lanceolate sagittate acuminate, Pan much branched

and Miscellaneous Particulars

shoots of the smooth variety, boiled in the manner of spinach, are superior to any greens not in common use

Nearly the same thing may be affirmed of S arvensis, palustris, and other species

Sonchus floridanus is used as a cure for the bite of the rattle-snake, in the same way as Prenanthes serpentaria It is called by the American settlers *Gall of the Earth*

S tenerrimus is eaten by the common people in Italy as a salad

1628 *Lactuca* From *lac*, milk, on account of the milky sap, which flows copiously when the plants are cut Besides Lactuca sativa, the French cultivate as small salad both L quercina, palmata, and intybacea, which are all excellently adapted for such a purpose. L sativa is well known as furnishing among its numerous varieties the best vegetable of the salad kind grown in the open garden Whoever has the command of lettuce, onions, and cucumbers, may well dispense with most other acetarious plants It is questioned by some, whether the greater number of what are set down as species in this genus, are any thing more than variations of one type, and, at all events, it is thought L virosa, a poisonous plant, is the parent of our cultivated sorts, which would not be more remarkable than the fact that the indigenous celery is one of our strongest poisons

All the species of Lactuca abound in a milky juice, which is found to partake, in a considerable degree, of the qualities of opium The production of this juice is lessened by culture, and especially by blanching It is most abundant in plants in a wild state, and in both wild and cultivated lettuce during inflorescence. Of late years, this juice has been collected by incisions and scraping off the thickened juice, as in the collecting the opium of the poppy (See p 461), and an opium has been produced little inferior to that of the East. It is called

History, Use, Propagation, Culture

Lactucarium, and was first brought into notice by Dr Duncan of Edinburgh, who finds it can be administered with effect in cases where poppy opium is inadmissible Details of the process of collecting and preparing the article, will be found in the Caledonian Horticultural Memoirs. (Vol i 160-259 h. 314, and iv. 153)

The culture of lettuce as a salad plant is familiar to every one who has a garden It is sown monthly, or oftener, throughout the year, in order to have a successional supply, and thinned out or transplanted to increase the size and succulency. The latter quality is greatly increased by watering in summer; and blanching, another desirable property, is promoted by tying up the leaves when the plant has attained about two-thirds of its usual size Snails and slugs are very fond of this plant, and should either be watched and hand-picked, or the ground well watered with lime water, which effectually destroys them The lettuce, unlike the cabbage and spinage, is a vegetable which can be grown to as great perfection in a warm as in a temperate climate, provided it be grown on rich soil, and abundantly supplied with water Hence the lettuces of Paris, Rome, and Calcutta, are as large and tender as those of London and Amsterdam.

This genus is the type of the tribe *Lactuceæ* of M Cassini. It differs essentially from all other tribes of Compositæ, in having a divided or ligulate corolla only, and from nearly all other tribes in its style, which can be compared to that of Vernonieæ only The radiant head of flowers is a character common both to Lactuceæ and Nassauvieæ The greater part of Lactuceæ are found in Europe, a smaller number in Asia and Africa, very few in America, and in the southern hemisphere none at all.

1629 *Chondrilla.* Derived from χονδρος, a lump Dioscorides says, it bears on its stems little lumps of gummy matter But Theophrastus speaks of the grumous or tubercled roots of his Chondrilla. The plant now so called is an inconspicuous perennial plant, of no recorded use.

1630. *Prenanthes.* From πρηνης, drooping, and ανθος, a flower. The heads of flowers of all the species are

11138 Leaves decurrent: lower pinnatifid toothed outwards, upper linear, Stem branched
11139 Lower leaves lanc. runcinate toothed narrowed at base and sessile upper linear sagittate
11140 Leaves runcinate pinnatifid unequally toothed: floral lanceolate, Flowers racemose
11141 Radic leaves pinnatif. toothed · cauline linear entire sagittate, Branches 1-flowered
11142 Leaves all pinnatifid: segments linear toothed upwards. Fl in corymbose panicles

11143 Radic. leaves runcinate: cauline linear entire
11144 Radic. leaves runcinate: cauline undivided filiform, Stem and involucre smooth

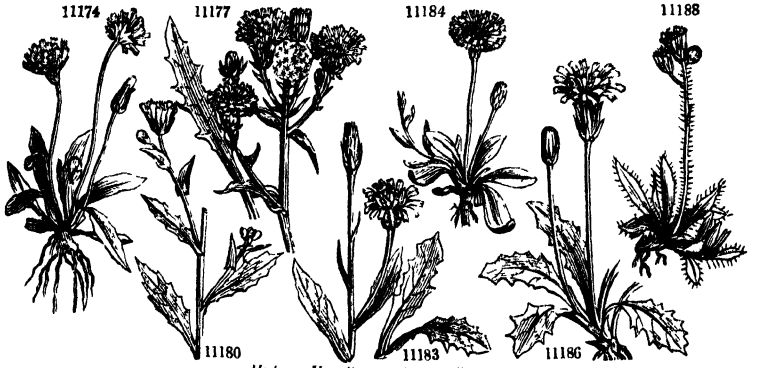
11145 Involucre 5-fl Leaves obl lanc. amplexicaul cordate denticulate glaucous beneath
11146 Involucre many-fl. Leaves angular hastate toothed, Flowers nodding racemose panicled
11147 Involucre 5-fl Leaves 3-lobed stalked angular toothletted rough at edge, Racemes axillary, Fl nodding
11148 Stem panicled upwards, Leaves stalked cordate toothed ciliated, Panicle lax racemose
11149 Leaves linear tooth-sinuated sessile, Stem shrubby much branched, Branches spiny
11150 Florets 5, Leaves lyrate-pinnatifid and toothed, the terminal lobe with about 5 angles
11151 Leaves pinnated, Leafl linear filiform, Panicle corymbose stalked, Stem shrubby
11152 Leaves pinnatifid pinnate with linear segments
11153 Leaves pubesc. toothed, those on the stem subsaggitate, Stem panicled corymb. Involucre pyramidal glabrous

11154 Outer scales of the involucre reflexed, Leaves runcinate glabrous toothed
11155 Outer involucre spreading, Leaves runcinate scabrous, Segments round toothletted
11156 Outer scales of the involucre erect appressed, Leaves sinuato-dentate nearly glabrous

11157 Outer involucre spreading, Scales ovate, Scape 1-fl Leaves obov. bluntish toothed
11158 Outer involucre spreading, Scales ovate-lanceol Lvs runcinate pinnatifid glabrous with lin falc distant lobes
11159 Leaves pinnatifid to the nerve smooth, Leaves of involucre smooth reflexed

11160 Scape 1-fl naked thickened and hairy upwards, Involucre hispid, Leaves lanc obl somewhat toothed
11161 Scape 1-fl squarrose thickened and somewhat hairy upwards, Involucre hispid, Leaves lanc obl smoothish
11162 Scape 1-fl naked and involucre smooth, Leaves lanc runcinate-toothed smooth
11163 Scape 1-fl nearly naked upward and involucre hairy, Leaves lanc. toothed at base with a few forked hairs
11164 Scape 1-fl naked smooth Scales of involucre acute hairy, Lvs obov runcin hairy scabrous, Root tuberous
11165 Scape 1-fl nearly naked and calyx pubesc Lvs lanceol acute somewhat toothed hoary, Hairs multifid
11166 Scape single-flowered thickened upwards, Leaves glab runcinato-dentate, Involucre very hairy
11167 Scape branched scaly upwards, Lvs lanc toothed or pinnatif sub-glab. Peduncle swelling beneath involucre
11168 Scape naked 1-fl and involucre hairy, Lvs runcinate pinnatifid hairy, Segm recurved tooth Hairs 3-forked
11169 Scape single-flowered, Leaves dentate scabrous, Florets hairy at their orifice glandular at the tip
11170 Stem leafy somewhat branched hairy, Involucre smooth, Leaves lanc runcinate hairy, Hairs forked
11171 Scape 1-fl scaly thickened upwards and hairy, Involucre hispid, Leaves runcinate smooth
11172 Scape naked 1-fl. glabrous, Involucre hairy, Leaves runcinate toothed scab somewhat hairy Hairs prostrate
11173 Scape naked 1-fl and involucre smoothish, Leaves pinnatifid-toothed hispid, Hairs simple subulate

and Miscellaneous Particulars



nodding Prenanthes serpentaria grows to the height of two feet, bearing pale purple flowers. It is known by the inhabitants of Virginia and Carolina under the name of the Lion's Foot, and is in high esteem as a cure for the bite of the rattle-snake The juice of the plant boiled in milk is taken inwardly, and steeped leaves, frequently changed, are applied to the wound. It must not be confounded with Prenanthes rubicunda, called False Lion's Foot, which is a less powerful plant

Prenanthes virgata has a very fine effect in large plantations

1631 *Leontodon.* So named from λεων, a lion, and οδους, a tooth; in reference to the deep tooth-like divisions of the leaves. The English name *Dandelion*, is a corruption of the French translation of this word, *Dent de lion*, in German *Pfaffenröhrlein* and *Dotterblume* It has been recommended as a winter salad, blanched like Endive, but it possesses too much bitter principle to render it fit for table under any management *Dent de lion*, Fr, from its cut leaves, and *Pess-en-lit*, in French, and most other European languages, from its diuretic qualities. The tender leaves in spring, used in compound salads, are equal to those of Endive or Succory. The roots, which are fusiform, and abound in a milky juice, are eaten raw as a salad by the French, and boiled by the Germans, like Salsafy and Scorzonera Dried and ground into powder, they afford a substitute for coffee, in all respects equal to that of Chicory roots. It is a difficult weed to extirpate, because every inch of root will form buds and fibres, and thus constitute a new plant Swine are fond of it, and goats will eat it, but sheep and cows dislike it, and by horses it is refused.

1632 *Apargia.* Απαργια is the Greek name of a plant now unknown. It has been employed by Dalechamp and Scopoli for a species of Hieracium. At the present day it is given to a genus of weedy plants, with the appearance of Leontodon.

History, Use, Propagation, Culture,

1633 *Thrincia* From θρινξ, a feather, in allusion to the feathery pappus of the seeds. Small uninteresting weeds of no value or beauty

1634 *Picris.* From πικρος, bitter, a name given by the Greeks to some plant resembling Lettuce, on account of its bitterness None of the species are remarkable for their qualities

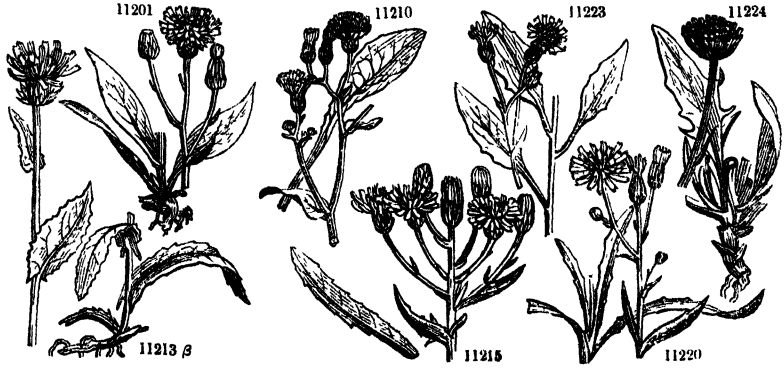
11174 Scape single-fl. Leaves dentate scab. Involucre nearly glab. Outer pericarps with a scaly pappus
11175 Scape 1-fl pilose, Invol hoary naked, Leaves lanc. blunt toothed, Hairs forked
11176 Scape 1-fl hispid, Leaves obl. runcinate toothed hispid, Hairs forked

11177 Stem erect scabrous, Leaves amplexicaul. lanc. toothed, Fl. corymbose, Outer invol. lax
11178 Stem ascending scabrous, Leaves obl lanc blunt sinuate pinnatifid, Pedunc. thickened
11179 Leaves obl lanc nearly entire sessile, and invol hispid, Hairs glochidate
11180 Stem branched spreading leafy, Leaves amplexicaul. obl repand hispid

§ 1 *Scape one-flowered, naked.*

11181 Scape 1-leaved, Invol. hairy, Leaves lanc runcinate toothed subpubescent, Teeth recurved
11182 Scape somewhat naked villous, Invol very villous, Leaves lanc. entire acute villous
11183 Scape 1-leaved downy upwards, Invol cylindr downy, Leaves lanc toothletted
11184 Leaves entire ovate downy beneath, Stolones creeping
11185 Scape naked thickened upwards hairy, Invol smooth, Leaves lanc obl. somewhat toothed smooth
11186 Scape nearly naked, Invol. hispid, Leaves lanc spatulate runcinate-toothed smoothish

§ 2 *Scape many-flowered, naked*



11187 Scape about 4-fl naked, Leaves obl blunt entire, Stolones creeping
11188 Scape 1-leaved with about 6 fl Fl umb Leaves lanc acute entire, Stolones creeping
11189 Scape leafy pilose at base, Fl corymbose, Peduncles downy, Leaves lanc acute nearly entire pilose
11190 Scape leafy smoothish, Fl. in corymbose panicles, Pedunc spreading, Invol hairy
11191 Scape leafy hispid, Fl in corymbose panicles, Pedunc clustered, Invol hispid
11192 Scape about 3-fl 1-leaved hairy, Leaves lin lanc acute pilose
11193 Scape somewhat naked branched about 3-fl Pedunc. squarrose, Leaves lin lanc toothletted smooth
11194 Scape about 2-fl Peduncles long, Leaves spatulate lanc entire pilose, Stolones creeping
11195 Scape forked about 2-fl and leafy at base, Leaves lanc acute entire, Stolones O
11196 Resembles H murorum, but the stem is naked
11197 Scape naked corymbose, Leaves lyrate runcinate hairy
11198 Leaves ovate somewhat toothed, Scape naked racemose, Upper flowers opening first
11199 Scape naked scabrous at base, Fl in racemose corymbs, Leaves oblong blunt toothletted hairy
11200 Scape leafy hispid, Fl corymbose, Pedunc clustered, Leaves obl acutish pilose-hispid
11201 Scape somewhat naked branched, Invol with glandular hairs, Leaves oblong acute entire woolly
11202 Scape naked branched, Invol smooth, Leaves obovate acute entire ciliated, Veins colored
11203 Scape leafy in corymbose panicles, Invol. pubescent, Radic. leaves entire obovate blunt ciliated

§ 3 *Stem leafy*

A *Leaves entire*

11204 Stem erect, Leaves alternate lanc naked toothed, Panicle capillary
11205 Stem erect branched, Leaves lanc sessile somewhat toothed glaucous narrowed at each end
11206 Stem erect branched, Leaves lin lanc nearly entire narrowed at each end ciliated at base
11207 Stem erect simple, Leaves lanc cordate amplexicaul toothletted downy, Fl racemose corymbose
11208 Stem erect few-fl Caulme leaves lanc acum runcinate radical obl lanc undivided
11209 Stem erect pilose panicled, Leaves ovate oblong subcordate sessile remotely toothed entire at end
11210 Stem erect hairy, Fl subcorymbose, Caulme leaves oblong lanceolate stem-clasping radical toothed
11211 Stem erect villous, Lvs pilose somewhat toothed radic obov, caul obl half-amplexicaul, Inv hirsute
11212 Stem erect branched, Lvs ovate cord amplexicaul toothed towards the base, Pedunc and invol hirsute
11213 Stem erect simple furrowed smoothish, Rad lvs obl deeply toothed at base, caul. hastate sagit. Inv lax

11214 Stem erect panicled furrowed downy, Leaves rugose upper lanceol Invol lax hispid
11215 Stem ascending simple furrowed viscid, Leaves lanc with recurved teeth, Involucre hispid
11216 Stem erect branched hispid, Leaves lanc toothed sessile narrowed at each end, Invol lax hispid
11217 Stem erect about 2-fl Leaves pilose toothed radical oblong, caulme lanc sessile, Invol. villous
11218 Stem cymose fistulous many-leaved, Leaves ovate-lanceolate toothed forwards
11219 Stem cymose solid few-leaved, Leaves lanceolate broadly toothed forwards
11220 Stem erect branched leafy, Leaves linear entire
11221 Stem erect simple leafy 1-fl Leaves ovate-lanc toothletted sessile
11222 Radic. leaves oblong and lanceolate bluntish narrowed at base toothletted woolly, Invol hoary
11223 Stem leafy erect simple, Leaves oblong villous somewhat toothed, Fl panicled
11224 Stem erect somewhat branched and lvs villous: radic obl lanc toothed, caul ovate cord amplexicaul
11225 Differs from H villosum in having the involucrum covered with dense short brown hairs
11226 Radical lvs lanc narrowed into stalk caul. sub-amplexic toothed backwards acute smooth, Inv villous
11227 Stem erect smooth below, Leaves sub-villous lanc acute radical toothletted, Invol villous

and Miscellaneous Particulars

1635 *Hieracium.* It was believed formerly, that birds of prey made use of the juice of this kind of plant to strengthen their vision, whence it was called *Hieracium*, from ἱέραξ, a hawk; the French word *Epervière*, the English *Hawk-weed*, and the German *Habichtskraut*, all bear witness to the universal belief in this very strange opinion. An extensive genus of plants, many of which, especially H aurantiacum, are objects

History, Use, Propagation, Culture,

deserving cultivation, others are of little interest, but all most difficult to distinguish or characterize The species appear to intermix with the same facility as roses and willows.

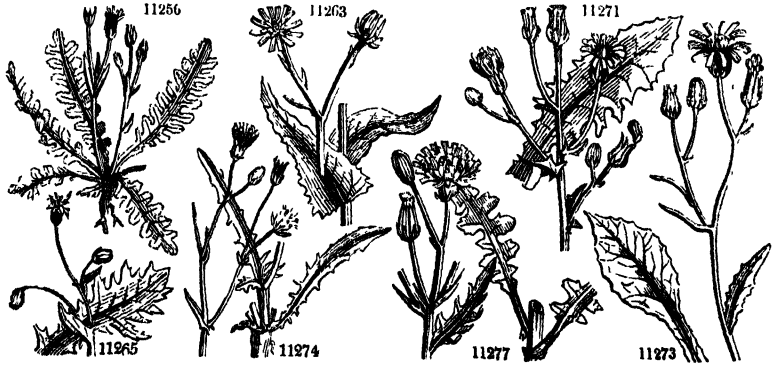
Hieracium venosum, a very pretty plant, is called in America, *Poor Robin's Plantain*, and is believed to possess considerable medical powers.

1636. *Lagoseris.* From λαγος, a hare, and σερις, a lettuce. Obscure weed-like plants.

11228 Near H. villosum, but the leaves are broader
11229 Stem erect many-fl Leaves lanc toothed, Peduncles downy
11230 Stem at base and lvs. here and there covered with hairs, Fls. smaller and inv less vill than in H. villosum
11231 Stem erect many-fl. Leaves sessile ellipt lanc. toothletted smoothish glaucous beneath
11232 Radic. lvs. obl. narrowed at base acute caul. sub-amplexic. lanc. Pedunc glandular, Inv glandul. hairy
11233 Stem erect strigose hispid, Leaves lanceolate nearly entire strigose hispid, Flowers corymbose
11234 Stem pilose warted glandular upwards, Leaves sub-amplexicaul. oblong acute with long hairs beneath
11235 Stem erect branched hoary, Leaves obov. obl. hoary toothed towards the base, Hairs feathery
11236 Stem erect many-fl Leaves amplexicaul. somewhat rough toothed at edge, Pedunc downy

11237 Stem densely leafy, Leaves amplexicaul. 3 inches long 1¼ inch wide toothed hairy
11238 Stem erect simple, Leaves ovate cordate amplexicaul. toothletted ciliated, Fl. panicled, Involucre smooth
11239 Stem erect simple, Lvs ovate-obl smoothish acute sess sub-amplexic. toothed towards base, Fls. corymbose
11240 Stem erect branched, Leaves obl lanc smooth stalked deeply toothed in the middle, Fl. panicled
11241 Leaves narrowed at base sessile with long points toothed, Involucre downy hoary
11242 Stem erect simple, Leaves linear somewhat toothed, Fl in corymbose umbels
11243 Leaves broader than in the last and less toothed, Stem few-flowered
11244 Leaves mostly radical with long points toothletted hairy, Involucre hoary with long white and black hairs
11245 Stem branched shrubby, Leaves oblong toothed stalked, Peduncles sub-corymbose, Involucre downy

B *Leaves sublyrate, lyrate, pinnatifid*



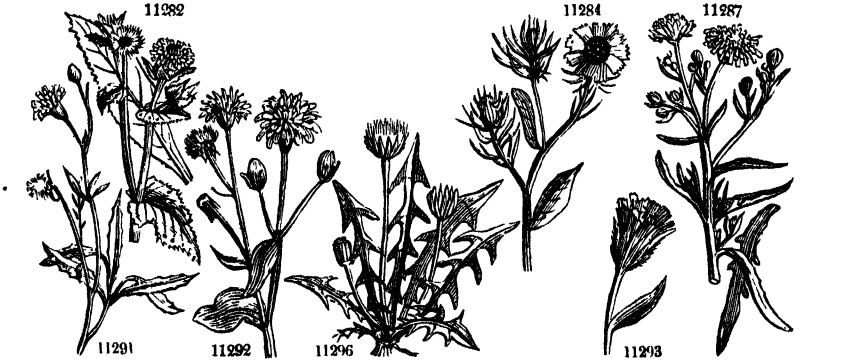
11246 Stem erect few-fl Peduncles and involucre pilose, Leaves oblong sub-pinnatifid at base
11247 Stem naked few-fl Pedunc. and involucre glandular downy blackish, Leaves oblong stalked toothed at base
11248 Stem procumbent branch at base few-fl. Ped and involucre downy, Lvs. ovate unequal at base toothletted stalked
11249 Stem erect leafy pilose simple, Fl panicled, Leaves ovate deeply toothed at base
11250 Stem simple, Leaves smooth obl narrowed at base runcinate toothed caul amplexicaul Involucre hispid
11251 Stem simple, Cauline leaves lyrate runcinate amplexicaul hairy, Fl panicled, Involucre hispid
11252 Stem erect panicled, Leaves ovate stalked deeply toothed at base, Flowers panicled
11253 Stem simple, Leaves smooth radical runcinate lyrate, cauline lanceolate, Involucre and pedunc hispid
11254 Leaves lanc runcinate roughish, Flowers in umbels
11255 Stem erect leafy simple smooth, Leaves sessile obl. acute finely toothed, Pedicels of panic. in bundles

11256 Leaves pinnatifid crenate, Scape naked few-flowered

11257 Leaves long lanceolate acute repand smooth, Fl cylindrical, Outer involucre very small
11258 Leaves runcin toothed smooth, Scape naked many-fl ascending, Involucre downy outer scales appressed
11259 Radic leaves and lower cauline pinnated lyrate, Flowers corymbose, Involucre and pedunc glandular
11260 Leaves scabrous radic lyrate runcinate, cauline lanc amplexicaul toothed at base, Involucre downy
11261 Lower lvs runcin pinnatifid. upper entire, Branches naked, Involucre downy with leaflets bristly at the back

11262 Leaves runcin pinnatifid pilose scabrous, Stem panicled, Leaves of involucre keeled channelled downy
11263 Leaves ovate cordate-sagittate amplexic toothed, Peduncles long 1-fl Involucre hispid outer membranous
11264 Radic leaves runcinate-lyrate cauline amplexicaul lanceol, lower pinnatifid, Involucre hispid
11265 Leaves runcinate pinnatifid scabrous sessile upper lanceol deeply cut at base, Involucre ovate angular
11266 Leaves amplexicaul pinnatifid hairy, Leaves of involucre downy hoary flat
11267 Leaves amplexicaul lower obl toothed, upper cut-toothed, Stem setose hispid, Involucre muricated in fruit
11268 Setose hispid, Leaves runcinate auricled at base upper lanc sagitt hastate, Involucre very hispid

11269 Leaves runcin lyrate bluntly toothed, Scape naked many-fl hispid, Lvs of involucre membranous at edge
11270 Hispid-scabrous, Leaves oblong amplexicaul remotely toothed, Stem divaricating branched
11271 Leaves rigid scabrous toothed radic obovate, caul sagittate amplexicaul Fl in racemose panicles
11272 Leaves hispid ovate obl finely and deeply biserrate, Scape naked corymbose
11273 Leaves smooth toothed. radical ovate-spatulate, cauline oblong sessile, Corymb terminal
11274 Lvs glab runcin · the upper ones linear-sagitt amplexic Stem glab. Panic subcorymb Involucre pubescent
11275 Leaves lanc · lower entire toothed smooth, cauline lanceolate amplexic Stem furrowed branched
11276 Radic leaves lanc runcinate cauline lanc toothed at base sagittate, Panicles corymbose
11277 Leaves hispid runcinate pinnatifid upper sessile lanc. toothed prickly upon the keel
11278 Leaves smooth lower remotely toothed, upper nearly entire subsagittate, Involucre downy
11279 Radic leaves lyrate runcinate cauline hastate lanceolate, Branches divaricating, Involucre downy
11280 Leaves pinnatifid segments linear, radical toothed, cauline entire, Stem panicled, Involucre downy
11281 Leaves linear-filiform entire smooth, Pappus sessile



and Miscellaneous Particulars.

1637. *Borkhausia.* Named after Moritz Borkhausen, a German botanist, author of some useful works, especially upon the useful plants of Germany, published in one volume octavo, in 1790. Small annual plants, formerly referred to Crepis.

1638. *Crepis.* A name made use of by Pliny, to designate a plant of which he gives no description The plants of this genus are common weeds of the hedges of Europe

History, Use, Propagatum, Culture,

1639 *Helminthia* An abridgment of *Helminthotheca*, a name employed for this genus by Vaillant. It is derived from ἑλμινς, a worm, and θηκη, a case. in allusion to the corrugated seeds, which may be fancied to resemble bundles of little worms The genus was united by Linnæus with Picris, but has been again separated by modern botanists.

1640 *Myoseris* So named from μυς μυος, a mouse, and σερις, lettuce, a name invented for the purpose of maintaining a resemblance in nomenclature with Hyoseris, Lagoseris, and other similar plants.

1641. *Tolpis* A name invented by Adanson, ahd supposed to have no meaning. Handsome annual flowers.

1642. *Andryala* A name, the meaning of which has not been discovered Rather pretty plants, natives of the south of Europe and north of Africa.

1643 *Rothia* Named by Schreber, in honor of Dr. A. G. Roth, author of a Flora Germanica, in 1788, Catalecta Botanica, in 1797, and other works It has been united with Andryala by Richard

1644. *Krigia* Named after Dr Krieg, a German botanist, who accompanied Mr. Vernon to America in search of plants See Vernonia A pretty little North American plant, with grassy leaves and bright yellow neat flowers

11282 Involucrum large prickly, Leaves repand

11283 Leaves runcinate pinnatifid · lobes oblong acute toothed spreading, Scape naked many-fl smooth

11284 Leaves obl toothed, Pedunc. 1-flowered
11285 Leaves lanc oblong lower sinuate-toothed, Pedunc proliferous
11286 Leaves obl linear scabrous toothed, Stem branched divaricating, Lower scales of involucre downy

11287 Leaves gland downy lower runcinate toothed, upper ovate lanc. entire, Stem and pedunc. glandular
11288 Leaves downy pinnatifid, Involucre downy pilose, Hairs rigid
11289 Leaves pinnated linear downy
11290 Leaves pinnatifid lyrate, Flowers corymbose aggregate, Pedunc and involucre hispid
11291 Leaves downy oblong lower toothed, Stem branched, Branches 1-flowered
11292 Leaves ovate woolly lower somewhat toothed, Corymb terminal, Pedunc about 2-flowered

11293 Stem branched at base diffuse, Leaves downy ovate lanceolate amplexicaul nearly entire
11294 Stem erect corymbose, Leaves somewhat downy linear sinuate-toothed sessile upper entire
11295 Stem erect corymbose, Leaves downy sessile lower obl runcinate, Pedunc. gland. villous

11296 The only species

11297 Scapes 1-fl. naked, Leaves smooth lyrate runcinate toothed term lobe trifid
11298 Scapes 1-fl naked, Leaves smooth lyrate runcinate somewhat fleshy segm angular imbricated
11299 Scapes 1-fl. naked thickened at end, Leaves lyrate pinnatifid toothed ciliated roughish
11300 Stem branched leafy diffuse, Leaves amplexicaul oblong toothed scabrous ciliated at edge
11301 Scapes 1-fl hispid, Leaves obl runcinate toothed hispid, Hairs forked

11302 Stem diffuse branched, Leaves obl toothed narrowed at base sessile, Scales of involucre in fruit smooth
11303 Stem diffuse branched, Lvs obl toothed narr at base sess Scales of involucre in fruit hairy
11304 Stem diffuse branched, Lvs obl toothed subcordate amplexicaul Scales of involucre in fruit smooth
11305 Related to the last, but the leaves are deeply toothed with 3-forked hairs
11306 Leaves somewhat toothed, Hairs simple, Pedunc very thick
11307 Stem erect branched, Lvs obl somew toothed subcordate amplex Scales of involucre in fruit alternately setose
11308 Stem erect panicled, Lvs obl hispid deeply toothed, Scales of involucre in fruit smooth muricated at the end

11309 The only species

11310 Smooth, Leaves obovate toothed
11311 Hispid, Leaves obovate somewhat toothed
11312 Stinging, Stem branched, Leaves toothed
11313 Radical leaves spatulate toothed pilose, Stem ascending smooth, Pappus stalked

11314 Hairy with very short stellate hairs and bristles, Lvs lanc entire, Pedunc. term thickened upwards 1-fl

11315 Stem simple leafy 1-fl Leaves lanc toothed
11316 Stem almost leafless solitary, Leaves ovate-oblong undivided toothed (spotted above)

and Miscellaneous Particulars

1645 *Hyoseris* From υς *us*, a hog, and σερις, the Greek name of the Lettuce, or of a plant resembling it. hogs-lettuce, in allusion to the abominably fetid smell of the plant.

1646 *Hedypnois* Under this name, a kind of wild endive, the medicinal qualities of which he much extols, is described by Pliny Dalechamp, his commentator, derives the word from ἡδυς, sweet, and πνεω, to breathe, on account of a pleasant flavor communicated to other vegetables in cookery But the modern genus, which consists of uninteresting weeds, has not been discovered to possess this quality

1647 *Robertia* Named by the authors of the Flore Française, after M Robert, a Corsican botanist. A small weedy plant resembling Dandelion

1648. *Scriola* A diminutive of σερις, chicory. Small chicoraceous weeds of the south of Europe S. Alliatæ is not, as its name would lead one to suspect, named from any smell of garlic which it possesses, but in honor of Prince Joseph Alliata, a Sicilian nobleman, and patron of Bivona Bernardi

1649 *Soldevilla* So named by Lagasca, apparently in honor of some botanist. A little Spanish weed with terminal solitary flowers.

1650. *Hypochæris.* From υπο, for, and χοιρος, a pig; *Porcelle*, Fr, for the same reason, viz., that pigs eat the roots with avidity. All the species are uninteresting weeds.

History, Use, Propagation, Culture,

1651 *Lapsana* From λαπαζω, to purge The Lapsana, says Pliny, gently relaxes the body. L communis is called *nipple-wort*, in English, and *herbe aux mamelles*, Fr, having been formerly applied to the breasts of women to allay the irritation occasioned by nursing

1652. *Zacintha* A plant growing in the island of *Zacintha* or Zante It was formerly included in Lapsana, under the name of L Zacintha

1653 *Rhagadiolus* From ῥαγας, a slit, each division of the calyx being hollowed out in the middle so as to resemble a furrow, or little gutter

1654 *Moscharia* This plant gives out an agreeable smell of *musk* An annual plant, with stem-clasping pinnatifid deeply cut leaves, found in sandy waste places in Chili, where it is commonly called *Almizcelillo.*

1655 *Catananche* Vaillant explains the meaning of this word, by deriving it from the two Greek words, κατα, and αναγκη, necessity that is to say, a plant which compels admiration What is certainly known of its origin is, that it was employed by Dioscorides to designate a plant used by the women of Thessaly, in philtres and love potions The modern genus, which contains two or three species of ornamental border annuals, can have no reference to that of the ancients, one kind of which is believed to have been Ornithopus compressus, and another Astragalus pugniformis. John Bauhin calls Lathyrus Nissolia by the name of Catananche leguminosa

1656. *Triptilion* A genus instituted by the authors of the Flora Peruviana, and named from τρεις, three, and πτιλον, a feather, on account of the three divisions of the pappus The species mentioned above is a very pretty little annual, or rather biennial plant, flowering during all the winter months in any place whence frost is excluded, but it requires not to be kept too dry There is a fine species in Chili, with bright blue flowers, but it has not been yet introduced The inhabitants of South America employ the flowers of the different species as everlasting flowers, for which their dryness renders them very well adapted.

1657. *Cichorium.* In Greek κιχωρη De Theis's remarks are upon this subject excellent. Bodæus, he observes, Lonnæus, and others, have derived this name from κιω, to come, and χωριον, the field, that is to say,

11317 Leaves toothed roughish, Invol. hispid, Pappus of disk stipitate plumose: of the ray sessile setose
11318 Hispid, Calyxes hairy, Stem branched, Lvs. lanc toothed
11319 Nearly glab Invol. obl. imbricated, Stem branched somewhat leafy, Radical leaves dentato-sinuate
11320 Stem branched leafless glab. Pedunc. with small scales, Lvs. runcinate obtuse scab.
11321 Different from the last in having a smooth involucrum

11322 Stemless, Scape 1-fl. Leaves runcinate pinnatifid, Terminal lobe rhomboid

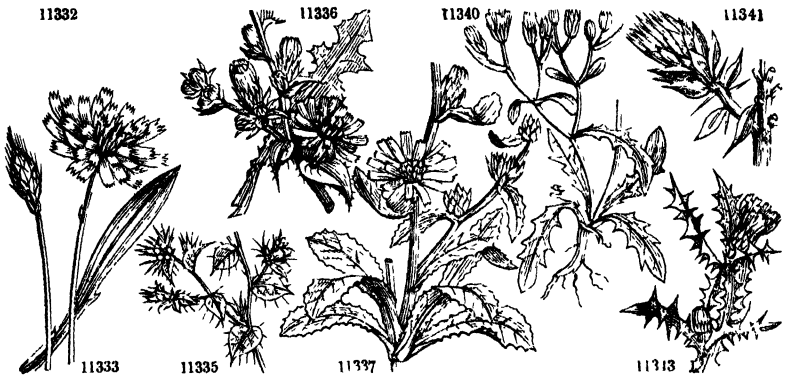
11323 Scape branched very thick and fistulose upwards, Leaves obovate oblong toothed

11324 Invol of the fruit angular, Stem panicled, Pedunc slender, Lvs. ovate petiolate angulato-dentate
11325 Caulescent branched, Leaves ovate stalked doubly toothed
11326 Caulescent branched, Lvs angular-toothed lower lyrate-pinnatifid, Pedunc and invol smooth
11327 Caulescent panicled, Stem downy below, Radical leaves lyrate toothed. upper lanc entire

11328 Rad. leaves lyrate acute, Cauline sagittate amplexicaul. toothed

11329 Fruit smooth spreading, Cauline leaves lanc undivided
11330 Fruit smooth spreading, Leaves lyrate
11331 Fruit prickly spreading, Leaves linear lanc. entire

11332 Leaves amplexicaul pinnatifid · segments deeply jagged



11333 Lower scales of invol ovate mucronate, Leaves villous linear sub-bipinnatifid at base
11334 Lower scales of invol lanc Leaves lanc toothed 3-nerved

11335 Leaves cordate spiny

11336 Flowers sess axill in pairs, Leaves runcinate
11337 Flowers axillary twin sessile, Leaves obovate toothed
11338 Pedunc axill twin · one long 1-fl, the other very short about 4-fl Flowers capitate
11339 Pedunc axill. twin one long 1-fl, the other very short about 2-fl Stem dichotomous, Rad. lvs. runcinate
11340 Flowers axill. solitary, Stem dichotomous, Branches naked spiny, Lvs lanc runcinate toothed

11341 Leaves obovate mucronate cartilaginous, Flowers solitary

11342 Fl solitary lateral sessile, Lvs decurrent, Stem subsimple villous erect
11343 Fl solitary, Lvs roughish smooth, Stem winged toothed
11344 Fl subaggregate, Lvs scabrous with the middle rib below hairy interruptedly decurrent

and Miscellaneous Particulars

it is a plant found wild in fields,—which grows every where but this etymology is overstrained. It is much more natural to suppose that the Egyptians, who used this plant in great quantities, would have communicated to the Greeks, along with the manner of using it, the name by which it was known in Egypt, which appears from Forskahl to be *chikoùryeh* Pliny remarked, that the Egyptians made their chicory of much consequence, and it is very well known that, at the present day, chicory or similar plants constitute half the food of the common people in Egypt In like manner, there can be little doubt that the specific terms Endivia and Intybus, are both derived from the Arabic name *hendibeh*

The leaves of Cichorium Intybus are employed by the French under the name of *Barbe du Capucine*, as a kind of winter salad, for which purpose the leaves are blanched like Endive The most common method of cultivating the plant, is to sow the seed in drills in the end of July, and to keep the plants about six inches apart, and quite free from weeds In the winter the roots are taken out of the ground and packed up in a warm cellar among earth, in layers, like bottles in a wine cellar, the crowns only of the roots being exposed. In a few days, young leaves are produced in great abundance, from the situation in which they are cultivated quite blanched, and, if not grown too rapidly, with an agreeable taste There is also a variety of C Intybus, called *Chichorée à café*, which is cultivated extensively in France for the sake of its roots, which are taken up in the winter season, cut into squares, dried artificially, and afterwards, being roasted, are ground along with their coffee, for which they serve as an adulteration There are those, however, who assert, that it is to this admixture of Succory root that the superior flavor of the French to the English coffee is to be attributed

1658 *Bacazia.* Named by the authors of Flora Peruviana, in honor of George Bacas, professor of botany at Carthagena.

1659. *Scolymus* The Greek name of a spiny plant, which appears to have been the modern artichoke. The word itself is derived from σκολος, a spine S hispanicus has simple tuniform roots, soft and sweet like Scorzonera, and equally good to eat. The leaves and stalk also abound with a milky juice, and the people of Salamanca eat it in the same manner as Cardoons The flowers are used for adulterating saffron

History, Use, Propagation, Culture,

1660 *Arctium* From ἄρκτος, a bear, (*arth*, Celtic); on account of the rough bristly fruit, which may be compared to the coarse hair of a bear Lappa is derived from *llap*, a hand, in Celtic, because it lays hold of every thing near it. The burdock is too familiar to every schoolboy to need illustration It is equally common in Europe and Japan, by road sides and on ditch banks. Few quadrupeds, except the ass, will eat the plant, but birds feed on the seeds, and snails and caterpillars on the leaves The stems, stripped of their rind before the flowers appear, may be eaten, either boiled or raw, with oil and vinegar. Withering says, a decoction of the roots is esteemed by some equal to that of Sarsaparilla. Burnt green, between the time of flowering and seeding, three pounds of the ashes produced sixteen ounces of very white alkaline salt, as good as the best potash.

1661. *Serratula.* A diminutive of *serra*, a saw, the leaves being edged with cutting teeth. Plants with the habit and qualities of thistles Serratula tinctoria dyes cloth of a yellow colour.

1662. *Saussurea.* Named in honor of the celebrated Swiss philosopher Horace Benedict de Saussure, who, among his other acquirements, possessed a considerable knowledge in botany He died in 1799, in the fifty-ninth year of his age.

1663. *Carduus.* This word appears to be derived from *ard*, a point, in Celtic, in allusion to the numerous

11345 Leaves cordate petiolate
11346 Cauline leaves cordate stalked entire, Involucre cobwebbed downy
11347 Involucre woolly, inner scales subulate somewhat colored scarcely longer than outer, Racemes axillary paniculed

11348 Leaves sharply serrate glabrous pinnatifid: the terminal lobe the largest, Flowers in a small clust. umbel
11349 Leaves serrated unequally pinnate of about 5-pairs, Pinnæ confluent, Peduncle 1-flowered Fl rayed
11350 Lvs. serrated unequally pinnate of about 2-pairs, Pinnæ confluent, Peduncle 1-flowered Inner scales of involucre long
11351 Lvs. linear lanceolate hirsute revolute at edge, Stem 1-flowered villous. Scales of involucre ovate-lanceolate appressed [colored
11352 Leaves linear entire hirsute, Fl. terminal corymbose
11353 Leaves linear entire downy beneath revolute at edge, Corymb fastigiate
11354 Leaves pinnatifid oblique acute smooth unarmed, Scales of involucre mucronate: inner scarious
11355 Leaves pinnatifid: lobes distant, Stem nearly simple 1-flowered, Involucre globose squarrose
11356 Like S tinctoria, but the lower leaves are oval and entire
11357 Leaves pectinate-pinnatifid naked segments linear unarmed, terminal ovate, Scales of involucre ovate mucronate
11358 Involucre unarmed somewhat awned radiate, Leaves pinnatifid
11359 Leaves ovate pinnatifid toothed unarmed hoary beneath upper sessile Stem 1-flowered Scales of involucre ovate unarmed
11360 Leaves linear entire downy beneath, Corymb nearly simple, Involucre oblong ovate downy
11361 Involucre ovate scales roundish scarious at edge, Leaves lanceolate lower somewhat toothed at base
11362 Stem somewhat downy, Lvs. oblong acute narrowed at base serrated, Fl subsessile, Involucre unarmed
11363 Lvs. downy beneath somewhat toothed: radical cordate stalked, Cauline lanceolate, decurrent, Involucre squarrose

11364 Involucre corymbose somewhat downy, Leaves fleshy smooth radical lyrate hastate, Cauline hastate
11365 Leaves villous beneath toothed radicate ovate-lanceolate Flowers terminal somewhat umbelled
11366 Lvs. downy beneath toothed, radicate ovate-subcordate, cauline ovate-lanceolate Fl terminal somewhat umbelled

11367 Leaves decurrent toothed spiny, Peduncle naked very long 1-flowered Involucre spiny inclining
11368 Lvs half decurrent oblong spiny-toothed somewhat fleshy smooth glaucous beneath, Peduncle very long 1-flowered
11369 Leaves oblong decurrent sinuate spiny with white veins villous beneath, Fl sessile clustered, Involucre cylindrical
11370 Leaves decurrent spinous, Fl drooping, Scales of the involucre lanceolate cottony: outer ones spreading
11371 Leaves decurrent pinnatifid downy segments palmate spiny, Flowers clustered
11372 Leaves decurrent runcinate spiny, Peduncle somewhat downy 1-flowered Involucre ovate mucronate unarmed
11373 Leaves decurrent sinuate spiny smooth, Peduncle short subcorymbose downy
11374 Leaves decurrent spiny glabrous, Peduncle erect 1-flowered unarmed
11375 Lvs decurrent sinuated spinous, Involucre globose nearly sessile its scales linear slightly recurved [lanceolate erect
11376 Lvs decurrent sinuated spinous somewhat cottony beneath, Involucre nearly cylindrical clustered sessile their scales
11377 Lvs decurrent oblong sinuated spiny at edge downy beneath, Fl stalked clustered terminal
11378 Lvs decurrent lanceolate pinnatifid toothed spiny villous beneath, Peduncle 1-flowered, downy, Scales of involucre subulate spiny
11379 Leaves half decurrent lanceolate pinnatifid spiny downy beneath, Peduncle scaly downy
11380 Caul. lvs half decurrent oblong undivided spiny toothed subvillous beneath radicate pinnatifid at base
11381 Leaves decurrent sinuated ciliated naked beneath, Fl stalked heaped
11382 Leaves half decurrent pinnatifid toothed spiny white with down beneath, Fl subsessile terminal clustered
11383 Leaves half decurrent toothed sinuate spiny smooth, Flowers paniculed
11384 Leaves decurrent pinnatifid sinuated downy spiny, Peduncle naked downy, Involucre deciduous
11385 Lvs downy beneath upper finely decurrent linear Stem 1-flowered Scales of involucre lanceolate mucron downy
11386 Lvs. decurrent deeply pinnatifid segments toothed upwards spiny with setaceous ciliæ at end
11387 Leaves half decurrent pinnatifid acuminate: segments 2-lobed ciliated spiny, Peduncle downy
11388 Leaves half decurrent pinnatifid-serrate somewhat spiny ciliated naked radicate undivided, Peduncle very long
11389 Leaves adnate at base lanceolate naked eroded ciliate-spiny unarmed [woolly
11390 Leaves unarmed radicate ovate toothed somewhat cut at base, Cauline sessile pinnatifid linear
11391 Leaves naked radical oblong entire, cauline lanceolate somewhat toothed, Scales of involucre ovate mucronate

and Miscellaneous Particulars.

points with which it is beset. C. marianus, the milk-thistle, derived its name from the Virgin Mary, some of whose milk is said to have fallen upon the leaves of the plant, and changed them to white. An extensive genus of rather handsome weeds. C Personata is said to have been so called, because its ample leaves were formerly used as a mask (*persona*) Some of the gigantic species make handsome ornaments for the shrubbery, but the greatest number are nuisances to the husbandman, some on account of their deep vivacious roots, which cannot be eradicated without extreme difficulty, but the greater number because of their bulky herbage, and the extensive dissemination of their seeds by the wind.

The footstalks of the leaves of most or all of the species of this and the allied genera might be eaten in the manner of Cardoons, if similarly blanched. The dried flowers of C. arabicus and nutans will curdle milk. The seeds of all the species of Serratula, Cnicus, Onopordum, and similar genera, are greedily eaten by small birds, especially the finches

The Carduineæ of M Cassini differ from Carlineæ of the same author, in the filaments being hairy or papillose, from Centaurieæ in the structure of ovarium and of pappus, and from Echinopseæ, to which they bear a general resemblance, by many very important characters. The species inhabit Europe, Asia, and Africa; there are scarcely any in America, and none in the southern hemisphere.

History, Use, Propagation, Culture,

1664. *Silybum* A name under which Greek writers describe a plant not well known at present. Sprengel refers it to S marianum. This plant was formerly cultivated, and the young leaves used in spring as a salad, or boiled as pot greens, the young stalks, peeled and soaked in water, to extract a part of their bitterness, were also eaten, and were said to be excellent. In the spring of the second year, the root is prepared like salsafy or skirret, and the receptacle of the flower is pulpy, and eats like that of the artichoke In Apulia the whole plant is much used as fodder for cattle.

1665 *Cnicus* This is a name under which Dioscorides describes a prickly rough plant; derived from κνίζω, to prick. It is now referred to a tribe of plants having such characters in an eminent degree. Acarna and Erisithales are both names by which the ancients distinguished plants, either the very same as those now so called, or very similar to them. The tender stalks of C palustris, as of most of the species, being peeled, are eatable either raw or boiled C arvensis is well known as one of the most troublesome weeds in arable land. It is never found, however, in very sandy, gravelly, or peaty soils; but generally in such as are loamy and dry. An instance is given in the Farmer's Magazine, of the descending roots of this plant having been dug out of a quarry nineteen feet long, nor is it less remarkable for its horizontal roots Mr Curtis planted about two inches of a root in his garden in April, and by November following it had thrown out under ground stolones on every side, some of them eight feet long; some of these stolones had thrown up leaves five feet

11392 Lvs. amplexicaul. waved spinous : radic. ones pinnati. Scales of invol subfoliac. recurved spinous at margin

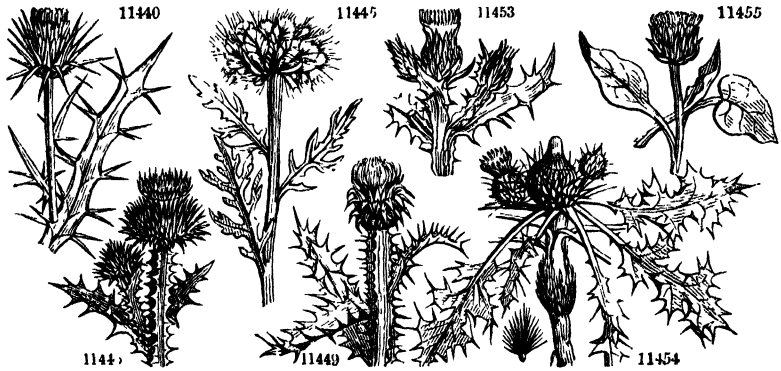
11408 Lvs pinnatifid with strong spines somewhat downy beneath, Fl sess aggregate, Lvs of invol spiny
11409 Lvs halt decurr obl sinuate toothed spiny hoary beneath, Heads close together with appressed scales
11410 Leaves halt decurrent lanc entire ciliated, Pedunc very long 1-fl woolly
11411 Very like C arvensis, but the leaves are decurrent
11412 Stem somew downy, Lower lvs sinuate-toothed with strong spines rough above finely downy beneath
11413 Lvs amplexic hispid pinnatifid segm 2-lobed spreading spiny downy beneath, Heads ov glabrous spiny
11414 Lvs. amplexic hispid pinnatif. segm 2-lobed spread spiny downy beneath, Heads ov. cobwebbed with down
11415 Lvs amplexic hispid pinnatif segm 2-lobed spread spiny beneath naked subvillous, Heads ov cobwebbed
11416 Lvs amplexic. hispid pinnatifid segm 2-lobed spreading spiny naked beneath, Heads ov glabrous
11417 Lvs amplexicaul hispid pinnatifid prickly segm angular lobed spiny, Heads nodding cobwebbed
11418 Stem branched many-fl Heads terminal solitary spiny at base, Lvs amplexicaul sinuate toothed spiny
11419 Leaves sess pinnatifid hispid woolly beneath segm 2-lobed spreading spiny, Invol ovate woolly
11420 Leaves sess lanc. cut-toothed. radical pinnatifid, Scales of invol ovate lanc membranous at edge
11421 Leaves ciliate spiny downy beneath lower stalked obl acum. subsinuate, upper pinnatifid auricled
11422 Like the last, but the leaves of involucrum are reflexed
11423 Leaves obl smooth serrulate with bristly ciliæ blunt mucro Stem corymbose
11424 Leaves unarmed sess obl toothed · radical undivided and pinnatifid, Invol. scarious villous
11425 Leaves sess pinnati spin Stem panicled, Invol ovate, Scales appressed mucronated



11426 Leaves toothed ciliated naked cauline amplexicaul lower and radical pinnatifid, Fl clustered capitate
11427 Leaves amplexicaul ovate sublyrate ciliate serrate scabrous radic lyrate, Fl clustered
11428 Leaves amplexicaul obl lanc toothed ciliate-spiny, Pedunc 1-fl Invol bracteate
11429 Leaves sess pinnatifid segm cut serrate spiny at edge, Invol bracteate, scales ovate appressed
11430 Leaves cordate amplexicaul ovate obl toothed ciliated radical obl blunt ciliated sinuate
11431 Leaves amplexicaul cord pinnatif. ciliate serr Fl terminal subracemose bracteate, Bractes colored ovate
11432 Leaves amplexicaul obl pinnatif toothed spiny hispid above downy beneath, Term fl sess axill. stalked
11433 Leaves amplexicaul pinnatif toothed spiny glabrous, Fl term aggreg sess surrounded by colored bractes
11434 Leaves amplexicaul pinnatifid ciliated, Pedunc cernuous, Invol glutinous scales lanc spreading
11435 Leaves amplexic pinnati-downwards ciliated pinnæ lanc 3-nerved, upper confluent, Pedunc cernuous
11436 Leaves amplexicaul pinnatifid ciliate-spiny. segm 2-lobed toothed upwards at the base
11437 Stemless, Invol glabrous
11438 Leaves sess lanc entire downy beneath with triple spines at the edge, Fl axill sessile
11439 Leaves sess lanc downy beneath subrepand lobes emarg with 2 spines, Fl stalked subcorymbose

and Miscellaneous Particulars

from the original root. The whole together, when dug up and washed, weighed four pounds In the spring following, it again made its appearance, on or about where the small piece was originally planted. There were between fifty and sixty young plants, which must have sprung from fragments of the roots that had eluded the gardener's search, though he was particularly careful in extracting them. From these facts it may readily be conceived how difficult it is to eradicate this weed from arable land, a naked fallow, with frequent and deep ploughing, will not accomplish it, unless the season is more than usually dry Laying land down to grass, keeping it in that state seven or eight years, and during the whole time pulling up every shoot as soon as it appears, is found fully more effectual than a naked fallow But the plant is so common by road sides, and seeds so abundantly, that it is hardly possible to effect its extermination In common field lands, and others indifferently cultivated, it often forms the larger half of the produce, and formerly used to be pulled when beginning to come into flower, and given as food to horses and cows Those who pull this weed require to be furnished with strong gloves, or thistle pincers (*Ency. of Agr* § 2394) Some English botanists seem doubtful if horses and cows will eat it; but those who know any thing of the history of agriculture in Scotland will recollect, that before the introduction of naked fallows and turnips, it formed the *supporting* of housed cattle, during five or six weeks of every summer The ashes of the plant yield a very pure vegetable alkali. C. canus has fleshy white roots like the skirret, and may be dressed and eaten

History, Use, Propagation, Culture,

in the same manner. C lanceolatus is one of the most common and noxious weeds of the genus, chiefly on account of its great bulk, its numerous downy seeds, and the facility with which they are distributed by the wind its dried flowers curdle milk. C helenioides, used to be called the melancholy thistle, and was used by quacks as a cure for madness C Casaubonæ is so named after Casaubona, herbarist to the Grand Duke of Tuscany, who sent the seed to John Bauhin C syriacus is spotted with white, as are a number of Egyptian plants C oleraceus, according to Schreber, is not eaten by cattle, but the Russians are said to boil the leaves in the spring, and eat them as coleworts The tender stalks of C cernuus are so used in Siberia

1666 *Onopordum* A name employed by Pliny for a plant which he describes too imperfectly to be recognized now The virtues which he ascribes to it, and whence the name has been derived (ονος and πεδω), certainly have no existence in the modern genus, which consists of noble thistle-like plants, that, if allowed plenty of room, form very magnificent specimens of annual vegetation O acanthium (from its leaves being like those of the Acanthus) was formerly used like the artichoke and Cardoon The seeds of this plant, until those of other thistles, are strongly defended by the calyx, and are not subject to be blown about by winds The whole plant is white, tomentose, and one of the most magnificent of the family.

1667 *Berardia* So named by Villars, after M Berard, a botanist of Grenoble.

1668 *Cynara* Said to be derived from κυων, a dog, on account of the stiff hard spines of the involucrum, which resemble the teeth of a dog The English word *Artichoke* is said to be derived from the Celtic *art*, a spine, and *chaulx*, a cabbage, but it must be confessed that the word is very like the Arabic name of the plant, *Carcioffo* or *Kharchuf* C scolymus is a well known garden esculent In some parts of France and Italy it is eaten raw in its wild state by the common people According to Gerarde, it was introduced into this country from Italy, but is become, "by reason of the great moisture which our country is subject unto," greater and better than those of Italy, a circumstance not to be doubted, and applicable to many other plants of culture, for it is a fact, that art can in many cases surpass nature, always, however, working upon nature's principles The artichoke is one of those plants the most patient of drought, and in this unusually dry and hot season (1825) was almost the only vegetable procurable in the neighbourhood of Paris, during three or four weeks in July and August Once in the seventeenth century, and again about 1739, most of the artichokes in England were destroyed by frost, but replaced from France There are three varieties in cultivation, the conical, French, or oval; the globe, which has a large dusky purplish head, and the dwarf globe, a prolific variety, which is smaller The parts used are the lower part of the leaves of the calyx, the fleshy receptacles of the flower, freed from the bristles and seed down, vulgarly called the choke, and some-

11471 Stem many-fl. Leaves decurrent

and Miscellaneous Particulars

times the tender central leafstalk in a blanched state like the Cardoon Medicinally, the plant is reputed to be aperient, stomachic, and somewhat heating It is said to dye a good yellow, and the flowers curdle milk

The plant is propagated by suckers in March and April, and requires a light rich soil, well dunged, and pulverised to a good depth. The leaves being large, the plants are placed in rows at four feet distance, and two feet apart in the row They will produce some heads the first season, a full crop the next, and, if well manured, will last for five or six years The plants require to be covered a foot thick with litter during winter, which is removed, and the ground dressed in March and April The heads will appear in the beginning of June.

When the artichoke is to be cultivated as Cardoon, the plants are to be cut over by the surface about mid-summer, in September they will have produced leaves about two feet high, they are then bound close with a wreath of hay or straw, and earth drawn round them The blanching will be perfected in a month or six weeks.

Bauhin thought the Cardoon a hybrid from the common artichoke, to which it bears a great resemblance The tender stalks of the inner leaves, rendered white and crisp by earthing up, are used for stewing, and for soups and salads during winter, like celery. It requires the same soil as the artichoke, to be planted at three or four feet apart in May, or sown where it is to remain in March. In September the leaves may be tied together and earthed up, and in October and November they will be blanched from one to three feet in length

With the florets of Cynara Cardunculus, which the Portuguese call *Cardo do coalho*, milk was formerly coagulated by the people of Portugal, as it is by rennet in England

1669. *Carlina* Olivier de Serres says, this plant was named after the famous Charlemagne, whose army was cured of the plague by means of this plant. Linnæus ascribes the name to the Emperor Charles V., whose army was relieved from the plague in Barbary in the same way. C. acaulis has black woody roots an inch thick, the upper part of which, with the receptacle of the flower, when tender, may be eaten, but the root of the adult plant becomes acrimonious, and is recommended as an alexipharmic. It contains an acrid resinous principle, by which it stimulates the solids, dissolves the humours, and promotes perspiration. C vulgaris is found all over Europe in dry barren soils. The flowers expand in dry, and close in moist weather, retaining this property a long time.

Upon this and a few other genera M. Cassini has founded a tribe, which he denominates Carlineæ, which although possessing no very precise characters of difference, is, he believes, distinct from both his Centaurieæ and Cardumeæ, from which it may always be distinguished by the perfect smoothness of the filaments The species of Carlineæ are found in every part of the world.

History, Use, Propagation, Culture,

1670 *Atractylis* Vaillant (*Mem Acad. Sc* 1718.) derives this from ατρακτος, a distaff, because the light stems were very fit to make spindles

1671 *Acarna* A name under which Theophrastus describes a plant resembling a thistle Willdenow applied it to the present genus, which consists of thistle-like plants

1672 *Stokesia.* Named in honor of Jonathan Stokes, M.D, well known as the coadjutor of Dr Withering in his botanical arrangement of British plants A perennial plant, with large handsome blue flowers.

1673. *Stobæa* Named after Dr. Stobæus, of Lund, one of Linnæus's earliest patrons, and said to have been a practical naturalist

1674 *Onobroma* From ονος, an ass, and βρωμα, food, in allusion to the worthlessness of its herbage. Thistle-like plants of little beauty

1675 *Carthamus* From its Arabic name *qortom*, a word which signifies to paint, on account of the fine color yielded by the flowers. Tournefort, with little reason, derives it from the Greek καθαιρω, to purge The flowers of Carthamus tinctorius are used by the Chinese to give some of the fine rose, scarlet, purple, and violet colors to their silks. For this purpose, the flowers are thrown into an infusion of some alkali, and left to macerate; the colors are afterwards drawn out by the addition of lemon juice in various proportions, or of any other vegetable acid.

It is cultivated at present in many parts of Europe, and in the Levant, whence great quantities are annually imported into England for dyeing and painting In Spain it is grown in gardens, as Marygolds are in England, to color soups, olives, and other dishes The Jews in Poland are remarkably fond of it, and mix it with their bread, and most of their viands According to Houghton, it was formerly cultivated in Gloucestershire, both for the flowers and seed. The common people took it for saffron, and used it in their puddings, cakes, and

11472 Stem and leaves smooth

11473 Stemless, Leaves pinnatifid, Outer leaves of involucre tricuspidate
11474 Stem branched, Leaves lanc. ciliate toothed downy, Outer leaves of involucre setaceous pinnatifid conniving [larger than flower

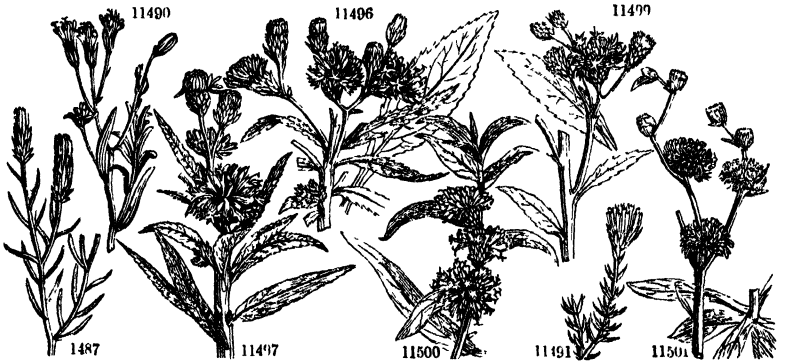
11475 The only species

11476 Leaves downy pinnatifid · pinnæ linear terminated by a spine

11477 Stem about 1-fl Leaves ovate lanc spiny-toothed

11478 Stem shrubby, Leaves sessile lanceolate downy beneath spiny-toothed, Branches 1-flowered

11479 Stem quite smooth, Leaves ovate entire spiny toothed, Fruit naked
11480 Stem woolly, Lower leaves pinnatifid toothed upper amplexicaul pinnatifid toothed spiny
11481 Stem smoothish, Involucre somewhat woolly, Lower leaves lyrate upper half-amplexicaul
11482 Radic leaves pinnated cauline pinnatifid, Stem 1-flowered
11483 Leaves unarmed radical toothed, cauline pinnate
11484 Cauline leaves linear pinnated as long as plant
11485 Leaves ensiform sinuate toothed



11486 Spiny much branched with small blue flowers

11487 Leaves sessile linear toothletted downy beneath, Inner scales of involucre lanc long
11488 Leaves stalked ellipt blunt entire silky with down beneath
11489 Leaves lin clustered very long revolute at edge hoary beneath, Branches downy

11490 The only species

11491 Leaves scattered and fascicled filiform ciliated, Leaves of involucre ciliated, Hairs of receptacle clustered
11492 Lvs scattered and fascicled filiform subciliate at base, Lvs of involucre entire, Holes of receptacle multipartite
11493 Leaves connate linear filiform glabrous, Scales of involucre ovate, Stem wavy, Fl terminal in threes stalked
11494 Leaves ovate powdery downy, Scales of involucre ovate entire
11495 Leaves ovate smooth, Scales of involucre ovate mucronate membranous

11496 Leaves lanc scabr serrulate, Corymb fastigiate, Scales of involucre filiform at end
11497 Leaves ovate-lanc serrate downy beneath, Corymb fastigiate, Scales of involucre ovate acuminate
11498 Stem simple, Lvs many long and narrow lin nearly entire, Corymb somewhat umbell. Scales of involucre stiff
11499 Leaves oblong acuminate serrate, Corymb fastigiate, Scales of involucre ovate acute [mucronate
11500 Leaves linear-lanc silky beneath downy on each side nearly entire, Flowers alternate 1-sided sessile
11501 Stem straight dichotomous upwards branches flexuose, Heads in the forks of the branches sessile

and Miscellaneous Particulars

bread, but by putting in too great a quantity they found it communicate a purgative quality, and gave up its use It is still, however, used in this way by some pastrycooks In Germany it is cultivated on light land well pulverised; it is sown in rows about eighteen inches distance, and afterwards thinned to three or four inches apart in the row · in September the plants begin to flower, and the field is then gone over once a week, for six or seven weeks, to gather the expanded florets, which are dried in a kiln in the same manner as true saffron Turkeys and geese are said to feed greedily on the seed, and in a short time become very fat

C lanatus is used by the women of the south of France and Spain for distaffs, and hence it had the name of distaff thistle. The root of C carduncellus is eaten in Africa.

1676. *Cardopatum.* A name of unknown meaning A spiny branched plant with little blue flowers, formerly referred to Carthamus.

1677 *Stæhelina* One Benoit Stæhelin, a Swiss botanist, published, in 1730, an academical dissertation upon the Filicula saxatilis corniculata and the Equisetum These are pretty half-shrubby thread-leaved plants, mostly deserving cultivation.

1678. *Palafoxia* Named by Lagasca, after the Spanish General Palafox, of whose merits as a botanist we are unmformed A small perennial plant with the habit of Stevia.

1679 *Pteronia.* From πτερον, a wing; altered by Linnæus from the Pterophorus of Vaillant, a word which seems to allude to the feathery scales of the receptacle. A genus of humble rigid shrubs.

1680. *Vernonia* Named after Mr. William Vernon, fellow of St Peter's College, Cambridge, who travelled in North America in search of plants, and left behind him an Herbarium, which came into the hands of Sir Hans Sloane, and contributed to enrich the third volume of Ray's Historia Plantarum. Vernoniæ constitutes the twentieth of M Cassini's subdivisions of Compositæ They are distinguished from Lactuceæ by

Eupátpus paniculátus Hort.

History, Use, Propagation, Culture,

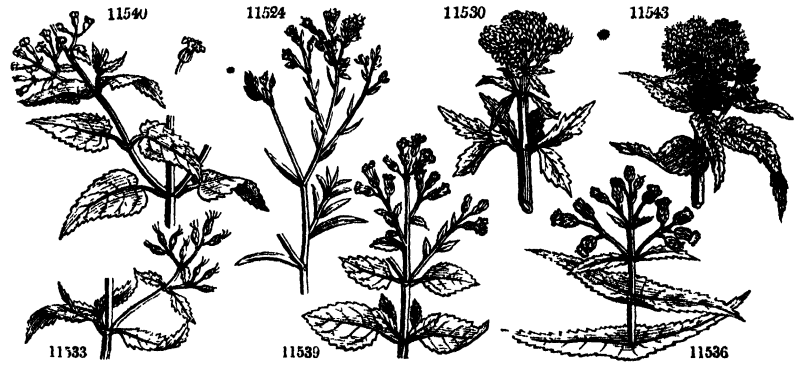
their corolla, which is not ligulate, and from every other tribe by their style, which is absolutely the same as that of Lactuceæ. The greater part of Vernonieæ are found in America, a few in Asia and Africa, but none in Europe.

1681. *Ammobium* From *αμμος*, sand, and *βιω*, to live, in allusion to the places where it grows. A pretty half-hardy New Holland herbaceous plant, with dry white involucral scales, like a Gnaphalium.

1682. *Liatris.* A word of unknown meaning A genus of charming North American herbaceous plants They should be taken out of the borders in the autumn, and preserved in pots till the succeeding spring Of Liatris odoratissima, the leaves when dry give out a very pleasant smell resembling Vanilla, and which lasts for years It is called the Carolina Vanilla plant.

Liatris squarrosa is a very handsome species, with large heads of most beautiful flowers of a rich purple It and L. scariosa are known in North America under the name of rattlesnake's master In case of being bitten by this reptile, the bruised bulbs of the plants are applied to the wound, while, at the same time, a decoction in milk is taken inwardly.

11502 Leaves oval blunt serrate-crenate: lower with a winged amplexicaul. stalk, Fl. subcorymbose
11503 Leaves ovate entire acute downy beneath, Spikes recurved 1-sided, Bractes reflexed
11504 Leaves ovate-lanc. narrowed at each end serrated roughish pubescent beneath, Fl. term. about 3



11505 Leaves oblong wavy decurrent

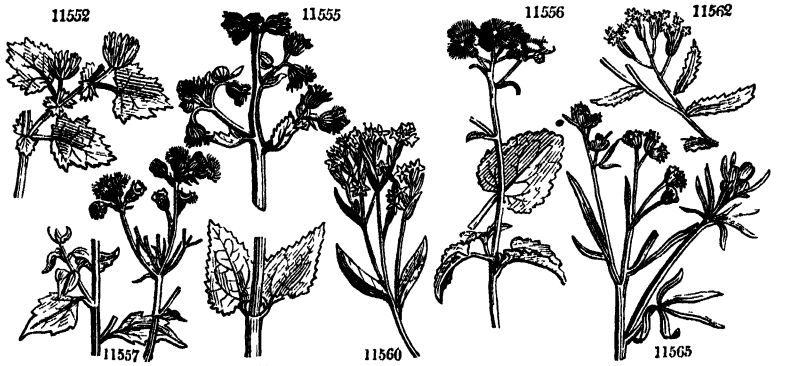
11506 Stem simple pubescent, Leaves very long linear nerved roughish at edge, Racemes few-fl leafy
11507 Stem simple pubescent, Lvs. lanc. narrowed at each end smooth rough at edge, Inv squarrose at bottom
11508 Stem simple pubescent, Leaves smooth: lower stalked broad-lanc. Invol. subglobose with scarious scales
11509 Stem simp. vill. Lvs. lin. subfalc dott rough, Spike somew. leafy, Pedic. short, Inner scales ligul colored
11510 Stem simple pubesc. Lvs lin pilose ciliated, Invol racemose lax, Scales lin obl bluntish [mucronate
11511 Slender all over hairy, Lvs grassy, Spike few-fl. Inv subsess. cylindr few-fl Scales round. at end abruptly
11512 Stem simple smooth, Leaves lanc. smooth: upper lin lanc very small, Invol. spiked subsquarrose
11513 Stem simple hirsute, Lvs. straight narrow-lin downy, Spike long, Fl. closely cluster Inv appress squarrose
11514 Stem simple tall, Lvs lin. smooth ciliated at base nerved and dotted, Spike very long, Fl sessile [at end
11515 Quite smooth, Stem simple, Rad leaves obl.: cauline amplexicaul Panicle corymbose lax spreading
11516 Dwarf, Leaves linear, Stem simple, Flowers spiked

11517 Stem climbing, Leaves ovate entire, Flowers spiked
11518 Stem climbing, Leaves subcordate hastate toothed, Flowers in spikes
11519 Stem climbing smooth, Lvs. cord. repand toothed acuminate with spreading unequal lobes, Fl. corymbose

11520 Flowers sessile lateral
11521 Flowers axillary sessile, Corollas all trifid

11522 Leaves lanc veiny obsoletely serrate smooth, Invol 4-fl Stem shrubby
11523 Stem panicled, Leaves smooth lower pinnated, upper fascicled, all filiform
11524 Leaves opp subverticill linear entire pubescent 3-nerved dotted radical somewhat toothed
11525 Leaves sessile amplexicaul distinct ovate-lanc rounded at base serrated smooth, Stem smoothish
11526 Leaves sessile distinct ovate scabrous upper coarsely serrated at base, uppermost entire
11527 Leaves sessile distinct roundish cordate bluntly serrate veiny
11528 Leaves subsessile lanceolate 3-nerved narrowed at each end downy lower serrated in middle
11529 Leaves stalked 3 or 4-nate ovate narrowed at each end serrated roughish
11530 Leaves opposite subpetiolate tri-quinque-partite: their segments lanceol deeply serrate
11531 Leaves petiolate ternate and simple downy beneath unequally serrate, Stem smooth
11532 Leaves stalked 4 or 5-nate ovate lanceolate serrate rugose veiny roughish, Stem hollow
11533 Leaves stalked 4 or 5-nate ovate lanceolate unequally serrate downy beneath, Stem solid furrowed
11534 Leaves stalked 4 or 5-nate ovate acuminate serrated scabrous on each side, Stem solid round
11535 Leaves stalked 3 or 4-nate ovate-lanceol. cuneate at base unequally serrate smoothish, Stem solid smooth
11536 Leaves connate perfoliate downy
11537 Leaves stalked cordate ovate bluntish 3-nerved bluntly serrate, Fl. corymbose
11538 Hispid, Leaves stalked cordate cut serrate, Panic terminal, Invol many-fl subulate pungent
11539 Leaves stalked ovate acute 3-nerved bluntly serrate glabrous, Stem panicled upwards, Fl corymbose
11540 Leaves stalked ovate acuminate 3-nerved unequally coarsely serrated smooth, Corymb many-fl. spreading
11541 Leaves stalked triangular ovate serrated entire at end downy beneath, Corymbs spreading term sessile
11542 Leaves narrow lanceol 3-nerved subserrated, Invol squarrose many-flowered
11543 Leaves amplexicaul. lanc acuminate rugose serrated, Flowers panicled clustered
11544 Leaves stalked ovate acuminate unequally and bluntly crenated pubescent, Panicle contracted
11545 Leaves stalked ovate acuminate toothed 3-nerved glabrous
11546 Stem twining villous, Lvs deltoid ovate acute 3-nerved soft beneath, Panicle term. trichotomous diffuse
11547 Like E. lamiifolium, but the flowers smaller and panicled

and Miscellaneous Particulars



1683 *Mikania* Named by Willdenow, after Professor Mikan, of Prague. Climbing tropical plants, one of which, M Guaca, is employed in South American medicine as a powerful febrifuge.

1684. *Sparganophorus.* From σπαργανον, a fillet, and φερω, to bear, because the seed is crowned with a membranous band or border

1685. *Eupatorium.* This plant, says Pliny, derives its name from Eupator King of Pontus, who first used it in medicine. *Aya-pana* is the vernacular name of the species so called among the natives of the banks of the river Amazon. The tribe of Eupatorieæ is distinguished from Vernonieæ by its style. They are chiefly found in America, very few inhabit Asia, scarcely any Africa, and not one has been found in Europe.

The Eupatorium perfoliatum has some reputation as a medicinal plant. A dissertation upon the subject of its merits was published a few years since by an American physician, from which it appears that the virtues of the plant reside chiefly in the leaves, and that the most efficient mode of exhibiting it is by means of a simple decoction The medical powers of Eupatorium are, as its sensible properties would seem to indicate, those of a tonic stimulant. Given in moderate quantities, either in substance, or in cold infusion or decoction, it promotes digestion, strengthens the viscera, and restores tone to the system. Like other vegetable bitters,

History, Use, Propagation, Culture,

if given in large quantities, especially in warm infusion or decoction, it proves emetic, sudorific, and aperient. Even in cold infusion, it tends to bring on diaphoresis. The plant is also stated to be an excellent remedy for the cure of intermittent fevers When employed as a tonic, this plant may be taken in doses of twenty or thirty grains, or a teacup full may be used of the infusion rendered moderately bitter When intended to act as an emetic, a strong decoction may be made from an ounce of the plant in a quart of water boiled to a pint (*Ruggelow.*)

1686. *Dumerilia* Named after M A M. Constant Duméril, author of an Elementary Treatise upon Natural History, published in one volume octavo, at Paris, in 1804 Small half-shrubby South American plants, with firm hairy leaves

1687. *Ageratum* A name employed by Dioscorides, and probably applied by him to some plants similar to what we call properly "everlastings," it is derived from *α*, privative, and *γηρας*, old age, because it never grows old; that is to say, always preserves its color

1688. *Cælestina* From *cælestis*, blue, in allusion to the color of the flowers.

1689. *Stevia.* Dedicated by Cavanilles to the memory of Peter James Esteve, a Spanish physician of the sixteenth century. He left behind him a dictionary of the plants natives of the kingdom of Valentia.

1690. *Cephalophora* From *κεφαλη*, a head, and *φερω*, to bear, its flowers being united in little heads.

1691. *Amperephis.* From *αμφηρεφης*, which signifies well covered, on account of the double involucrum of the genus.

11548 Lvs. sessile distinct ovate scabrous veiny: lower doubly serrate; upper subserrate, Stem panicled downy
11549 Leaves stalked cordate acute subserrate villous beneath, Involucre 8-15-fl Stem shrubby
11550 Leaves stalked hastate triangular 3 nerved unequally serrate downy beneath, Panic corymbose
11551 Stem twining, Leaves reniform ovate acuminate serrate-toothed, Panicle axillary

11552 Leaves roundish 7-lobed · lobes crenate, Panicle corymbose terminal

11553 Leaves ovate subcordate, Stem hairy, Paleæ of pappus awned toothletted
11554 Leaves ovate cuneate at base, Stem pilose, Paleæ of pappus lanceolate acute
11555 Stem erect simple scabrous, Leaves cordate rugose unequally serrated
11556 Hispid, Leaves cordate ovate crenate rugose, Corymb compound, Paleæ of pappus lanceolate awned

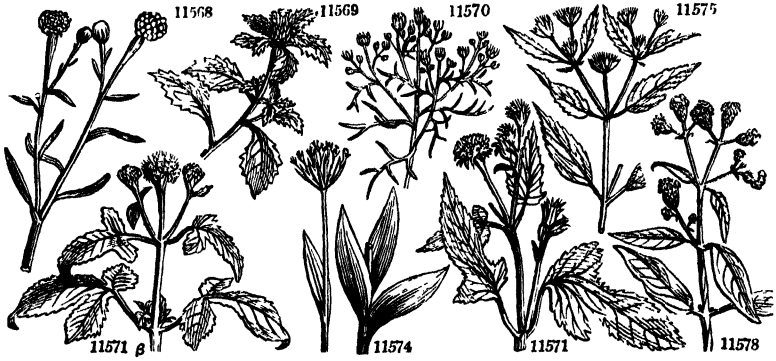
11557 Leaves stalked ovate acute rounded at base serrated pilose above hairy beneath

11558 Leaves lanc channelled narrowed into the footstalk 3-nerved, Corymb fastigiate
11559 Leaves lanc 3-nerved entire. Corymb fastigiate, Pappus paleaceous and awned
11560 Leaves oblong ovate entire, Corymbs spreading, Pappus awned as long as corolla
11561 Leaves lanc narrowed at each end serrated in the middle, Corymb spreading, Pappus with 2 awns
11562 Leaves lin lanc serrated at end, Corymbs fastigiate, Pappus paleaceous and awned
11563 Leaves lanc narrowed into the footstalk 3-nerved finely serrated at end, Corymbs fastigiate
11564 Leaves ovate 3-nerved serrated cuneate and entire at the base, Pappus chaffy and awned
11565 Leaves stalked digitate pedate entire, Pappus paleaceous (*Florestina*, Cass)
11566 Leaves sessile narrowed at base rough with minute hairs, Pappus with 3 awns
11567 Leaves 10 lines long 4 lines broad finely downy beneath, Flowers purple

11568 The only species

11569 Leaves of involucre foliaceous · inner ovate obl rounded, outer awned

11570 Hoary, Leaves sub-bipinnatifid, Flowers in compound corymbs



11571 Leaves 3-nerved ovate acuminate scabrous unequally toothed

11572 Flowers solitary stalked winged, Leaves oblong triple nerved unequally serrated scabrous

11573 Leaves long-lanc Leaves of involucre blunt, Paleæ spatulate
11574 Leaves lanc oval acuminate 3-nerved, Paleæ narrow linear

11575 Leaves lanceolate serrate, Stem erect
11576 Leaves ovate repand, lower alternate, Stem branched ascending, Involucre many-leaved
11577 Leaves ovate subcordate serrated, Stem branched diffuse

11578 Leaves opp ovate-acumin serrate, Peduncle panicled, Heads ovate
11579 Leaves opp ovate-lanceolate entire downy, Peduncle opp diverging many-flowered

and Miscellaneous Particulars

1692 *Hymenopappus.* From ὑμην, a membrane, and παππος, pappus, in allusion to the membranous pappus of its seeds

1693 *Melananthera.* From μελας, black, and *anthera.* A plant with black anthers, a very unusual character in this tribe of plants, the anthers of which are usually either white or yellow, according to the color of the corolla

1694 *Marshallia* Named after Henry Marshall, an Englishman, author of a sort of history of the trees and shrubs of North America, published in 1778.

1695. *Spilanthes* From σπιλος, a spot, and ανθος, a flower, in allusion to the heads of flowers of the original species, which are yellow with a brown disk. Jacquin says he so called it, because the flowers are spotted with black points. S salivaria is used by the natives of South America to relieve the tooth-ache by the salivation which it produces copiously The flower-heads of S. oleracea are an excellent ingredient in salads, on account of their agreeable and lasting piquancy.

The leaves of Spilanthes tinctoria of Loureiro, which is said to be very similar to the Abcedaria figured by Rumphius, vol. v t 65, give out when bruised a beautiful blue color, quite equal to indigo.

1696. *Salmea.* This name was originally given by Cavanilles to a genus related to Aloe, and was named after Prince Charles of Salm-Salm, a great promoter of botanical science. It was transferred to the genus which now bears the name by Professor Decandolle, in the appendix to his Hortus Monspeliensis.

History, Use, Propagation, Culture,

1697. *Bidens.* So called because its seeds are surmounted with two teeth. Very worthless inconspicuous weeds

1698. *Platypteris* So called from πλατυς, broad, and πτερον, a wing, in allusion to the margin of the seeds. A small stove herbaceous plant of little merit

1699. *Lagasca* Named in honor of Don Mariano La Gasca, professor of botany at Madrid, an amiable man and excellent botanist. He is, at the time of writing this, residing in England, whither he has fled from the dangers of persecution in his own country

1700. *Lavenia.* A name of unknown meaning, originating with Sherard. Small useless annuals, natives of the East and West Indies

1701. *Cacalia.* A name applied by Dioscorides to a mountain plant with large whitish leaves By some it is believed to have been what is now called Cacalia alpina. To Sprengel it appears to be the Bupleurum

11580 Flowers discoid stalked, Outer involucre 3 times as long as flower, Lvs. ovate with 1 or 2 teeth on each side
11581 Leaves tripartite, Leaflets lanceolate deeply serrated, Bristles of the pericarp 2-3
11582 Fls. droop Bractens lanc ent. (longer than involucre) Lvs lanc serrat. undivid. Bristles of pericarp about 4 erect
11583 Flower radiant erect, Outer involucre longer than inner, Cauline leaves lanc. serrated · radical subternate
11584 Fls. discoid, Outer involucre 6 times as long as flower, Leaflets ciliated at base, Lower lvs pinn · upper ternate
11585 Fls radiant, Outer involucre the length of inner, Lower leaves pinnate · upper ternate, Leaflets ovate serrated
11586 Fls. radiant, Outer involucre length of inner, Low lvs. pinn. . upper tern Leafl ovate or subcord serr uneq at base
11587 Fls discoid, Outer involucre length of inner, Low. lvs. pinn : upper tern Term. leafl twice as large as the rest
11588 Flowers radiant, Outer involucre longer than inner, Leaves decussively pinnated serrated
11589 Flowers subradiant, Outer involucre length of inner, Leaves bipinnate leaflets lanc pinnatifid
11590 Fls. discoid, Outer involucre longer than flower, Lvs scabr toothed low roundish ovate · upper tern. Stem hairy
11591 Leaves bi-tripinnate · pinnæ linear acute channelled entire, Outer leaves of involucre blunt downy
11592 Flowers radiant erect, Outer involucre longer than inner, Leaves lanc stalked equally serrate
11593 Leaves lanc acute serrated subciliated, Outer involucre leafy
11594 Flowers discoid, Outer involucre 3 times as long as flower, Cauline leaves ternate lateral connate
11595 Flowers discoid, Outer involucre longer than inner, Leaves ternate : leaflets 3-parted cut-toothed
11596 Flowers radiant, Outer involucre length of inner, Leaves bipinnate, Leaflets cuneiform 3-toothed
11597 Leaves lyrate-pinnated: pinnæ ovate acute serrated pubescent, Flowers panicled

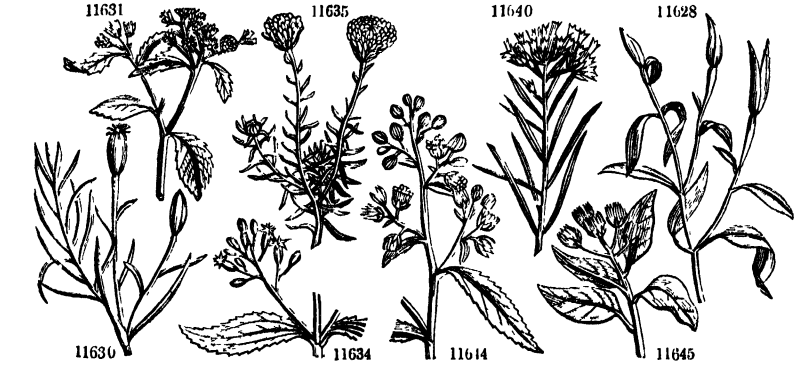
11598 Leaves hoary toothed, Stem with 4 wings

11599 Leaves stalked ovate acuminate subcrenate softly silky
11600 Leaves on short stalks elliptical blunt obsoletely toothed rigid

11601 Stem branched erect, Leaves elliptical finely serrated

11602 Stem shrubby with cylindr truncate papillæ, Leaves lanc flat
11603 Stem shrubby, Leaves ovate-oblong flat, Petioles with a triple line at base
11604 Stem shrubby, Leaves lanc flat, Flowers corymbose
11605 Stem shrubby, Leaves compressed fleshy
11606 Stem shrubby, Leaves roundish fleshy incurved, Pedunc terminal 1-fl naked
11607 Stem shrubby, Leaves depressed fleshy
11608 Stem shrubby, Leaves depressed fleshy woolly

11609 Stem shrubby, Leaves fleshy flat ternate, Leaflets 3-lobed
11610 Stem suffruticose, Leaves ovate-lanc toothed downy beneath
11611 Shrubby downy, Leaves cordate ovate acute angular downy beneath . stalks with leafy appendages
11612 Stem herbac branched, Lvs lanc smooth toothed of the stem amplexicaul, of the branches stalked
11613 Leaves thickish villous lower oval repand-toothed stalked, upper sublyrate amplexicaul
11614 Stem herbaceous, Leaves amplexicaul toothed lower lyrate, upper sagittate toothed
11615 Leaves obl lanceolate connate downy beneath, Racemes axillary
11616 Radical leaves ovate spatulate cauline entire amplexicaul crenate edged
11617 Stem herbaceous, Leaves sessile obl lanc serrated at the base cuneate entire decurrent
11618 Stem herbaceous, Leaves stalked 3-lobed hastate serrate, Flowers racemose nodding
11619 Stem herbaceous, Lvs stalked rhomboid hastate unequally toothed, Flowers corymbose spreading erect
11620 Stem herbaceous, Leaves stalked hastate-sagittate serrated, Flowers corymbose erect
11621 Stem herbaceous, Leaves stalked radical cordate toothed, cauline rhomboid with 2 teeth on each side
11622 Stem herbaceous, Leaves stalked radical cordate reniform repand toothed, cauline oblong toothed
11623 Stem herbaceous, Leaves stalked cordate toothed, Petioles naked, Corymbs fastigiate, Involucre 5-flowered
11624 Stem herbac Leaves stalked cordate toothed hoary beneath, Petioles auricled at base, Corymbs fastigiate
11625 Stem twining, Leaves triangular sinuate-toothed
11626 Stem herb Rad lvs bipinnatifid · caul pinn Pinnæ toothed upper confluent, Corymb comp fastigiate
11627 Stem herbaceous, Leaves toothletted lower stalked obovate, upper obl lanc sagittate amplexicaul



and Miscellaneous Particulars

longifolium of the moderns. The species are nearly all objects of ornament Some of them are remarkable for their fleshy awkward looking stems, others for their discolored leaves The succulent kinds require to be grown in old rubbish, and to be treated as directed for Mesembryanthemums The leaves of some species (C procumbens and sonchifolia) are used as salad by the Chinese, and those of C. Ficoides are sometimes pickled by the French.

C Kleinia is called cabbage tree, from the resemblance which the stalks have to those of the cabbage, and carnation tree, from the shape of the leaves and color of the flowers

Upon Cacalia alpina, &c, M Cassini has founded his genus Adenostyles and tribe of Adenostyleæ, distinguished from Senecioneæ, to which Cacalia belongs, by the roughness of all the back of the two lobes of the style But we do not find the division adopted by other botanists M. Cassini himself suspects that Adenostyleæ may be united with Tussilagineæ.

History, Use, Propagation, Culture,

1702. *Kleinia* Named after James Henry Klein, a German botanist, who published, in 1719, a dissertation upon the Juniper

1703 *Ethulia* A word formed by Linnæus without any explanation of its meaning It is not easy to understand wherefore Vaillant's more ancient name of Sparganophorus should not have been adopted

1704. *Piqueria* So named by Cavanilles, in honor of Andreas Piquerio, a Spanish botanist, who published a translation of Hippocrates, in 1757

1705. *Chrysocoma* From χρυσος, gold, and κομη, hair, in allusion to the tufts of yellow flowers with which the stems are terminated The specific name Comaurea is a mere translation of the generic appellation. Linosyris, the name of another species, is so called from *linum*, flax, and *osyris*, an ancient name for a plant with long flexible branches and flax-like leaves, which is the character of C linosyris, which, when handled, sends forth a very fine aromatic smell

1706. *Tarchonanthus* *Tarchon* is a name given by the Arabian physicians to the Artemisia Dracunculus, and is the root of our English word *Tarragon*. Ανθος signifies flower, and the word thus compounded may be Englished Tarragon-flower

1707. *Calea* Derived from καλος, beautiful The species are ornamental shrubs of South America, with undivided leaves, and corymbose, terminal, or axillary heads of yellowish purple flowers Mr. Brown's history

11628 Leaves obl lanc acute at each end nearly entire
11629 Leaves elliptical blunt mucronate repand with pellucid dots
11630 Leaves linear entire with pellucid dots, Stem suffruticose

11631 Flowers panicled
11632 Leaves linear toothed decurrent, Pedunc. opposite the leaves 1-fl Stem divaricating
11633 Stem winged, Leaves lanc acute serrated downy decurrent, Flowers corymbose

11634 Leaves opp. ovate-lanc serrated 3-nerved, Invol with 4 flowers

11635 Leaves linear straight smooth decurrent at back
11636 Leaves linear recurved roughish, Flowers cernuous
11637 Leaves linear straight ciliated, Branches pubescent
11638 Leaves lanc ovate recurved toothletted serrated, Peduncles pubescent
11639 Leaves oblong tapered at base toothletted wavy
11640 Leaves linear glabrous, Involucres lax
11641 Leaves linear-lanceolate 3-nerved scabrous, Flowers corymbose, Invol lax
11642 Panicled, Leaves lanc 3-nerved dotted naked
11643 Leaves lanc. villous, Involucres contracted

11644 Leaves oblong entire downy beneath

11645 Flowers about 3 stalked, Leaves ovate-oblong subserrate stalked

11646 Corymbs heaped, Peduncles very long, Leaves lanc Stem herbaceous

11647 Leaves opp undivided, Panicle terminal brachiate

11648 Corymbs heaped, Leaves alternate: upper ovate-lanceolate, lower toothed hastate sinuate serrate

11649 Panicles very large erect diffuse capillary

11650 Leaves lanc. narrowed at base serrated alternate

11651 The only species

11652 Pedunc 1-fl Leaves hoary toothed in 4 rows, Teeth blunt, Branches dowy, Invol pubescent
11653 Pedunc 1-fl. Leaves hoary toothed in 4 rows, Teeth subulate much spreading, Branches downy
11654 Pedunc. 1-fl Leaves smooth toothed in 4 rows, Teeth subulate straight, Branches and invol smooth
11655 Pedunc 1-fl Leaves linear warted at edge upper entire
11656 Pedunc 1-fl Leaves bipinnate, Stems simple
11657 Pedunc 1-fl Leaves bipinnate, Stems much branched villous
11658 Like Santolina alpina, but segments of leaves are shorter and thicker

and Miscellaneous Particulars

of this genus, in the twelfth volume of the Transactions of the Linnean Society, is a model of botanical erudition and acuteness, such as has been rarely seen in modern days

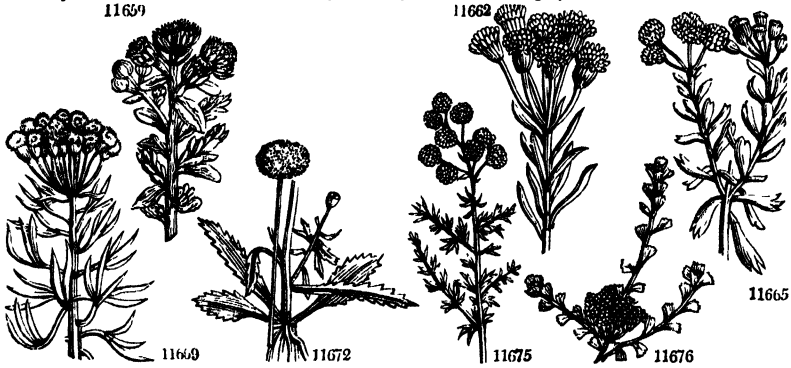
1708 *Isocarpha.* From ισος, equal, and καρφη, chaff, in allusion to the equality of the chaff of the receptacle and the leaves of the involucrum Herbs of South America, with opposite undivided leaves, and ovate terminal heads of whitish flowers

1709 *Petrobium* From πετρος, a stone, with reference, it is presumed, to the texture of the grains A small tree, native of St Helena, where it is called *white wood*

1710. *Neurolæna.* From νευρον, a nerve, and λαινος, stony. An erect shrub of South America, with alternate, undivided, and lobed leaves, and terminal compound corymbs of yellow flowers

1711 *Humea* Named in honor of Sir Abraham Hume, Bart. of Wormleybury, in Hertfordshire, a gentleman whose whole life has been devoted to the protection and assistance of the arts and sciences, and especially of botany. A beautiful plant with immense capillary panicles of brilliant crimson flowers

1712. *Cæsulia.* Meaning unknown Little creeping weed-like plants, rooting at the joints



1713. *Ixodia* From ιξωδης, viscid. A greenhouse shrub, native of the south coast of New Holland, flowering most part of the year

1714. *Santolina.* Supposed to be a diminutive of *sancta*, a holy little herb, in allusion to some reputed virtues A genus of slightly shrubby somewhat aromatic plants, with yellow discoid flowers

History, Use, Propagation, Culture,

1715 *Otanthus.* From ωτος, an ear, and ανθος, a flower, in allusion to the appendages which are placed on each side of the base of the florets. An infusion of the leaves and stem is said to be employed successfully in the east in cases of stone and gravel

1716. *Caleacte.* So called because it is the ornament of the sea coasts where it grows, and derived from καλος, beautiful, and ακτη, the sea shore

1717. *Athanasia* From α, privative, and θανατος, death; that is to say, a plant which does not perish. But the application of the word, as far as the present genus is concerned, is far from obvious.

1718 *Balsamita* Derived from βαλσαμον, balm, in allusion to its strong balsamic smell Ugly plants of no merit whatever. B vulgaris has the English name *Costmary*, from the Greek Κοστος, an aromatic shrub, and Mary; the Virgin Mary's costus. from its being put into ale, it has our old English name of *Ale-cost.* It is more aromatic and has a pleasanter smell than tansy, to which it is nearly allied

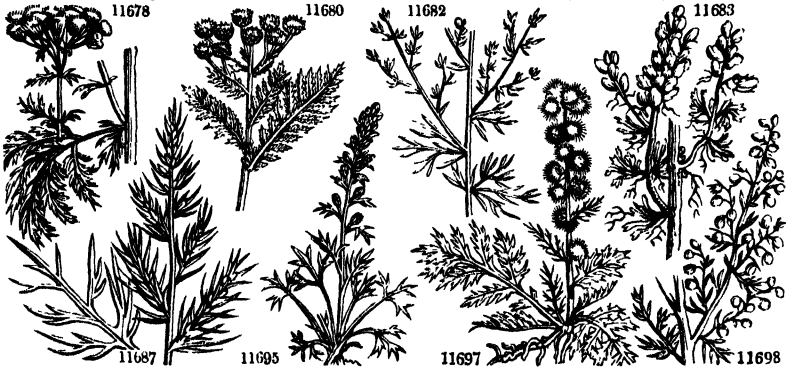
1719. *Pentzia.* Named by Thunberg, after his pupil Charles John Pentz. A bushy branching hoary shrub, with little yellow flowers.

11659 Pedunc. corymbose, Leaves oblong blunt crenated densely woolly

11660 The only species

11661 Leaves ovate villous, Heads terminal subsessile
11662 Leaves obov lanc. blunt villous, Umbels terminal, Branches villous
11663 Corymbs simple contracted, Leaves pinnatifid toothed
11664 Corymbs compound, Leaves recurved lower linear toothed, upper ovate serrate
11665 Leaves cuneiform cut-trifid, Flowers in umbels
11666 Leaves cuneiform · lower pinnatifid cut: upper 3 or 5-toothed, Flowers in umbels
11667 Leaves linear tomentose, Panicle compound
11668 Leaves linear filiform smooth, Flowers panicled
11669 Leaves trifid with linear smooth segments, Flowers somewhat in umbels
11670 Leaves pinnated: pinnæ linear smooth, Panicle decompound
11671 Leaves pinnated: pinnæ linear smooth, Panicle compound

11672 Stem herbaceous branched at base, Branches 1-fl Leaves sessile lanc serrated
11673 Leaves obovate serrated sessile clustered, Flowers subcorymbose
11674 Leaves ellipt. toothed: lower stalked, upper sessile auricled at base, Flowers corymbose
11675 Radical leaves bipinnate: cauline many pinnated downy, pinnæ linear acute mucronate



11676 Corymbs simple, Leaves deltoid serrated at end

SUPERFLUA.

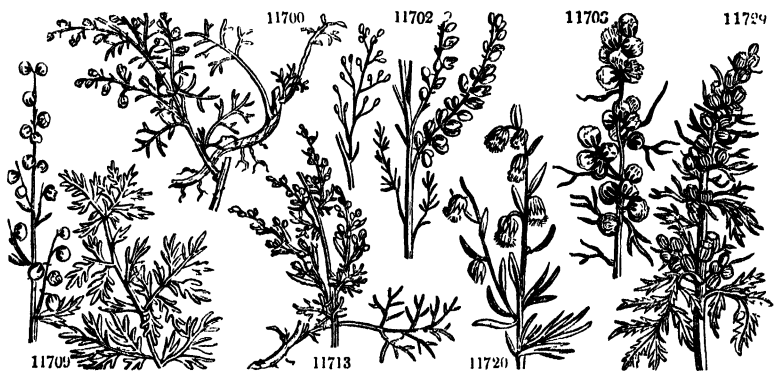
11677 Leaves lanceolate channelled, Raceme terminal fastigiate
11678 Leaves pinnated · pinnæ linear toothed pubescent, Corymb fastigiate leafy at base
11679 Leaves pinnated silky with down, Pinnæ lanc somewhat toothed at end, Corymb terminal
11680 Leaves bipinnatifid incise-serrate

11681 Leaves pinnatifid: segm. lanceolate serrated, Corymb contracted, Invol angular

11682 Leaves obovate blunt lobed small, Flowers panicled stalked
11683 Leaves hoary: lower pinnated with palmate pinnæ, upper palmate sessile, Heads panicled simple
11684 Cauline leaves pinnated smoothish. floral undivided linear, Panicle virgate, Heads glob stalked nodding
11685 Stem upright, Lower leaves bipinnate upper pinnated capillary, Invol downy hemispherical
11686 Caul. lvs pinnat. very smooth: floral undivided setaceous, Involucres downy, Heads glob stalk nodding
11687 Stem upright, Leaves bipinnate capillary floral simple, Invol oblong
11688 Leaves tripinnatifid silky cinereous, Leaflets linear, Heads globose, Flowers branched simple
11689 Leaves bipinnatifid silky white, Leaflets lanc linear, Heads globose, Flowers branched virgate
11690 Stem quite simple, Leaves all palmate multifid white, Heads terminal clustered
11691 Stem quite simple, Leaves all palmate multifid white, Lower heads stalked upper sessile
11692 Stem branched spreading, Leaves all bipinnate capillary, Invol smooth hemispherical
11693 Stem quite simple, Leaves all palmate multifid silky acute
11694 Leaves hoary lower cuneiform obtuse 3-lobed, upper linear blunt, Flowers globose stalked cernuous
11695 Stem quite simple, Leaves hoary radical palmate multifid, caul. pinnatifid, upper linear entire blunt
11696 Stem quite simple, Leaves pectinate pinnatifid glabrous, Pinnæ linear filiform, Pedunc 1-fl axillary
11697 Stem quite simple, Lvs bipinnatifid subpub beneath: segm lin lanc acum entire, Raceme naked term
11698 Cauline leaves pinnated linear smooth, Branches undivided, Spikes 1-sided reflexed
11699 Cauline leaves pinnated setaceous smooth. radic pinnated multifid silky, Stem erect, Branches divided

and Miscellaneous Particulars.

1720 *Tanacetum* An alteration of Athanasia, which see. *Tanaisie*, Fr, *Tansy*, Eng, *Reinfahren*, Ger The common Tansy has a strong aromatic smell, and an extremely bitter taste. It is stimulant and carminative, and its seeds are reckoned anthelmintic and sudorific It is said to drive bugs away from a bed in which it is laid A distilled water and a kind of stomachic bitter are prepared from it The young leaves are shredded down and employed to give color and flavor to puddings, they are also used in omelets and cakes, and those of the curled variety for garnishing



1721. *Artemisia.* Artemis was one of the names of Diana, the goddess of chastity. The plant is said to have been named after this goddess, on account of the purposes to which it was applied in bringing on precocious puberty. Pliny, however, informs us, that in his time, there was an opinion that the plant was named after Artemisia, the Queen of Mausolus, King of Caria.

A Abrotanum, Santonica, maritima, and Absinthium, are included in the Materia Medica, but, according to Dr. Thomson, the latter species is the only one deserving to be retained. It is tonic, antispasmodic, and anthelmintic, and when externally applied, is discutient and antiseptic It has been used with advantage in inter-

History, Use, Propagation, Culture,

mittents, gout, scurvy, and dropsy, and although modern practitioners will scarcely rely on its efficacy in these complaints, yet it is undoubtedly of some value as a stomachic (*London Dispen.* p 182) The seed of wormwood is used by the rectifiers of British spirits, and the species is a good deal cultivated on dry soil near Mitcham, in Surrey, for that purpose A vulgaris is used in some parts of Sweden instead of hops, in order to increase the inebriating quality of malt liquor The plant is readily eaten by cattle and sheep, and is found in our best natural pastures on dry soils It is said to be stomachic and slightly stimulating

The species called Abrotanum, *Garderobe*, Fr, derives its name from α, privative, and βροτος, mortal; on account of the great virtues attributed to it as a preservative of life, Absinthium, from α, privative, and ψυθος, pleasure, i e unpleasant

Dracunculus, *Tarragon*, Eng, *Estragon*, Fr, *Dragon*, Ger, and *Dragoncella*, Ital, is said to have been so called on account of its tortuous roots, which may be likened to the sinuous tail of a dragon, but it is much

11700 Caul. lvs pinnated setac smooth. radic pinnated with 3-fid hoary segm Stem procumb branched virgate
11701 Leaves bipinnatifid downy beneath segm lanceolate blunt, Panic 1-sided, Heads nodding
11702 Cauline leaves pinnated or trifid filiform pubescent, Stem ascending somewhat divided
11703 Cauline leaves pinnated smooth pinnæ filiform remote very long, Heads globose erect sessile
11704 Cauline lvs pinnated smooth lower and radic. 3-partite multifid, Stem panic erect, Peduncles nodding
11705 Cauline lvs pinnated smooth somewhat fleshy pinnæ simple or bifid lin blunt, Heads obl stalked erect
11706 Cauline lvs hoary pinnated linear filiform · floral undivided filiform, Heads roundish angular nodding
11707 Leaves glaucous downy lower pinnated, Pinnæ linear-lanceolate, Heads globose stalked nodding
11708 Leaves multipartite hoary, Racemes erect 1-sided, Heads erect about 5-fl Only one female floret or none
11709 Leaves pilose triply-pinnatifid, Stem simple with a leafless panicle, Heads globose nodding
11710 Leaves simply pinnate with some of the segments bifid subpalmate, Heads erect
11711 Leaves hoary-silky: lower pinnated, Stem nearly erect much branched, Heads sessile ovate
11712 Leaves downy pinnated. the uppermost undivided, Racemes drooping, Recept naked, Flow. obl sessile
11713 Leaves downy pinnate. the uppermost undivided, Racemes drooping, Recept. naked, Flowers obl sessile
11714 Leaves hoary radical bipinnate, Pinnæ close linear blunt of the branches pinnated sessile
11715 Leaves pinnated white with down Fascicles of flowers bracteate, Heads downy
11716 Leaves hoary lower pinnated, pinnæ linear 3-parted, Heads stalked roundish nodding
11717 Leaves snow-white cauline bipinnate linear filiform, floral simple, Heads obl sessile erect
11718 Leaves hoary radical pinnated, pinnæ 3-parted linear-filiform, Heads obl stalked nodding
11719 Leaves subpubescent · cauline pinnated, pinnæ linear acute, Heads globose stalked nodding
11720 Leaves silky · cauline pinnate, pinnæ 3-parted linear runcinate, Heads globose nodding
11721 Leaves silky white, Pinnæ 3-parted linear acute, Heads roundish stalked cernuous
11722 Cauline leaves pinnated or trifid linear, Stem erect panicled, Branchlets nodding 1-sided
11723 Cauline lvs hoary pinnated linear-filiform, Stem ascending branched panicled, Involucre roundish angular
11724 Leaves downy beneath cauline bipinnate, Leaflets linear, Heads roundish stalked nodding
11725 Leaves smooth lower tripinnate, upper bipinnate, Leaflets linear acute, Heads globose stalked nodding
11726 Leaves smooth triply pinnatifid, Stem straight, Heads roundish subsessile erect
11727 Cauline leaves pinnated hoary white pinnæ trifid linear, Stem erect, Involucre hoary, Heads globose
11728 Leaves hoary. lower bipinnate, Pinnæ linear-filiform, Heads oblong sessile
11729 Leaves smooth radic triply pinnate, upper undivided linear, Heads roundish subsessile erect
11730 Lvs bi-tripinnatif clothed with short silky down, Segments lanc. Heads hemispheric droop Recept hairy
11731 Lvs. somewhat hoary caul bipinnatifid, floral trifid or lanc Heads globose stalked nodding, Involucre scarious
11732 Lvs downy lower decompound, upper simple, Panicle corymbose, Heads fascicled ovate hoary
11733 Leaves pinnatifid. their segm cut downy beneath, Heads somewhat racemed ovate, Recept naked
11734 Leaves downy beneath caul pinnatifid, floral undivided linear, Heads sessile obl erect, Involucre smooth
11735 Leaves lanc acuminate downy beneath somewhat toothed, Heads ovate subsessile erect
11736 Leaves smooth lanc acute. cauline trifid at end, Heads roundish stalked nodding
11737 Leaves hoary lanceolate entire radical cut, floral oblong stalked nodding
11738 Lvs smooth lanc narrowed at each end, Heads roundish stalked erect, Scales of involucre membranous at edge
11739 Leaves smooth lanceolate narrowed at each end, Heads roundish stalked erect

11740 Leaves downy beneath scabrous above radical stalked oblong, cauline amplexicaul wavy
11741 Leaves sessile linear smooth above revolute at edge, Heads capitate, Peduncle long
11742 Leaves amplexicaul ovate oblong 3-nerved woolly above, Corymb stalked, Involucre cylindrical
11743 Leaves amplexicaul panduriform spatulate blunt downy, Corymb and branches divaricating
11744 Branches downy, Lvs linear revolute at edge smooth above downy beneath, Leaves of involucre lanceolate acute
11745 Branches pubescent Lvs lanc lin acumin smooth above finely downy beneath, Heads corymb cylindrical
11746 Tomentose, Leaves linear acute curved, Heads in capitate stalked corymbs
11747 Leaves lanc sessile 3-nerved naked above woolly beneath, Corymb contracted-capitate
11748 Leaves amplexicaul spatulate downy acute, Corymb term Branches spreading
11749 Leaves sessile lanc Involucres white lower scales brown
11750 Leaves lin-lanc mucronate revolute at edge downy beneath, Heads sessile capitate terminal
11751 Leaves lanc mucronate revolute at edge downy beneath, Heads corymbose
11752 Leaves obl blunt downy, Corymbs fastigiate, Heads cylindrical
11753 Leaves lin spreading recurved scabrous above, Corymb dense, Involucre cinereous at base
11754 Leaves sessile linear, Outer involucre rough inner flesh-colored
11755 Leaves clustered roundish, Corymbs branched, Involucres downy outside
11756 Leaves linear, Corymb compound, Branches virgate

and Miscellaneous Particulars.

more probable that the word is a corruption of *Tarchon*, the Arabic name of the plant See Tarchonanthus The leaves and points of the shoots are used as an ingredient in pickles. A simple infusion of the plant in vinegar makes a pleasant fish sauce, it is eaten along with beef steaks, as horse-radish is with roast beef, and is employed, both in Europe and Persia, to correct the coldness of salad herbs, and season soups and other compositions The plant is of the easiest culture, but, like other species of the genus, dislikes a wet soil

From the acrid leaves of A chinensis the drug called Moxa is obtained; a substance much in use among the Chinese as an actual cautery For this purpose, the Moxa is laid upon the part affected and set on fire The Cochin Chinese, and also the Japanese, according to Kæmpfer, use Artemisia vulgaris for the same purpose, and it is said with great success, in removing tumours and rheumatic pains, or slight convulsions

1722 *Gnaphalium* A word under which Dioscorides describes a plant with soft white leaves, which served the purpose of cotton It agrees pretty well with the modern genus, which consists of very pretty, sometimes

History, Use, Propagation, Culture,

beautiful woolly leaved shrubs or herbs, all of the description called Everlasting, on account of the permanence of the colors and form of their dry flowers

1723 *Leontopodium* From λεων, a lion, and πους, a foot. The soft tufted silky heads have been compared to the foot of such an animal as a lion

1724. *Evax* A name, the meaning of which has not been explained A little white annual weed.

1725 *Antennaria.* In allusion to the awns of the pappus, which resemble the *antennæ* of some insect. A genus founded upon the Gnaphalium margaritaceum of Linnæus. It consists of herbaceous plants, natives of Europe and North America, having the male and female flowers in distinct involucra, and on different individuals.

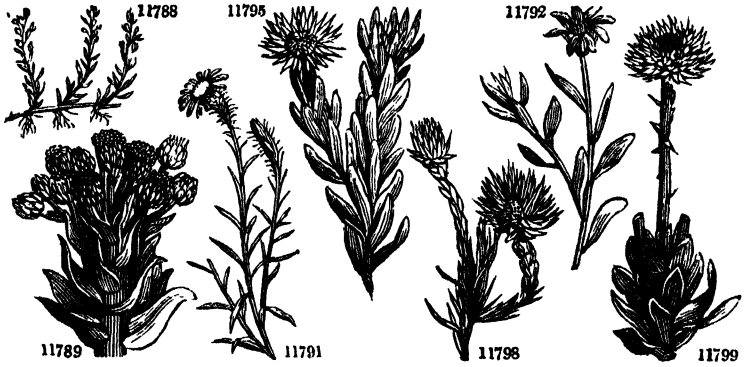
1726. *Metalasia.* Apparently so called from μετα λασσω, to change or alter: but the application of the name is not evident.

11757 Leaves sublanc. downy sessile, Corymbs altern. round, Heads globose
11758 Leaves broad-lanc. somewhat stalked coriaceous downy, Corymb. compound, Stem proliferous
11759 Much branched, Leaves lanc. acutish sessile, Inner scales of involucre yellow
11760 Leaves lanc acute 3-nerved at base wavy pilose: beneath tomentose, Corymb contracted bracteate
11761 Leaves lin. lanc. hoary: radical blunt, cauline acute, Corymb compound, Peduncles long
11762 Leaves lanc. 3-nerved smooth above, Raceme terminal, Stem branched below
11763 Leaves lanc. Corymb decompound, Stem branched below
11764 Leaves hoary downy blunt: radical spatulate lanc., cauline lin.-lanc. Corymb compound
11765 Leaves linear long narrow downy replicate at edge, Corymb compound umbellate
11766 Leaves half amplexicaul linear-lanc subrepand downy on each side: lower blunt, Corymb clustered
11767 White with down, Lvs. lin.-lanc. undivided below, Heads clustered conical
11768 Leaves subspatulate downy naked at end membranous or subulate, Flowers panicled
11769 Leaves decurrent blunt mucronate downy on each side flat
11770 Leaves decurrent lanc. downy flat with a naked point
11771 Leaves white silky-downy linear-lanc acute, Corymb compound
11772 Leaves amplexicaul. entire acute downy beneath, Stem branched
11773 Leaves subamplexicaul lanc Corymbs compound, Scales of involucre plaited
11774 Leaves sessile lingulate very downy, Inner scales of involucre subulate recurved
11775 Leaves lin spatulate downy beneath, Stem erect simple, Heads sessile terminal and axillary
11776 Leaves lin. lanc. Involucre with white lanceolate rays
11777 Stem herbaceous diffuse, Lower scales of involucre subulate naked, Leaves subamplexicaul.

11778 Head terminal enveloped in woolly bracteæ

11779 Stem branched at base, Bractes obovate

11780 Leaves lin mucronulate reflexed, Corymbs few-flowered simple or proliferous, Scales of involucre blunt
11781 Stem erect simple, Lvs ellipt. mucronate amplexicaul. 3-nerved [elongated obtuse colored
11782 Shoots procumb. Stems simp. Corymbs crowded, Rad. lvs spatulate, Fl. dœcious, Inner scales of involucre
11783 Stem simple, Rad. leaves lanc. floral terminal aggregate sessile, Inner scales of involucre long
11784 Runners procumb. Rad lvs ov. nerved, Corymb contracted, Fl dœcious, Inner scales of involucre long blunt
11785 Leaves lin lanc acuminate alternate, Stem branched upwards, Corymb fastigiate
11786 Leaves decurrent lanc acute wavy downy beneath, Stem branched
11787 Leaves lin lanc acutish. smooth above, pubescent beneath, Corymbs terminal contracted



11788 Leaves small fascicled lin subulate downy above, Flowers lateral

11789 Leaves sessile ovate close erect downy, Corymb sessile
11790 Leaves amplexicaul. ovate-oblong 3-nerved acute woolly beneath on each side

11791 The only species

11792 Scales of involucre blunt scariose: the inner ones of the ray lanc blunt spreading
11793 Scales of involucre acute membranous at edge. the inner ones of the ray lanc acute conniving
11794 Scales of involucre roundish scarious: the inner ones of the ray ovate acuminate erect

11795 Leaves sess. lanc. linear woolly acute: floral with a membrane at end, Branches 1-flowered
11796 Leaves sess. lanc. downy keeled spirally imbricated, Branches 1-flowered
11797 Leaves obl.-lanc. silky imbricated, Branches 1-flowered, Peduncles squarrose
11798 Leaves linear subulate erect imbricated, Peduncle scaly 1-flowered
11799 Leaves sessile lanc obovate acute 3-nerved woolly, Branches 1-flowered
11800 Leaves lanc white beneath silky recurved spreading, Branches 1-fl. Peduncles nearly naked
11801 Leaves amplexicaul ovate lanc downy beneath tomentose at edge, Branches 3-flowered

and Miscellaneous Particulars

1727. *Astelma.* From α, privative, and στέμμα, a crown, in allusion to the construction of the fruit. Beautiful Cape shrubs with everlasting flowers.

1728. *Athrixia.* So called by Mr. Ker, we presume from α, without, and θρίξ, hair, in allusion to the absence of hairs upon the receptacle and the stigmas of the ray. A pretty greenhouse shrub, with narrow lanceolate leaves, and bright crimson solitary heads of flowers.

1729. *Xeranthemum.* From ξηρος, dry, and ανθος, a flower, on account of the dry nature of the leaves of the calyx, which retain their color and form for years. The species are popular annual flowers, of easy culture in light rich soil. They are valued for their properties of retaining their texture and color, when gathered and dried, in the manner of Gnaphalium, Elichrysum, and other genera of what are vulgarly called everlastings.

1730. *Elichrysum.* From ήλιος, the sun, and χρυσος, gold, in allusion to the brilliant yellow color of the flowers. The species are much admired for the brilliancy of their flowers even in a dried state. E. bracteatum is the handsomest annual species, and should be raised on a hotbed, and afterwards transplanted into a warm situation.

History, Use, Propagation, Culture,

The woody species require a sandy peat soil, and to be struck in sand on a hotbed, but not covered with a bell-glass, as they are very apt to damp.

1731. *Carpesium.* Named from καρπεσιον, a bit of straw; the long dry leaves of the involucrum resemble straws.

1732. *Baccharis* A name given by the Greeks to an aromatic plant dedicated to Bacchus. The species now

11802 Leaves oblong downy imbricated, Branches 1-headed, Heads nodding
11803 Diffuse proliferous, Leaves roundish ovate smooth convex closely imbricated, Heads sessile
11804 Leaves obl blunt imbricated, Branches 1-fl. Scales of involucre ovate
11805 Leaves obl silky recurved
11806 Decumbent, Leaves lanc. silky somewhat recurved, Branchlets 1-flowered, Peduncles squarrose
11807 Leaves acerose lin keeled smooth appressed, Branches 1-fl Flowers sessile
11808 Lvs. acerose lin roundish downy above · lower spreading, upper appressed, Branches 1-fl Peduncle scaly

11809 Leaves linear lanc channelled amplexicaul · adult smooth, Branches woolly
11810 Branches numerous very fine filiform, Leaves very small 3-cornered imbricated appressed
11811 Leaves obl lanc narrowed at base silky, Peduncles naked 1-flowered terminal
11812 Leaves wavy woolly reflexed at end, Heads small terminal few
11813 Leaves amplexicaul oblong revolute at edge woolly, Flowers terminal solitary shining

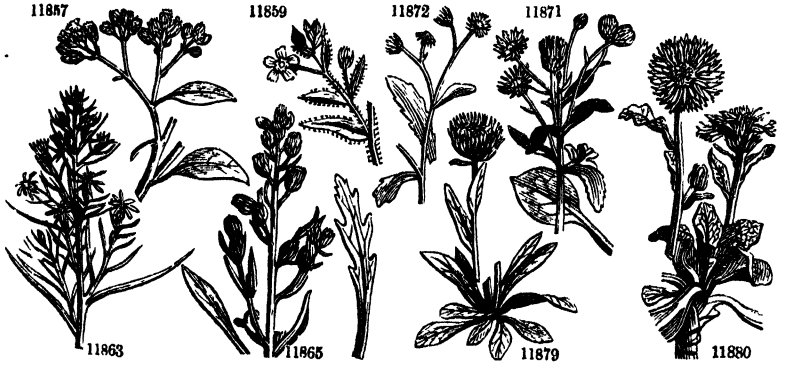
11814 Leaves linear-lanc silky, Corymb simple terminal
11815 Leaves lanc acute at each end roughish, Peduncles 1-flowered long, Involucre bracteate

11816 Heads terminal solitary cernuous
11817 Heads axill subsolitary

11818 Leaves narr linear entire, Panicle compound many-flowered, Involucre small
11819 Leaves lanc. longitudinally toothed serrate
11820 Leaves lanc serrated with one or two teeth forwards
11821 Leaves obovate emarginate crenate forwards
11822 Leaves lanc serrate at end subdecurrent downy beneath
11823 Leaves obl sessile toothed teeth of the base deeper and stipule-like

11824 Leaves lanc 3-nerved tooth-serrated, Corymbs terminal leafy

11825 Lvs pubesc ov-lanc serr the upper ones ent Stem herbaceous corymb Scales of the involucre recurved leafy
11826 Leaves sessile broad-lanc acute serrated, Corymbs terminal fastigiate
11827 Leaves ovate acute at each end toothed stalked pilose, Stem erect branched, Peduncles many-headed
11828 Leaves stalked ovate lanc very acute toothletted, Corymbs term and axillary shorter than leaf
11829 Leaves ellipt serrated villous beneath, Involucre subglobose, Leaves lanc subulate, Branches spreading
11830 Leaves oblong lanc doubly toothed acute downy beneath rugose veined, Petioles toothed
11831 Leaves spatulate oblong amplexicaul serrated rugose
11832 Leaves sess lanc obl lower obovate-obl subserrated at end, Branches corymbose-fastigiate
11833 Leaves ovate stalked entire obtuse downy, Peduncles 1-fl solitary terminal axillary thickened
11834 Leaves lanc ovate reflexed serrated downy beneath, Flowers terminal heaped
11835 Leaves ov stalked crenate blunt downy rugose veiny, Peduncles 1-fl solitary terminal and axillary
11836 Leaves sublyrate cauline entire, Stem downy panicled, Involucre campanulate
11837 Leaves toothed radical smoothish obovate cauline obl downy, Scales of involucre subulate
11838 Leaves oval entire hirsute beneath
11839 Leaves obl spatulate tooth pilose, Heads panicled globose, Leaves of involucre subulate soft
11840 Lvs lanc serrated at end scabrous at edge lower obov. Heads heaped, Lvs of involucre membranous at edge
11841 Stem hairy, Leaves sessile oval blunt denticulate hairy, Panicle terminal contracted
11842 Leaves lin. lanc scabrous nearly entire revolute at edge, Stem panicled, Scales of involucre lax
11843 Leaves lin attenuate at base mucronate, Corymbs stalked contracted terminal
11844 Leaves lin nearly entire, Peduncles long 3-headed
11845 Leaves lin somewhat toothed, Peduncles very long 1-headed
11846 Leaves spatulate somewhat toothed and stem downy, Peduncle long 1-fl
11847 Leaves linear filiform and stems silky with down, Flowers panicled
11848 Leaves cuneiform lin blunt crenate toothletted smooth, Stem shrubby, Anthers with two setæ
11849 Leaves ovate stalked hoary beneath serrated, Corymb terminal compound
11850 Leaves broad lanc. blunt serrulate downy scabrous, Heads clustered surrounded by bractes
11851 Stem branched with spreading hairs, Leaves subamplexicaul blunt coarsely serrated hairy
11852 Leaves ovate entire acute downy beneath, Spikes recurved 1-sided, Bractes reflexed
11853 Leaves ovate subcordate pilose viscid toothed auricled at base, Recept favose
11854 Leaves decurrent ovate mucronate downy lower serrated, Flowers corymbose
11855 Leaves decurrent lin lanc serrulate downy beneath, Spike long terminal interrupted
11856 Stem white with down, Leaves lanc serrulate downy beneath, Heads terminal



and Miscellaneous Particulars.

called B Dioscorides is supposed to have been the Baccharis of the Greeks. An extensive genus of shrubby plants, few of which are deserving of cultivation

1733. *Molina.* Named after John Ignatius Molina, a Spaniard, who published, in 1782, a Natural History of Chili

1734 *Conyza.* This plant was believed to have the property, when suspended in a room, of driving away

History, Use, Propagation, Culture,

gnats and fleas From this imaginary property, its Greek name (from κονωψ, a gnat), its Latin name, *pulicaria*, its English name, *flea-bane*, and its French name, *Herbe aux puces*, are all derived Conyza marilandica gives out a strong smell of camphor

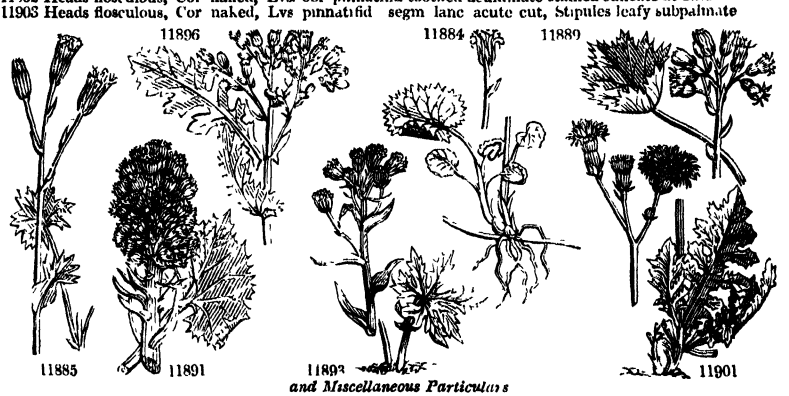
1735. *Madia.* *Madi* is the name of the plant in Chili Clammy weeds, only seen in botanical gardens.

1736 *Erigeron* A name synonymous with *senecio*, which is a translation of it. Named from ἠρ, the spring, and γεραω, an old man, because it becomes old in the beginning of the season. The name Senecio having been applied to another genus, the Greek term is preserved for this, which is related to it. E. viscosum is used to drive away fleas and gnats, probably from its strong scent, or, as some suppose, from the clammy juice of the leaves and stalks, hence the old name of Flea-bane, or Flea-wort

1737 *Tussilago.* From *tussis*, a cough, for curing which the flowers are frequently employed at this day. Farfarus is the name under which the Greeks designated the White Poplar, the leaves of which are like the modern T. Farfara.

T. Farfara is a certain indication of a clayey soil, and, according to Dr Withering, is the first plant which vegetates in marle or lime stone rubble The clayey part of the pestilential Maremmes of Tuscany, where scarcely any other plant will grow, is covered with common colts foot. The cotton of the leaves wrapped in a rag,

11857 Leaves ovate-lanc entire hoary downy beneath, Corymb compound terminal
11858 Leaves decurrent ellipt. crenate downy beneath, Heads capitate



11859 Leaves lanc sessile viscid, Outer involucres 10-leaved
11860 Leaves amplexicaul. lanc viscid

11861 Leaves sublinear entire, Branches lateral many-flowered
11862 Nearly stemless, Rad leaves on long stalks triply 3-parted, cauline linear undivided
11863 Stem panicled, Flowers subsolitary terminal, Leaves linear entire
11864 Stem and flowers panicled hairy, Leaves lanc. ciliated
11865 Lower leaves lanc lacinate cauline linear, Heads racemose
11866 Leaves scabrous · lower lanc toothed in middle, upper linear, Heads corymbose
11867 Stem many-fl Lvs. lanc. subserrate cauline half amplexicaul. Florets of ray capillary the length of disk
11868 Radical leaves oval-lanc acute somewhat toothed, Stem nearly leafless simple long
11869 Stem many-fl pilose, Leaves obl somew toothed amplexicaul Florets of ray capillary longer than disk
11870 Rad. leaves obovate serrated cauline lanc entire, Stem about 2-fl Ray longer than disk
11871 Rad. leaves roundish ovate deeply toothed stalked cauline lanc toothed subserrated in middle
11872 Stem few-fl subvillous, Leaves cuneiform lanc Serratures 2 on each side
11873 Branches spiked, Scales of involucre long, Peduncles scaly, Leaves very long smooth sessile
11874 Leaves entire bluntly mucronate. radical oblong stalked, cauline cordate ovate sessile
11875 Stem nearly naked, Rad leaves spatulate smooth dotted: cauline linear, Heads corymbose
11876 Leaves lanc 3-nerved scabrous somewhat toothed sessile, Stem panicled, Ray shorter than disk
11877 Pedunc. alternate (scarcely racemose) single-fl Pappus as long as the florets of the ray, Lvs lanc obtuse
11878 Stems with usually only one fl Pappus much shorter than the florets of the ray, Lvs lanceolate
11879 Stem 1-flowered, Involucre pilose
11880 Leaves ciliated glaucous clammy radical with winged stalks and few teeth, cauline sessile entire
11881 Leaves pinnatifid, segments of the cauline leaves linear entire, of the radical lanc somewhat toothed

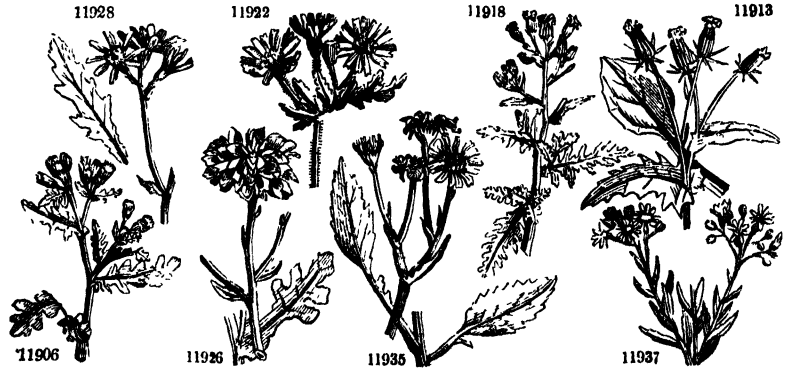
11882 Scape 1-fl naked, Head radiated nodding, Lvs stalked obovate toothed sinuated at base downy beneath
11883 Scape 1-fl nearly naked, Head discoid, Lvs reniform toothed smooth
11884 Scape 1-fl nearly naked, Head discoid, Lvs reniform toothed downy beneath
11885 Scape about 1-fl nearly naked, Head discoid, Lvs smooth reniform slightly 7-lobed
11886 Scape single-fl imbricated with scales, Lvs cordate angular toothed downy beneath
11887 Thyrsus fastigiate, Heads radiant, Lvs roundish cordate unequally toothed downy beneath
11888 Thyrsus fastigiate, Heads radiant, Lvs roundish cordate equally toothed downy beneath
11889 Thyrsus fastigiate, Heads discoid, Lvs orbicular cordate doubly and finely toothed
11890 Thyrsus oblong, Heads discoid, Lvs obl cordate unequally toothed white beneath lobes spreading
11891 Thyrsus ovate-oblong, Lvs cordate unequally toothed with the lobes approximate downy beneath

11892 Thyrsus oblong, Heads discoid, Lvs obl cordate unequally toothletted snow-white beneath
11893 Thyrsus fastigiate, Heads obsoletely radiant, Lvs roundish cordate half 7-lobed downy beneath

11894 Heads flosculous, Cor naked, Involucre ventricose somewhat imbricated, Lvs filiform lin entire smooth
11895 Heads flosculous, Cor. naked, Lvs obl amplexicaul unequally and deeply toothed, Stem virgate
11896 Heads flosculous, Cor naked, Lvs lyrate hairy upper lanc toothed
11897 Heads flosculous, Cor naked, Lvs ellipt. tooth-serrated hairy, Peduncles long many-flowered
11898 Heads flosculous, Cor naked, Lvs lyrate pilose on each side viscid
11899 Heads flosculous, Cor naked, Lvs lanc toothed scabrous, Flowering branches spreading
11900 Heads flosculous, Cor. naked, Lvs obl lanc finely serrated smooth, Heads corymbose
11901 Heads flosculous, Cor naked, Lvs lyrate pinnatifid toothed, Scape nearly naked
11902 Heads flosculous, Cor naked, Lvs. obl pinnatifid toothed acuminate stalked cuneate at base
11903 Heads flosculous, Cor naked, Lvs pinnatifid segm lanc acute cut, Stipules leafy subpalmate

and Miscellaneous Particulars

dipped in a solution of saltpetre, and dried in the sun, makes an excellent tinder The leaves are the basis of the British herb tobacco, they have been regarded as expectorant from the earliest ages, having been smoked through a reed in the days of Dioscorides, with the view of relieving the chest from accumulated mucus in catarrh, asthma, and phthisis. At present, though it occupies a place in the Materia Medica, very little reliance is placed on its powers (*London Disp* p 542.)



T. Petasites, from the Greek πέτασος, a broad covering, in allusion to the leaves, which are larger than those of any British plant, and affbrd shelter from rain to poultry and other small animals It is called Butter bur, in allusion to a former application, and Pestilent-wort, from its supposed efficacy in the plague T. hybrida is by some considered, a variety of this species, as T. alba is of T paradoxa T fragrans is valued in gardens as an early and fragrant flower; like all the species, it is apt to run very much, and is therefore best kept in pots.

It is remarkable that no plant belonging to the tribe of Tussilagineæ, has been discovered with hermaphrodite flowers They are distinguished from other tribes by their stigma, which occupies both surfaces of the lobes of the style. They are nearly all natives of Europe

1738. *Senecio*. For the explanation of this word, see Erigeron. Most of these species are annual weeds, or

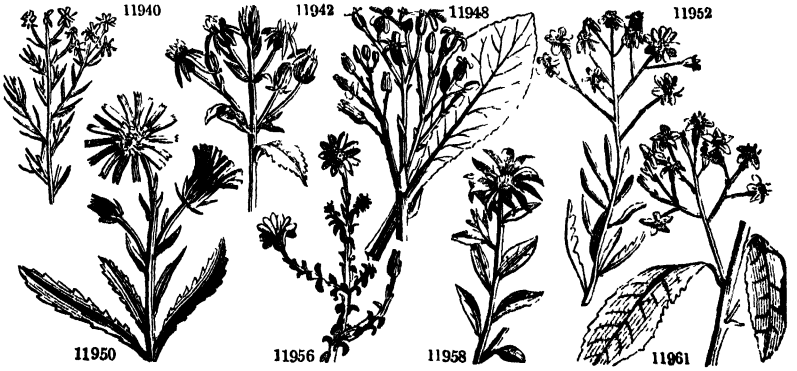
History, Use, Propagation, Culture,

rude gigantic yellow flowered autumnal perennials, S. venustus and cinerascens, however, are elegant plants with purple flowers. Of S elegans there is a double flowered variety, common in green houses, and readily propagated by cuttings.

Senecio hieracifolius is the pest of newly cleared ground in North America, as S. vulgaris is in Europe. It is known by the name of the Fire-weed.



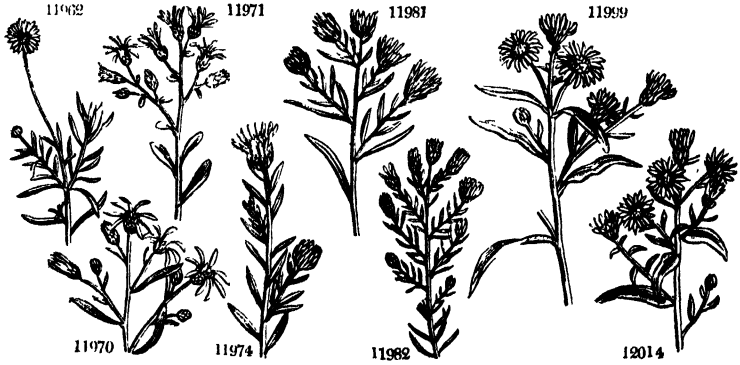
Senecio vulgaris is esteemed emollient and resolvative It is employed in spitting of blood, in the form of a poultice, and against the gout and hæmorrhoids. It is given to horses suspected to be troubled with worms.

11904 Herb downy upwards, Lvs. sinuate toothed and pinnatifid, Heads clustered, Involucre cylindrical
11905 Herb hirsute, Lvs broad-lanc. sinuate-toothed and toothletted teeth callous at end, Heads panicled
11906 Leaves semiamplexicaul pinnatifid toothed, Heads in clustered corymbs destitute of a ray
11907 Heads flosculous, Cor naked, Leaves subbipinnate stalked smooth, Involucre not withered
11908 Heads radiant, Leaves half-amplexic. pinnatifid, Segments linear acute toothed distant, Peduncles long
11909 Heads flosculous, Cor. naked, Leaves obovate stalked cut-toothed, Pedunc filiform 3-headed
11910 Heads radiate, Ray revolute, Leaves stalked obl. sinuate, Peduncle 3-headed, Involucre conical
11911 Heads radiate, Ray revolute, Leaves amplexic lin lanc. pinnatifid, Scales of involucre sphacelate in part
11912 Heads radiate, Ray revolute, Leaves amplexicaul. lanceolate-linear fleshy bluntly sinuated
11913 Heads radiate, Ray revolute, Leaves amplexicaul. lanceolate toothed, Scales of involucre all unwithered
11914 Heads radiate, Ray revolute, Leaves amplexicaul obovate 3-lobed at end serrated
11915 Heads radiate, Ray revolute, Leaves pinnatifid downy revolute at edge, Panicle spreading
11916 Leaves amplexicaul cut toothed scabrous above downy beneath, Heads racemose
11917 Ray revolute, Leaves pinnatifid and viscid, Scales of the involucre lax hairy
11918 Ray revolute, Lvs sess pinnatifid lobed and toothed, Scales of involucre very short glab Stem erect straight
11919 Ray revolute, Leaves lyrate sinuate blunt stalked, Stem hirsute [corymbose
11920 Ray revolute, Leaves amplexicaul lanceolate blunt toothed entire
11921 Heads radiate, Petiole amplexicaul Peduncles 3 times as long as pinnate sinuated leaves
11922 Heads radiate, Leaves amplexicaul pinnatifid hirsute crisp-toothed, Stem woolly
11923 Cor radiant, Leaves pinnated multifid · segm filiform smooth, Heads corymbose
11924 Cor radiant, Lvs amplexic. pinnatifid glabrous above segm angular toothed, Stem and involucre glabrous
11925 Cor radiant, Stem involucre and leaves glabrous, Leaves pinnatifid segm linear acute toothed
11926 Cor. radiant, Leaves pilose viscid pinnatifid equal spreading, Rachis narrowed below

11927 Cor radiant, Leaves half-amplexicaul pinnatifid segm linear subdentate distant
11928 Cor. radiant, Stem simple nearly naked, Radical leaves stalked oblong toothed ciliated
11929 Cor radiant, Leaves pinnatifid toothed somewhat hairy, Stem erect
11930 Cor radiant, Leaves tomentose oblong toothed, Stem leafy 1-flowered
11931 Cor rad Lvs toment on each side snow-white pinnatif. segm lin blunt somew tooth. Corymb contracted
11932 Cor radiant, Leaves pinnate multifid linear naked acute, Peduncles about 2-flowered
11933 Cor radiant, Leaves pinnate: pinnæ lin -subulate somewhat cut downy beneath, Stem somewhat hairy
11934 Ray spreading, Leaves lyrate bipinnatifid divaric toothed glabrous, Stem erect, Pericarps hairy
11935 Ray spreading, Florets elliptical, Leaves lyrate serrated · lower obovate entire, Pericarps glabrous
11936 Cor. radiant, Rad lvs. ovate-cordate serrated stalked cauline pinnatifid toothed, Peduncles thickened
11937 Cor radiant, Lvs lanc lin nearly entire smoothish, Corymb contracted terminal stalked
11938 Cor radiant, Lvs. lanc lin toothed rigid scabrous, Corymbs terminal and axillary stalked
11939 Cor radiant, Lvs lanc lin subtomentose glaucous finely toothletted or entire, Corymb contracted terminal
11940 Cor radiant, Leaves linear entire, Corymb squamose, Stem herbaceous
11941 Cor radiant, Lvs half amplexicaul lanc finely serrate subvillous beneath, Corymb terminal spreading
11942 Cor radiant, Lvs ovate lanc serrated ciliated at edge sessile unequal at base
11943 Ray spreading, Lvs. lanc sharply serrated nearly glabrous, Corymbs of rather few flowers
11944 Cor radiant, Lvs ovate-lanc finely serrated smooth on each side subsessile
11945 Cor radiant, Outer scales of involucre subulate spreading, Lvs subdecurrent obl lanc villous
11946 Cor radiant, Lvs sess. obovate toothed at end glaucous: younger silky, Corymb compound terminal
11947 Cor radiant, Lvs toothed lower ovate decurrent in the stalk upper cordate obl amplexicaul
11948 Cor radiant, Scales of involucre appressed, Lvs subdecurrent villous beneath lanc. serrated
11949 Cor radiant, Outer scales of involucre spreading, Lvs subdecurrent obl lanc glauc serrate
11950 Cor radiant, Stem undivided about 1-fl Lvs undivided serrated radical ovate villous beneath
11951 Cor radiant, Lvs. lanc. cordate at base amplexicaul smooth finely serrated
11952 Cor radiant, Lvs lin. scattered
11953 Cor. radiant, Lvs obovate fleshy somewhat toothed
11954 Cor radiant, Lvs obl sessile toothed downy beneath upper amplexicaul. toothed only at base
11955 Cor radiant, Lvs amplexicaul spatulate repand eroded scabrous

§ 1 *Shrubby*

11956 Leaves ovate subimbricated recurved serrate-ciliated, Heads terminal
11957 Leaves ovate serrate spreading downy beneath, Heads terminal about 3
11958 Leaves obl lanc sessile entire 3-nerved silky with down, Flowers terminal
11959 Leaves stalked roundish ovate hairy with 1 or 2 teeth on each side, Peduncles 1-headed long terminal
11960 Stem fluted, Leaves alternate stalked lanc blistered repand-toothed downy beneath, Flowers panicled
11961 Leaves ovate lanc. toothed silky beneath, Panicles compound axillary, Rays 3



and Miscellaneous Particulars

The tribe of Senecioneæ is nearly related to Anthemideæ, and a portion of Inuleæ, from which the differences in the style are insufficient to distinguish them. They appear, however, to be sufficiently well characterized by their other floral organs They are found in every part of the world, especially in the south of Africa. *Humboldt has observed*, that they are very numerous in the upper region of the Andes, just below the limits of eternal snow, where the sun has little influence, where hurricanes are incessant, and not a tree is able to rear its head.

1739. *Aster*. The flowers of all the species of Aster resemble little stars, on account of the numerous rays

History, Use, Propagation, Culture,

of their circumference. A very numerous genus of plants, commonly called in England, Christmas Daisies, in allusion to the late period of the year at which they blossom They are not very ornamental, and yet their flowers are acceptable at a season when few others are to be seen in open air. The species are extremely

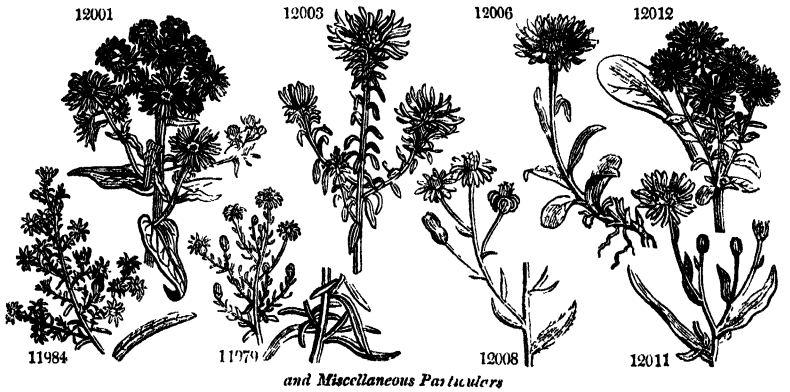
11962 Leaves linear acute not dotted somewhat hoary, Pedunc term solitary 1-fl long
11963 Leaves linear filiform obtuse hairy, Invol imbricated
11964 Leaves linear fleshy smooth dotted blunt, Pedunc 1-headed, Invol. imbricated shorter than disk
11965 Leaves linear blunt glabrous dotted, Pedunc. 1-headed long, Invol imbricated as long as disk
11966 Leaves linear filiform fasicled smooth dotted, Ligules entire
11967 Leaves linear scattered revolute at edge prickly above, downy beneath, Heads in racemose panicles
11968 Stem and leaves rough, Leaves dense linear reflexed, Flowering branches short racemose
11969 Leaves obl narrowed at each end sess Stem somew climbing, Branches downy, Scales of invol squarrose

§ 2. *Herbaceous*

* *Leaves entire*

11970 Leaves lin lanc 3-nerved dotted acute scabr at edge, Ray about 5-fl. Invol imbric twice as short as disk
11971 Lvs lin lanc obsol 3-nerv blunt scab at edge, Hds in sess. clust Ray about 5-fl Inv imbr short. than disk
11972 Lvs cuneate obov acute nervel scab on each side twisted spread Inv cylindr imbr with 2 bractes at base
11973 Lvs lin lanc narr at base nerveless roughish revolute at edge, Inv lax imbr Branches filiform 1-headed

11974 Lvs lin mucro somew keeled rigid scabrous at edge cauline reflexed, of the branches much spreading
11975 Lvs many lin mucron. nerveless not dotted keeled scabrous rigid, Branches fastigiate 1-headed
11976 Lvs narrow lin nerveless not dotted smooth erect, Branchlets term nearly naked 1-headed
11977 Lvs lin nerveless dotted scabr reflexed spreading, Branches corymb fastigiate leafy, Invol imbr short
11978 Lvs. lin lanc hoary, Stem branched villous, Branchlets somew 1-sided 1-headed, Invol obl lax imbricated
11979 Lvs lin lanc narrowed at each end acum Stem downy paniced erect, Branches few-headed, Inv imbr
11980 Very smth with small fl Stem panicled, Branch many-head Lvs lin subulate, Invol cylindr Ray minute
11981 Lvs. lin lanc narrow both ways hispid at edge, Stem smth. branched erect, Branches 1-headed, Inv imbr
11982 Lvs lin glabrous · those of the branches very short, Branches panicled, Invol cylindr closely imbricated
11983 Lvs lin glab those of the branches subul close together, of the stem long Invol subsquarr Leafl acute
11984 Lvs lin glab. Stem much branched diffuse downy, Branchlets 1-sided, Inv imbr scales obl squarr acute
11985 Lvs ciliat · caul lin lanc nerv those of the br very short lanc 3-nerv Stem branch downy, Br panic
11986 Hoary, Lvs lin Panic corymb much branched leafy, Invol imbr very acute longer than disk [at base
11987 Lvs remote lin amplexicaul erect very smth scabr at edge, Pedunc almost naked, Inv squarr with 2 lvs
11988 Very smth Lvs subul lin somew fleshy subreflex Stem slender much branch Branchl setaceous 1-head
11989 Lvs very numerous lin. blunt reflexed hispid at edge, Stem branch diffuse smooth, Branches 1-headed
11990 Dwarf with creeping roots, Stems weak simple, Lvs long lanc smoothish, Invol with lin obl blunt scales
11991 Lvs very numerous ovate-acum reflexed hispid at hedge, Stem branched hairy, Branches 1-headed
11992 Lvs obl lanc silky sess Stem slender decumbent loosely branched, Branchlets and branchlets 1-headed
11993 Lvs obl lanc hoary on each side, Stem simple erect downy, Raceme terminal
11994 Cauline leaves amplexicaul scabrous of the branches small, Invol imbricated scales length of disk
11995 Hoary all over, Lvs lanc obl acute at each end sess revolute at end netted and 3-nerved beneath
11996 Smooth, Lvs obl ovate acuminate shortly stalked scabrous at edge, Panicles few-headed, Stem smooth
11997 Lvs subrhomboid oval-lanc acuminate at each end somew stalked glabr hispid at edge, Corymb diverging
11998 Lvs lanc narrowed at base acuminate scabrous at edge, Stem simple corymb at end, Invol loosely imbr



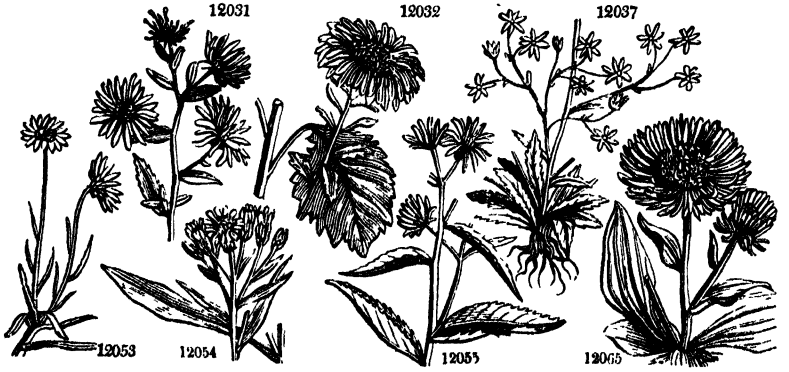
11999 Lvs lin lanc nearly entire smth Stem smth paniced at end, Invol l inc imbr. Scales acute spread at end
12000 Lvs lanc somewhat amplexical narrowed at end scabrous at edge, Stem erect hispid, Branchlets pilose
12001 Lvs lin lanc pilose amplexicaul auricled at base, Stem simple pilose straight, Heads sess term clustered

12002 Lvs lin lanc. amplexicaul polished, Stem virgate panicl Branches racemose, Inner scales of invol colored

12003 Lvs lin rigid acute subamplexicaul those of the branches reflexed hispid at edge, Scales of invol squarr
12004 Lvs lanc cordate amplexicaul downy beneath, Stem quite simple downy, Pan. term. lax few-headed
12005 Lvs obl lanc ciliate cordate amplexicaul scabrous on each side hairy, Stem branched hairy
12006 Stem 1-fl Rad lvs lanc spatulate cauline lanc Scales of invol nearly equal lanc bluntish
12007 Stem 1-fl Rad lvs spatulate cauline lin -lanc Scales of invol nearly equal linear acuminate
12008 Lvs. lin remote 3-nerved acuminate dotted scabrous at edge, Branches corymb fastigiate, Ray 10-fl
12009 Lvs lin lanc glabrous not dotted 3-nerved, Invol imbricated twice as short as disk
12010 Lvs lin lanc 3-nerved hoary on each side, Invol twice as short as disk imbricated
12011 Lvs lin lanc hispid at edge, Stem simple corymbose, Scales of invol lanc. blunt equal
12012 Lvs obl lanc scabrous, Invol imbr subsquarrose lvs blunt, inner membranous colored at edge
12013 Lvs lin lanc sessile scabrous at edge, Stem panicled smooth, Invol lax imbricated
12014 Lvs lin lanc rarely toothed long smooth, Heads terminal, Invol squarrose

** *Leaves lanceolate and ovate lower serrate.*

12015 Lvs ov-obl acute amplexicaul cordate serrated smooth, Stem panicled smooth, Branches 1-2-headed
12016 Lvs amplexicaul spatulate lanc acuminate serrated in middle cordate at base, Branches pilose
12017 Lvs amplexic lanc lower subserr smooth, of the branches lin squarr. Invol squarr shorter than disk
12018 Lvs subamplexicaul broad-lanc subserrate smooth, Stem glabrous, Branches many-headed



and Miscellaneous Particulars

difficult to distinguish the most ornamental are A punceus, Novæ Angliæ, pulchellus, and macrophyllus A chinensis is a well known border annual, of which there are varieties of different colors, and semi double, and double It is raised on a hotbed, and transplanted into the open ground in April or May

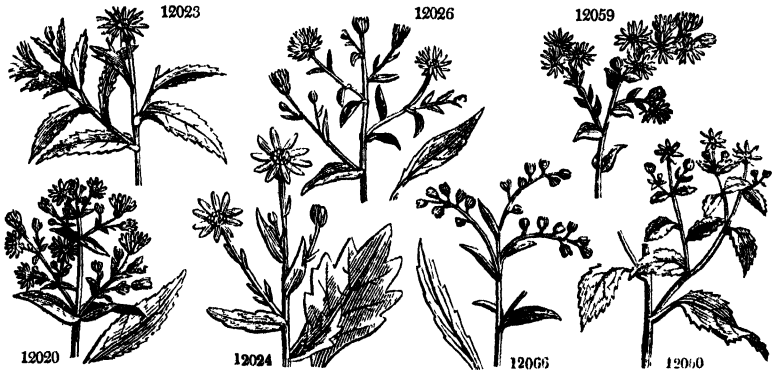
History, Use, Propagation, Culture,

Asteræ are chiefly characterized by their style, which, in its most complete state, is alone sufficient to distinguish them from every other tribe They are found in every part of the world, but especially in North America and Africa.

1740. ***Solidago*** From *solidari*, to unite, on account of the vulnerary qualities of the plants. The species are all autumnal coarse-looking herbaceous plants with yellow flowers, in the shrubbery they make a pretty

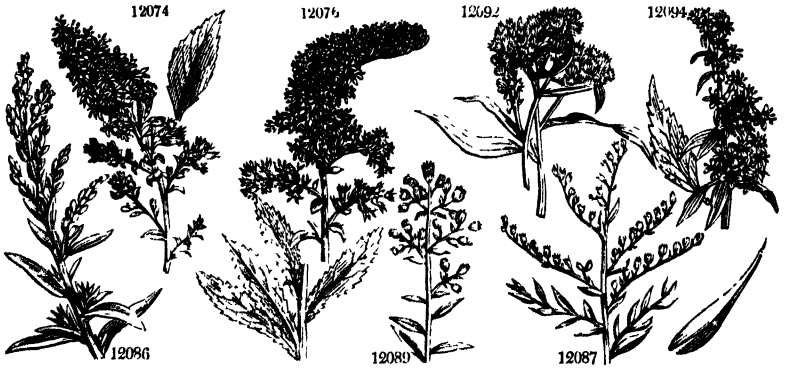


12019 Lvs. subamplexicaul broad-lanc subserrate smooth, Stem glabrous, Scales of involucr shorter than disk
12020 Lvs. subamplexic. : upper lanc acumi entire; lower lanc narrowed at base serrated, Branchlets virgate
12021 Lvs subamplexicaul remote obl entire lucid · radic. subserrated, Involucr imbr with cuneiform leaflets
12022 Lvs. subamplexicaul lanc lower subserrate smooth, Stem simple paniclcd at end, Involucr closely imbricated
12023 Lvs amplexicaul. lanc. serrate roughish, Branches panicled, Involucr lax longer than disk
12024 Lvs. obl lanc. scabrous ciliated lower ovate, Stem hispid, Branches 1-headed, Scales of involucr obl imbr
12025 Lvs subamplexicaul. lanc lower serrated, Stem smooth, Branches corymbose
12026 Lvs. subamplexicaul lanc glabrous scabrous at edge: lower subserrated, Branches divided
12027 Lvs amplexicaul narr lanc scabr. above lower subserr. Stem much branched, Involucr with spread scales
12028 Lvs lanc roughish somewhat amplexicaul. lower serrate in the middle, Scales of involucr lax leafy
12029 Lvs obl lanc. acuminate sessile smooth scabrous at edge lower serrated, Branches corymbose smooth
12030 Lvs sessile serrated smooth spatulate lanc narrowed at base and bent down towards each side
12031 Lvs subamplexic. obl lanc acuminate serrated smooth, Stem pyramidal, Racemes scarcely longer than lvs
12032 Lvs ov coarsely toothed stalked cauline sessile cuneate at base, Stem hispid, Branches with single heads
12033 Lvs broad lanc narrow at base entire with a very long point, Stem simp. flexuose angul Panic corymb
12034 Lvs obl. 3-nerved narrowed at base acute upper sess nearly entire, lower stalked serrated, Stem corymb
12035 Lvs lanc serrate acuminate rugose very rough, Stem erect angular simple
12036 Lvs. sess narrow lanc serrated scabrous, Stem 1 or few-headed
12037 Lvs lanc sess serr smooth, Branches virgate, Involucr imbricated, Stem round smooth
12038 Lvs sess narrow lanc : lower serrated in middle, Stem branched smooth recurved, Involucr lax imbricated
12039 Lvs lin lanc acumn scabrous at edge lower subserrated, Stem panicled, Branches 1-headed
12040 Lvs lin lanc acumn scabrous at edge lower subserrated, cauline reflexed, Stem lax panicled
12041 Lvs lanc acum scabrous at edge cauline serrated at end, those of the branches entire, Stem panicled
12042 Lvs lin entire radic obl subserrated, Stem much branched downy, Involucr loosely imbricated
12043 Lvs lanc lin sessile smooth lower subserrate, Stem panicled smooth, Involucr imbricated
12044 Lvs lin lanc sessile entire smooth lower lanc subserrate, Stem branched diffuse smoothish
12045 Lvs lin acuminate entire lower lin lanc subserrate, Branches corymbose, Involucr imbricated
12046 Lvs lin acuminate entire: radical obl serr Branches in corymbose panicles, Involucr imbricated
12047 Lvs sess lanc serrated smooth, Involucr imbricated leaflets acute, Stem rather villous
12048 Lvs ellipt-lanc serrated smooth cauline lan-lanc long, Branches spreading, Involucr imbr Stem pubesc
12049 Lvs ellipt-lanc serrated smooth even-sized, Branches spreading, Involucr imbricated, Stem pubescent
12050 Lvs ellipt-lanc serr. smooth those of the branches distant, Branches much spreading pendulous
12051 Stem 1-fl Lvs ovate sessile scabrous, Scales of involucr nearly equal linear
12052 Lvs lin lanc entire blunt mucronate 3-nerved at base veiny, Stem simple corymbose downy
12053 Lvs filiform aculeate ciliate, Involucr hemispherical, Leaflets equal
12054 Stem glabr corymb Lvs lin-lanc fleshy obscurely 3-nerv Scales of involucr lanc membran obt imbricated
12055 Leaves lanc subamplexicaul serrate pilose scabrous, Involucr lax leafl lanc acuminate tobaccous hispid
12056 Leaves scabr caul obl lanc acute, radical obl stalked, Scales of involucr obl cuneate blunt subsquarrose
12057 Leaves sessile obl lanc serrate floral ciliated, Stem branched glabrous, Involucr closely imbricated
12058 Lvs obl lanc serrat narrow at base, Stem hairy, Involucr imbric nearly equal, Outer scales somew spreading

**** Leaves cordate and ovate, serrate*

12059 Leaves obl cordate amplexicaul entire, Petioles winged, Stem panicled hispid, Branchlets 1-sided
12060 Leaves ovate-lanc subserrated stalked smooth, Petioles naked, Stem much branched smooth, Involucr lax
12061 Leaves cordate pilose beneath finely serrated stalked, Stem panicled smoothish, Panicle spreading
12062 Leaves ov finely serrated acum smoothish lower cord stalked, Branches hairy, Scales of involucr blunt
12063 Leaves ovate stalked serrated scabrous upper ovate cordate sessile, Stem branched diffuse, Scales acute
12064 Leaves smooth cauline ovate subcord acuminate deeply serrated entire at end, Stem panicled smooth
12065 Leaves ovate narrowed at base entire about 5-nerved, Involucr lax squarrose, Ray very fine

§ 1 Racemes 1-sided, Leaves 3-nerved [exceeding disk



12066 Stem downy, Lvs lanc serrat triple-ribb rough, Clusters copious panicl unilateral recurv Radius hardly
12067 Leaves obl 3-nerved subserrated, Racemes 1-sided, Ligulæ middling, Stem smooth, Peduncles downy
12068 Stem villous erect, Lvs lanc serrated triple-ribbed rough villous beneath, Clusters spiked erect drooping before flowering, Radius short
12069 Stem erect round very smooth, Leaves lin-lanceol smooth triple-ribbed serrated rough-edged, Clusters panicled unilateral, Stalks downy
12070 Stem erect smooth, Lvs. lanc smooth serrated rough edged obscurely triple-ribbed, Clusters paniculated unilateral, Stalks hairy, Radius short
12071 Stem erect smooth, Leaves lanc. somewhat triple-ribbed smooth rough-edged slightly serrated, Clusters panicled unilateral, Stalks smooth, Bract fringed, Radius short
12072 Stem erect villous, Lvs lanc somew serrat. triple-ribbed rough reflexed, Clusters panicled slightly unilateral
12073 Stem erect rather hairy, Lvs lanc obscurely triple-ribbed smooth rough edged the lower ones slightly serrated, Clusters panicled unilateral somewhat recurved

and Miscellaneous Particulars

appearance among other coarse things, but there is not one of them which is worth a place in a choice collection of ornamental plants The leaves of the Solidago odora have a delightfully fragrant odor, partaking of that of anise and Sassafras, but different from either When subjected to distillation, a volatile oil, possessing the taste and aroma of the plant in a high degree, collects in the receiver This oil apparently has its residence in the transparent cells which constitute the dotting of the leaves The effects of the S odora are

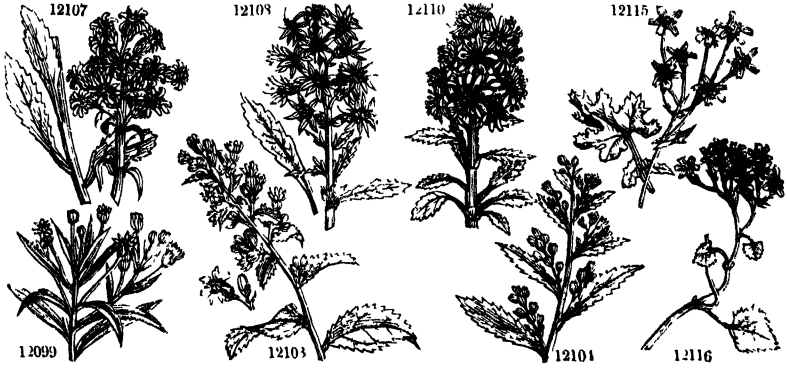
History, Use, Propagation, Culture,

aromatic, pleasant to the taste, gently stimulant, diaphoretic, and carminative. An essence made by dissolving the essential oil in proof spirit, is used in the eastern states as a remedy in complaints arising from flatulence, and as a vehicle for unpleasant medicines of various kinds. It has been employed successfully to allay vomit-

§ 2. *Racemes 1-sided. Leaves not 3-nerved.*



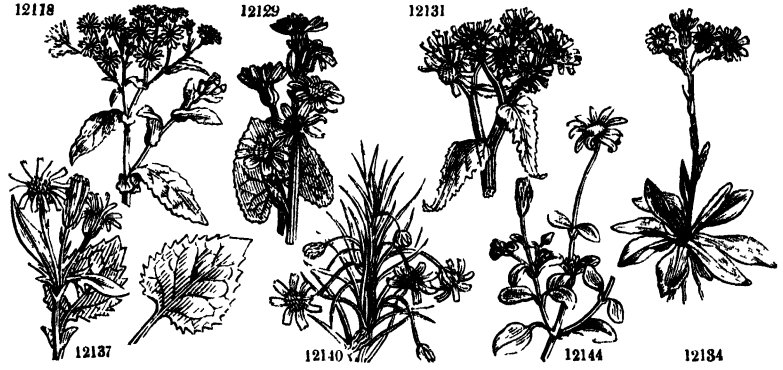
12074 Stem erect round hairy, Lvs. ov rather ellipt. very rough rugged serrated without lateral ribs, Clusters panicled unilateral
12075 Stem erect hairy, Lvs lanc the lower ones deeply serrated very rough rugose, Panicles unilateral
12076 Stem erect hairy, Lvs. ovate-lanc. the lower ones closely serrated rugged very rough, Clusters panicled compound widely spreading unilateral
12077 Stem erect vill. Lvs lanc rather soft serrated without lateral ribs, Clusters panicled unilateral
12078 Stem erect hairy, Lvs. oblong pointed smooth above rugged and rough beneath, Clusters unilateral
12079 Stem erect downy, Stem lvs lanc hisp ent radic ones somew. wedge-shap serrat. Clust. panic unilateral
12080 Stem erect smooth angular, Lvs. ellipt serrated smooth the radic. ones obl.-spatulate, Clusters panicled unilateral spreading, Pedunc downy
12081 Stem erect striated smooth, Lvs ellipt pointed deeply serrated vill. beneath: radical ones obovate, Clusters panicled unilateral, Pedunc villous, Rays short
12082 Stem erect smooth, Lvs smooth sharply and unequally serr.: those of the stem ellipt., radical ones ovate-obl Clusters panicled unilateral, Rays elongate
12083 Stem erect smooth, Lvs. lanc. smooth rough-edged · the lower ones serrated, Clusters panicled unilateral
12084 Stem erect smooth, Lvs ellipt smooth serrated, Clusters panicled unilateral, Rays of a middling length
12085 Stem erect downy, Lvs. lanc serrated rough edged, Clusters elongated unilateral recurved panicled
12086 Stem erect smth Lvs lin.-lanc rather fleshy smth entire rough-edg Clust. panic. unilateral, Ped. roughish
12087 Stem erect striated downy, Lvs lin.-lanc entire smooth rough-edged, Clust. panic. unilateral nearly simple

§ 3 *Racemes erect*

12088 Smooth somewhat shrubby, Lvs lanc obtuse without ribs, Panicle compound many-fl tuft of flowers erect, Involl narr.-oblong with 5 flor in the disk and 1 in the radius
12089 Stem hairy, Lvs ellipt hairy the lower ones serr, those on the fl.-branches entire numerous and small, Clusters erect, Scales of involl obtuse
12090 Stem erect villous, Lvs ellipt roughish stalked, Clusters erect, Rays twice the length of the involl
12091 Stem erect smth Stem-lvs lanc entire smth rough-edg radic ones serrat Clust panic erect, Ped. smth.
12092 Stem smooth furrowed much branched, Lvs almost lin ent roughish nearly erect with 3 or 5 rough ribs, Rays not longer than the disk
12093 Stem rough angular branch corymb Lvs spread lin very narr slightly 3-ribb rough with axilla tufts of smaller ones, Rays scarcely exceeding the disk
12094 Stem nearly erect very smooth and even, Lvs lanc smooth with roughish edges and ribs, Clusters erect, Rays rather longer than the disk
12095 Stem smooth panic Lvs lanc serrat smth rough-edged, Branches racemose at the extremity, Rays elong
12096 Stem panic hairy, Lvs lanc rough on both sides those of the stem serrat, of the branches ent. Clusters erect, Rays elongated
12097 Stem branch downy, Lvs lanc rough on both sides tapering 3-ribb entire, Clusters erect, Rays elongated
12098 Stem erect smth Lvs lanc fleshy entire smooth in every part, Clusters panic erect, Pedunc scaly hairy, Radius twice the length of involl
12099 Stem oblique smooth, Lvs lanc somew fleshy entire smooth in every part, Clusters panic erect, Pedunc scaly smooth, Rays longer than involl
12100 Stem erect slightly downy, Lvs lin lanc smooth rough-edged tapering at the base: the lower ones somew serrated, Clusters erect, Rays elongated
12101 Stem rather vill Lvs lanc veiny smooth entire somewhat stalked
12102 Lower lvs ov pointed taper unequally and sharply serr smooth those of the stem lanc tapering at each end serr nearly sess Clusters axill stalked leafy the length of the leaves
12103 Stem zig-zag roundish smooth, Lvs lanc pointed serrated smooth nearly sess Clust axill erect
12104 Stem somew zig-zag angular smooth, Lvs ovate pointed strongly serrated smooth · tapering into a winged footstalk, Clusters axillary erect
12105 Stem slightly zig-zag smooth angul branch Lvs ov.-lanc pointed densely serrated rather hairy beneath tapering into a wing footstalk upper ones ent Clust axill. erect the upper ones much long. than the lvs.
12106 Stem smooth round erect, Lvs lanc serr glabrous, Racemes axill subglobose erect, Rays long
12107 Cauline leaves lanc · the lower ones ellipt Racemes panicled erect crowded
12108 Stem quite simple downy, Lvs cuneiform lanc downy, Racemes erect, Rays long
12109 Stem a little villous, Lvs sessile lanc smooth ciliated lower serrated at end, Rays long numerous
12110 Stem quite simple pilose, Lvs lanc acute serrated smooth, Raceme term simple erect, Rays long
12111 Stem simple erect smooth, Lvs lanc serrated smooth tapering and elongated at the base, Clusters erect
12112 Stem hairy round, Lvs lanc rather hairy beneath, Clusters erect, Rays elongated
12113 Lvs. ov.-obl. rough like the corymbose stem with minute rigid hairs the lowermost serrat., upper entire, [Clusters compact, Rays twice the length of the obtuse calyx

12114 Pedunc. branched, Lvs reniform narrowed somewhat lobed downy, Petioles auricled at end
12115 Pedunc. branched, Lvs cordate 5-lobed toothed woolly, Petioles with appendages, Ray 3-flowered

12116 Heads corymbose, Lvs cordate somewhat angular downy beneath, Petioles auricled at base



and Miscellaneous Particulars

ing, and to relieve spasmodic pains in the chest of a milder kind. The leaves are also used in some parts of the United States as an agreeable substitute for tea. (*Bigelow*)

History, Use, Propagation, Culture,

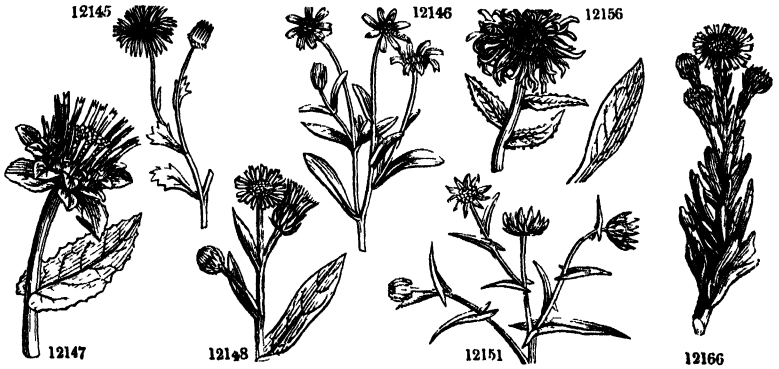
often the upper surface of the leaves C discolor, populifolia, &c are popular half shrubby plants, well calculated for bearing the confined air of a sitting room Most of the hardy herbaceous species are fine ornamental plants of easy culture C lanata and amelloides flower the greater part of the year; the former species is considered the handsomest of the genus, its petals exteriorly are of a most vivid purple, interiorly they are white.

1342. *Calotis* The name has been derived from καλὸς, beautiful, and ους ωτος, an ear, in allusion to the two membranous ear-shaped paleæ of the pappus A pretty little New Holland herbaceous plant.

1743. *Kaulfussia* Named after Dr George Frederick Kaulfuss, professor of botany at Halle, a distinguished living Cryptogamic botanist A small plant with bright blue flowers.

1744. *Inula.* The derivation of this word is uncertain. The Latins applied it to a plant which was eaten as

12117 Lvs. cordate angular downy beneath, Corymbs terminal panicled, Scales of involucre recurved at end
12118 Heads corymbose, Lvs cordate angular toothed purple beneath, Petioles winged auricled at base
12119 Pedunc about 1-headed, Branches corymb. Lvs. cord angular toothed downy beneath, Petioles winged
12120 Heads corymbose, Lvs cordate subangular downy beneath, Petioles with many appendages at end
12121 Heads subcorymbose, Lvs roundish many-lobed smooth, Petioles auricled at base, Involucre calyculate
12122 Heads cymose, Lvs cordate angular downy beneath, Petioles simple
12123 Leaves large round lobed downy and green on each side
12124 Heads corymbose, Leaves oblong lanc acuminate toothletted smooth white beneath
12125 Lvs cord subangular smooth above downy beneath, Petioles with an appendage at top, Heads corymb.
12126 Stem simple, Heads panicled, Lvs smooth tooth. . lower deltoid stalked upper obl lanc amplexicaul.
12127 Panicles axillary, Lvs alternate stalked broad lanc serrated smooth above hoary beneath [above
12128 Heads corymb Involucre hoary pubesc Lvs obl pinnatif at base segm somew toothed shining and smooth
12129 Raceme simple, Lvs reniform toothletted, Petiole inflat Stem simple leafy, Bractes in the midd of stalk
12130 Raceme simple, Lvs cordate blunt toothletted smooth, Stem simple 1-leaved
12131 Heads corymb Lvs cauline ov acute finely serrated downy beneath petioles winged at base, radic. cord.
12132 Raceme simple, Lvs spatulate cordate entire smooth, Stem simple
12133 Heads corymbose, Lvs broad lanc tooth-sinuated, Stem villous
12134 Heads umbellate, Stem simple, Lvs downy radical ovate subcrenulate, cauline lanc entire



12135 Heads in corymbose umbels, Stem simple, Lvs somewhat toothed radic spatulate, caul obl. lanc
12136 Panicle few-headed, Stem simple, Lvs all stalked cordate doubly toothed, Petioles toothed at base
12137 Heads corymbose, Lvs pinnated term pinnæ large cordate cut-toothed, lateral cuneate toothed at end
12138 Heads panicled, Involucre downy, Lvs pinnatifid segments blunt about 3-lobed downy beneath
12139 Heads panicled, Lvs pinnatifid subvillous segments sinuated, Stem herbaceous
12140 Pedunc 1-headed axillary, Lvs linear subulate glabrous, Stem shrubby
12141 Pedunc 1-headed, Lvs reniform somewhat angular, Petioles auricled at end or naked
12142 Pedunc 1-headed, Lvs pinnatifid lobed acute viscid fleshy
12143 Pedunc. 1-headed, Lvs cordate roundish with 7 angles woolly beneath
12144 Pedunc. 1-headed, Lvs opposite ovate naked

12145 Leaves cuneate cut-toothed at end

12146 The only species

12147 Lvs amplexic somewhat toothed ovate rugged downy beneath, Scales of the involucre downy
12148 Leaves amplexic oblong entire hirsute, Stem pilose corymbose
12149 Leaves amplexic lanc serrated at base pilose beneath, Stem corymbose villous
12150 Leaves amplexic cordate lanceolate wavy
12151 Leaves amplexic cordate lanc quite smooth serrated, Stem corymbose smooth, Pedunc 1-headed filiform
12152 Leaves oval rigid sessile serrulate scabrous netted, Scales of involucre ovate reflexed
12153 Leaves sessile reflexed at base lanc serrated, Stem downy clammy, Peduncles axillary leafy
12154 Leaves sessile lanc-lin Stem pilose branched, Branches spreading 1-headed, Root tuberous

12155 Leaves lanc recurved serrate scabrous, Branches angular, Lower heads tallest
12156 Lvs sess obl obsoletely serrated serratures glandular, Stem hairy 1-headed, Scales of involucre lanc villous
12157 Lvs sess obl with cartilaginous teeth scabrous rigid, Stem corymbose, Scales of involucre blunt squarrose
12158 Lvs sessile lanc bluntly serrated rigid pilose, Stem villous 1-headed, Scales of involucre lanceolate
12159 Leaves ellipt narrowed at base stalked pilose lower toothed, Stem many-flowered
12160 Leaves sessile oblong lanc serrated downy beneath, Heads stalked about 4 in terminal umbels
12161 Leaves lanc acute serrulate hairy, Lvs of involucre lanc hairy outer reflexed
12162 Leaves amplexicaul toothed very hairy radical ovate, cauline lanceolate
12163 Leaves sessile oblong lanc attenuated at base obtuse entire mucronate with a gland, Pedunc filif. viscid
12164 Leaves sessile obl acute entire scabrous, Stem branched at top, Heads corymbose
12165 Leaves sessile lin. acuminate nerved smooth scattered, Stem about 1-headed
12166 Leaves linear fleshy generally 3-pointed
12167 Leaves subserrate downy beneath radical stalked ovate, Stem erect 1 flowered
12168 Leaves lanc hirsute entire, Stem 1-headed, Involucre short imbricated

and Miscellaneous Particulars.

a preserve with sugar Inuleæ in many respects resemble Anthemideæ, Senecioneæ, and Nassauvieæ, especially in their style, but they are perfectly well characterised by the peculiarities of their ovarium, pappus, stamens, and corolla They are also related to Carlineæ They are found in every part of the world, and especially in southern Africa; almost all the Compositæ of the southern latitudes being referable to them

I Helenium, called Elecampane, from the officinal name Enula campana, is one of the largest of British herbaceous plants It was formerly esteemed a tonic, and is still retained in the Materia Medica, though little used Bruised and macerated in wine, with balls of ashes and whortle berries, it dyes a blue color. The young branches of I Crithmifolia are frequently sold in the London markets for samphire, to which they bear some resemblance in appearance, but none in virtues.

History, Use, Propagation, Culture.

1745 *Pulicaria* So named in allusion to its property of driving away fleas, *pulices* See Conyza P dysenterica has its specific name from having cured certain Russian soldiers of the bloody flux It is called by our old authors middle flea-bane, and was supposed by its smoke in burning to chase away fleas and other insects Forskahl says, it is named in Arabic *Rasa ejub*, or *Job's tears*, from a notion that Job used a decoction of this herb to cure his ulcers Of course it was formerly recommended to cure the itch. P. vulgaris is also said to drive away fleas and gnats

1746. *Grindelia* A handsome genus of herbaceous plants, with neat foliage, and pretty yellow flowers They are sometimes called Donia

1747. *Podolepis.* From πους, a foot, and λεπις, a scale The stalks of the flowers are covered with scales

1748. *Chætanthera.* From χαιτα, hair, and ανθηρα, an anther, the anther being furnished with a hairy tuft

1749. *Arnica.* This is said to be a corruption of *ptarmica*, derived from πταιρω, to sneeze The Arnica montana is a powerful sternutatory, in the Vosges it is even called *tabac* on that account The whole plant has important medicinal properties, it is fortifying, diuretic, emmenagogue, vulnerary, antiseptic, resolvative, and sternutatory. The root powdered is employed in diarrhœa, dysentery, and quartan fevers, it is also applied outwardly to bad ulcers, and in cases of gangrene. The flour is used in asthenia, rheumatic pains,

12169 Leaves ovate-oblong decurrent toothed entire at end, Flowers corymbose clustered
12170 Leaves sessile opp linear lanc entire dotted beneath, Pedunc long 1-headed
12171 Leaves lanceolate linear entire, Corymbs branched, Rays of flowers very short

12172 Leaves amplexicaul oblong wavy villous, Stem erect panicled, Pedunc. 1-fl. opposite the leaves
12173 Leaves oblong sessile, Pedunc. filiform, Involucre cylindrical
12174 Leaves oblongo-cordate amplexic. rugged downy, Stem woolly panicled, Scales of involucre setaceous

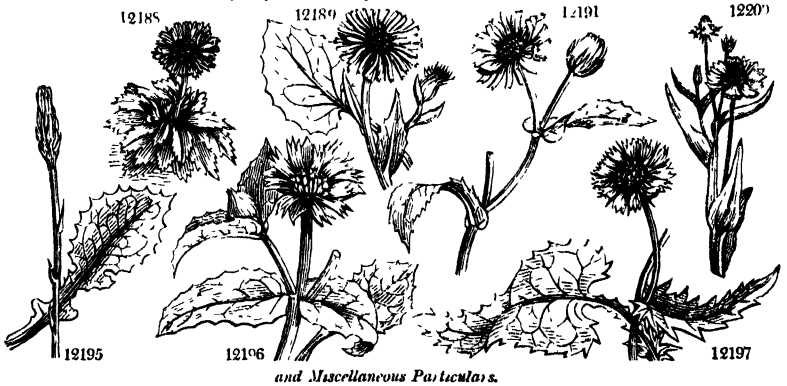
12175 Leaves ovate-obl serrated, Involucres viscid
12176 Leaves sessile obl lanceolate acute serrated at end not viscid
12177 Leaves obl amplexicaul serrated, Scales of involucre filiform at end revolute squarrose
12178 Stems simple, Lower leaves spatulate upper linear-oblong serrated 1-nerved
12179 Leaves oblong blunt half-amplexicaul. ciliate serrated, Leaves of involucre linear flat bristle-pointed

12180 Scales of involucre rugose blunt, Stem quite simple
12181 Scales of involucre equal ovate acuminate, Stem nearly simple

12182 Leaves lanceolate ciliated

12183 Leaves ovate entire cauline twin opposite
12184 Leaves toothed, Teeth acuminate radical stalked elliptical roundish, cauline alternate oblong
12185 Leaves remotely toothed hirsute radical stalked obl narrowed at base, caul alternate obl lanceolate
12186 Scape 1-headed naked, Leaves stalked obovate repand
12187 Leaves somewhat toothed and hairy radical stalked obl rounded at base, caul altern obl lanceolate

12188 Leaves obovate crenate smooth, Scape 1-headed



12189 Leaves cordate repando-dentate radical ones petiolate, cauline ones amplexicaul
12190 Leaves remotely toothletted upper oblong amplexicaul, lower ovate stalked, Petioles winged auricled
12191 Leaves toothletted upper lanc amplexicaul, lower spatulate ovate, radical cordate stalked
12192 Leaves toothed obov amplexic radical obov spatulate narrowed into the stalk, Stem simple 1-headed
12193 Smooth, Radical leaves cordate deeply toothed, cauline oblong amplexicaul Stem about 1-headed
12194 Downy, Lower leaves stalked ovate with winged petioles upper amplexicaul, all toothed

12195 Leaves stalked or ovate toothed subsinuate at base downy beneath. the old ones quite smooth

12196 The only species

12197 The only species

12198 Leaves serrated quite smooth
12199 Leaves serrated downy
12200 Lower leaves pinnatifid upper entire smooth, Florets of disk 4-toothed
12201 Leaves lanceolate decurrent, Ray of corolla 4-parted

and Miscellaneous Particulars.

bruises, gutta serena, and paralysis of the bladder The root is given in doses of six to twelve grains, the flowers of from three to four grains Dr Thomson observes, that in the hands of British practitioners it has not merited the eulogium of the French and German (*Lond Disp.* p 169)

1750 *Gerbera.* T Gerber, a German naturalist, is only known as a traveller in Russia A very pretty little greenhouse plant with neat purple flowers

1751. *Doronicum* Derived from the Arabic name *Doronigi. Pardaliauches* is from παρδος, a tiger, and αγχω, to strangle, on account of the use said formerly to have been made of the plant for the purpose of destroying wild animals

1752 *Perdicium.* A name given by Pliny to a plant of which the partridge, *perdrix*, is very fond. The plant is not now recognized

1753 *Tetragonotheca.* From τετρα, four, γωνια, an angle, and θηκη, a capsule, in allusion to the four angles of the grains.

1754. *Ximenesia.* Named by the Abbé Cavanilles, after Joseph Ximenez, a Spanish apothecary, who is said to have attended to plants

1755 *Helenium* Named after the celebrated Helen, who is said to have availed herself of the cosmetic properties of the plant named after her That is believed to be the modern Inula Helenium, the ancient name being unoccupied, it has been applied to this American genus, which resembles the other

History, Use, Propagation, Culture,

1756 *Bellis* So called from *bellus*, pretty Every one knows the daisy.

1757. *Bellium.* See Bellis, from which this genus differs chiefly in the pappus of the grains

1758 *Dahlia* Named after Andrew Dahl, a Swedish botanist, and pupil of Linnæus Continental botanists call the genus Georgina This genus grows in Mexico, in sandy meadows, and till the peace of 1814 was more cultivated in France than in England · at present it is one of the most fashionable hardy plants Though its leaves are coarse, resembling those of the common dwarf elder, yet the flowers are showy, and continue in beauty till late in autumn The plants grow freely in any soil or situation; but the poorer the ground is, the smaller the size of the plant, and the earlier and more abundant the flowers The single-flowered varieties of D superflua are almost without end, the double varieties of both species are much less numerous. Any number of the former may be raised from seeds, which ripen in abundance, and if sown in February on artificial heat, and transplanted in the end of April, they will flower in the July or August following The double varieties are increased by dividing the roots, or by grafting, or by cuttings, they may also be sometimes raised from seeds A very general way in which both kinds are propagated is by cuttings They may be either taken from the root-shoots in spring, or the tops of the young shoots early in summer, the lower end of each cutting should be cut smoothly off in the middle of a joint, and all the leaves left on, excepting those that would be buried in planting the cutting If planted in sandy soil, on a gentle bottom heat, and covered with a hand-glass, they will soon strike root, and produce both flowers and tubers the same autumn. The double sorts are grafted on tubers of the single varieties much in the manner of whip-grafting, but without a tongue. There must be no buds on the tuber; cut off a slice from the upper part of it, in a sloping direction, and make, at the bottom of the part so cut, a ledge, whereon to rest the graft, next, cut the scion sloping to fit, it should contain two joints, and be cut so that one of these may be at the bottom of it to rest on the ledge, from that joint the scion will occasionally put forth roots, from the other the future stem will be formed. Having tied the graft, clay it as in common grafting; then put the root in fine mould, burying half the graft, and place the pot in a gentle moist heat under a glass If this be done in March, the plant may he shifted into a larger pot in April, and planted out in the end of May

As the Dahlia is a bulky plant, it requires either to be grown in a very large pot, or in from three quarters to a yard and a half of surface. They look well in rows, or occurring singly in a shrubbery

The treatment of the Dahlia bears a considerable resemblance to that of the potato and the marvel of Peru; as soon as the frost has blackened the tops of these three plants, their roots require to be taken up, and

12202 Scape naked single-headed, Leaves obovate crenate

*12203 Scape naked single-headed, Leaves obovate crenate 3-nerved
12204 Stem somewhat leafy

12205 Stolones creeping, Scapes 1-headed, Leaves spatulate

12219 Leaves altern. pinnate linear setaceous

12220 Leaves linear amplexicaul ciliated at base attenuated at end
12221 Leaves linear sessile acute ciliated at base

12222 Stem filiform branched, Leaves woolly subulate filiform, Peduncles naked axillary 1-headed

and Miscellaneous Particulars.

kept in a dry place, where the frost cannot get at them till spring. About April they may be divided and planted in the open air where they are to flower, or, what is more common planted in large pots, and forwarded in heat till the middle of May, when they may be turned out of the pots where they are finally to remain. In this case they will flower a month or six weeks earlier than by the other method, and will, in general, continue flowering till they are destroyed by frost Some care is requisite to preserve the roots sufficiently moist and plump to maintain the living principle, and yet not to rot, shrivel, or freeze them. The safest mode is to plant them in pots or boxes of dry earth, and place them in a shed or cellar, or under an ample covering of litter thatched over

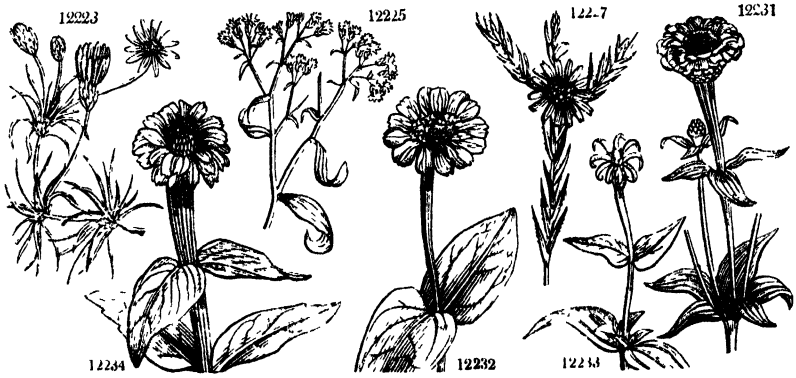
1759 *Bæbera* Bœber is said by Willdenow to have been a learned Russian botanist

1760 *Tagetes* Named after Tages, a Tuscan divinity, the son of Genius, and the grandson of Jupiter T. patula is a tender annual, deservedly popular, from the brilliancy and variegation of its flowers · it is cultivated in Japan, China, and many parts of India, but does not appear to be indigenous of those countries. The varieties of T. erecta differ chiefly in the shades of the same color, but there are also double and quilled flowers Both species are raised from seeds, upon a moderate hot-bed, in the beginning of April, and when they are three inches high, transplanted to where they are finally to remain The varieties are very apt to degenerate, and can only be reproduced by the most careful selection and separation

This genus serves for the basis of M Cassini's Tagetineæ, which do not appear to be at all distinct from Helianthee, from which they differ principally in the form of their ovarium M Cassini's principal motive for distinguishing them as a separate race, seems to have been his wish to reduce his tribe of Helianthee, which he finds too extensive. Nearly all the species are found in America.

1761. *Heterospermum.* From *ἑτερος*, various, and *σπερμα*, seed; on account of the variable shape of the grains

1762. *Schkuhrea.* Named in honour of Christian Schkuhr, an acute German botanist, who has published some of the most accurate and useful, if not splendid, botanical works which the world has seen It is to be regretted that their rarity makes them more generally unknown than they deserve to be.



1763 *Pectis.* From *pecten*, a comb, to which the teeth of the pappus may be compared.

1764. *Longchampsia.* So named after Doctor J L. A. Loiseleur Deslongchamps, a French botanist, author of a useful Flora Gallica, in two small duodecimo volumes, published at Paris, the first in 1806, the second in 1807.

History, Use, Propagation, Culture,

1765 *Leysera.* So called in honor of Frederick William Leyser, a German, and author of a Flora Halensis in 1783

1766. *Selloa.* Named after Mr Sello, a German botanist, employed by the Prussian government in collecting materials for a natural history of Brazil An uninteresting stove perennial plant, remarkable for having florets mixed among the leaves of the involucrum

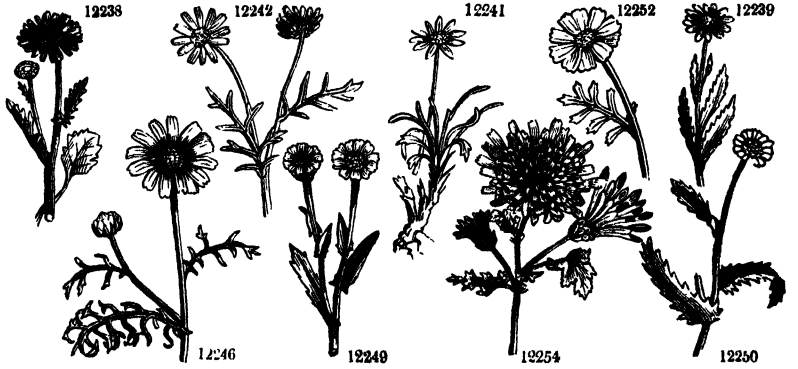
1767. *Relhania.* In honor of the Rev Richard Relhan, an English botanist, and author of a Flora Cantabrigiensis. The genus was named by L'Heritier Plants of no beauty and easy culture.

1768 *Zinnia* John Godfrey Zinn, a German, published, in 1757, a Catalogue of the Plants in the Garden of Gottingen, &c Handsome border annuals, with persistent flowers, of the same culture as Tagetes

1769 *Chrysanthemum* From χρυσος, gold, and ανθος, a flower; because many of the kinds bear flowers of a yellow color *Chrysanthème*, Fr, *Goldblume*, Ger., and *Crisanitro*, Ital. C. sinense is one of the handsomest of autumnal flowers, and of the easiest possible culture in any soil It is a popular flower in China, whence all our numerous varieties have very recently been obtained, and chiefly through the exertions of the Horticultural Society These are certainly a very great addition to the beauties of the flower garden in a dry autumn, and to the green-house or conservatory in the wet and foggy months of November and December, when scarcely any thing else is in flower The plants are propagated by divisions, by suckers, and by cuttings.

12223 Leaves linear subulate ciliate rough, Scales of involucre lanceolate
12224 Leaves filiform downy, Scales of involucre membranous reflexed

12225 The only species



12226 Leaves oblong acuminate nerveless recurved at end
12227 Leaves linear somewhat pungent striated beneath, Heads sessile
12228 Leaves linear villous, Pedunc. lateral shorter than leaf

12229 Heads sessile, Leaves opp cordate-lanceolate amplexicaul. sessile
12230 Heads stalked, Leaves opp ovate-lanceolate somewhat stalked
12231 Heads stalked, Leaves whorled ovate-lanceolate stalked, Ray double
12232 Heads stalked, Leaves opp cordate ovate sessile amplexicaul. Stem hairy, Paleæ serrated
12233 Heads stalked, Leaves opp cordate lanceolate stalked, Ray linear-lanceolate reflexed
12234 Leaves cordate sessile rough at edge, Grains of disk with 2 awns of the ray awnless

12235 Leaves smooth attenuated at base pinnatifid . segments cut
12236 Leaves all cuneiform oblong finely serrated, Stem simple 1-headed erect
12237 Leaves sessile lower linear lanceolate serrated , upper spatulate
12238 Leaves amplexic obl obt. cut pinnatifid at base , radical ones obovate petiolate, Stem erect branched
12239 Lower leaves stalked spatulate serrate upper lin lanc serrated, Stem 1-headed
12240 Leaves pinnated · pinnæ linear acute, Stem erect 1-headed
12241 Leaves linear nearly entire, Stem quite simple
12242 Lower leaves palmated : leaflets linear pinnatifid
12243 Leaves bipinnate : pinnæ oblong serrated, Heads corymbose
12244 Leaves bipinnate hoary : leaflets acute entire, Stem 1-headed simple
12245 Radical leaves 3-parted cut-toothed : cauline cuneiform 3-parted blunt
12246 Leaves bipinnated fleshy smooth, Scales of involucre keeled
12247 Leaves bipinnated linear subulate smooth, Stem erect somewhat branched
12248 Very near C leucanthemum, but the lower leaves are more spatulate
12249 Leaves amplexic glaucous incise-serrate above toothed at the base
12250 Leaves lingulate blunt serrated, Scales of involucre equal
12251 Leaves bipinnate serrated, Rays length of disk, Stem procumbent
12252 Leaves bipinnatifid acute broadest externally, Stem branched
12253 Leaves flaccid stalked pinnatifid finely toothed upper entire, Ray a little longer than flower
12254 Leaves coriaceous stalked sinuate-pinnatifid toothed glaucous, Ray very long

and Miscellaneous Particulars.

as they are very apt, in every case, to throw up suckers, the latter mode is decidedly the best. The cuttings may be taken from the side branches at any season from April to September, taken off before the end of May, they will flower the succeeding autumn; those taken off afterwards will not flower till next year. Chrysanthemums are so very prolific in suckers, that they soon become unsightly plants, and produce small and degenerate blossoms, unless frequently renewed from cuttings. The Chinese are said to do this every year, they take off the cuttings in May, strike them as we do, and then put each plant in a very small pot, in which it flowers the succeeding autumn The plants are thus kept in a dwarf state, and clothed with green foliage from the ground to the flower. In order that the blossoms may be strong, they leave only one or two flower-buds on the summit of each plant, and they remove all suckers and side shoots till the blossom is over This mode is now generally adopted with us; but sometimes the plants are retained a second, or even a third year, in which case care is requisite to leave no more stems, and to have no more suckers growing at one time than the roots can support in a vigorous state. As under this management the stems attain a great height, they require to be supported by a rod, and adjusted so as to form a symmetrical figure by a nice application of black threads, or small copper wires.

Sometimes the Chrysanthemum is grown in beds or borders, in which case the plants should be taken up every year, and their superfluous suckers removed; or, which is better, they should be totally renewed by cuttings.

History, Use, Propagation, Culture,

Though these plants will grow in any soil, yet when in small pots they require a rich loam, and are the better for being watered, as in China, with liquid manure The different varieties are well described by Mr. Sabine, in the fourth and fifth volumes of the Horticultural Transactions

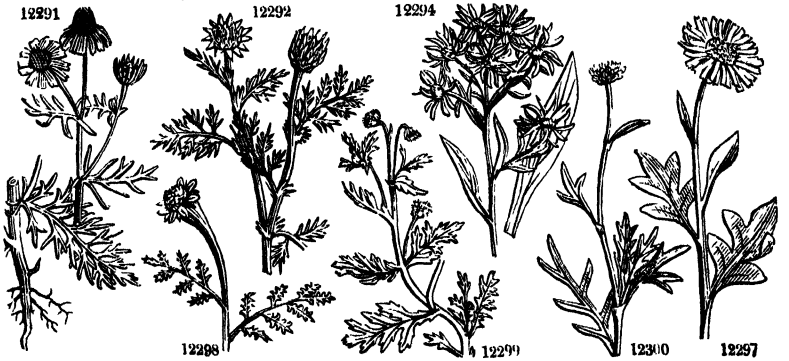
1770 *Pyrethrum* An ancient Greek name, applied to this plant from its supposed resemblance to the πυρεθρον of Dioscorides That plant is believed to have been the Anthemis pyrethrum, or Pellitory of Spain, of the moderns, and to have received its name from the burning qualities of its root; πυρ, fire. All the plant of Pyrethrum Parthenium has a strong unpleasant smell, and a bitter taste It is used externally, in the form of lotion and of poultice, and internally as an infusion for colic, hysterical affections, and weak digestion There are some double-flowering varieties, which are very ornamental.

1771. *Matricaria.* So named on account of the use which is made of it in disorders of females. *Matricaire*, Fr., *Mutterkraut*, Ger., and *Matricara*, Ital It excites menstruation Chamomilla is an alteration of the

12255 Leaves all cuneiform oblong bluntly serrated, Stem branched diffuse
12256 Leaves stalked serrated · lower roundish, upper ovate, Stem 1-headed
12257 Leaves with very narrow segments, Petioles very short connate

12258 Leaves pinnatifid fleshy · segments linear entire, Pedunc long corymbose
12259 Leaves trifid fleshy, segments somewhat toothed linear blunt, Pedunc. long subcorymbose
12260 Leaves bipinnatifid linear acute, Pedunc 1-headed terminal
12261 Leaves lanceolate serrated · radical oblong, Stem 1-headed
12262 Cauline leaves lanceolate deeply toothed radical pinnatifid, Stem 1-headed
12263 Leaves pinnatifid segments of the lower linear lanc. entire or bifid, upper linear entire
12264 Leaves fleshy pinnatifid linear toothed upper linear trifid
12265 Leaves pinnatifid segments lanc. somewhat 3-toothed fleshy, Pappus unequally toothed
12266 Leaves pinnatifid segm lanc deeply toothed somewhat fleshy upper lin. toothed, Pappus uneq toothed
12267 Leaves downy glaucous subsessile lyrate pinnatifid unequally toothed, Heads corymbose
12268 Leave pinnate powdery, Leaflets pinnatifid blunt toothed, Pedunc corymbose, Pappus toothed
12269 Leaves woolly bipinnate, Pinnæ and pinnules obl imbricated, Stem 1-headed, Involucre woolly
12270 Leaves bipinnate · pinnæ lin -filiform 2 or 3-parted, Stem erect branched, Pappus 2-lobed
12271 Leaves pinnatifid, segm lanc finely serrated, Grains subulate, Pappus unequally toothed
12272 Leaves linear serrulate, Heads corymbose
12273 Leaves lanc, lower serrated at end, upper entire, Branches corymbose
12274 Leaves lanc all deeply serrated, Stem erect branched at end
12275 Lower leaves pinnatifid toothed upper linear entire, Stem 1-headed
12276 Leaves ovate obl serrated radical stalked, cauline sessile auricled at base, Heads corymbose
12277 Leaves hairy subsessile pinnatifid toothed blunt, Corymb terminal compound
12278 Leaves pinnated smooth: pinnæ once or twice pinnatifid with acute diverging segments, Involucre smooth

12279 Leaves bipinnate linear silky · pinnæ crossing, Pedunc. corymbose, Ray shorter than involucre
12280 Leaves pinnated, Pinnæ lanc pinnatifid finely serrated upper confluent, Pedunc corymbose
12281 Lvs petiol flat bipinnate the segm ovate cut, Pedunc branch. corymb Stem erect, Involucre hemispherical [pubescent
12282 Leaves pinn · pinnæ obl obt pinnatifid toothed, upper confluent, Stem virgate, Heads corymbose
12283 Leaves bipinnate leaflets linear subulate, Stem 1-headed
12284 Rad leaves bipinnate pinnæ linear pinnatifid, cauline bipinnatifid, Heads corymbose
12285 Leaves sess bipinnatifid with segm capillary, Stem branched spreading, Pappus entire
12286 Leaves bipinnatifid the segm linear fleshy awnless, Stem diffuse branched, Pappus lobed
12287 Leaves bipinnate linear blunt, Stem ascending somewhat corymbose, Ray length of involucre
12288 Leaves hoary bipinnate linear blunt, Stem simple, Pedunc twin, Ray shorter than disk
12289 Leaves pinnatifid, pinnæ cut-toothed, Pedunc. long nearly naked 1-headed, Scales of involucre blunt



12290 Leaves triply pinnate. Scales of involucre acute
12291 Leaves glabrous bipinnatifid the segments capillary, Involucre nearly plane: its scales obtuse
12292 Leaves glabrous bipinnatifid stem branched suffruticose
12293 Leaves pinn somewhat fleshy, Pinnæ linear blunt, Scales of involucre blunt, Grains margined on one side

12294 Leaves all entire
12295 Lower leaves serrated

12296 Leaves pinnatifid glaucous beneath
12297 Leaves stalked 5-lobed

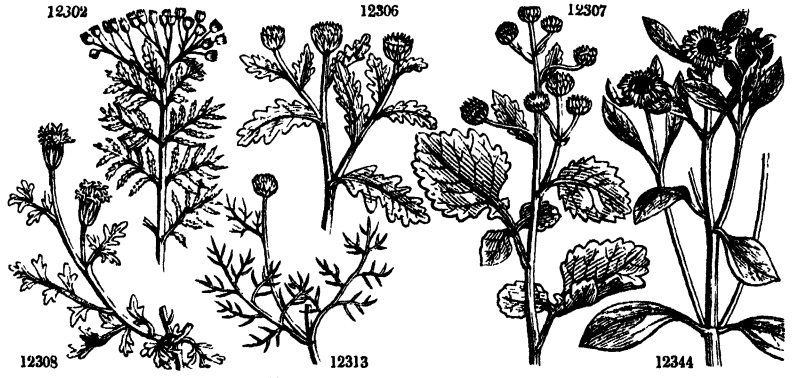
12298 Ray short white red on the lower surface

12299 Leaves pinnate multifid dilated, Ray none
12300 Leaves lanc lin amplexicaul. pinnatifid toothed, Stem procumbent, Branches 1-headed

and Miscellaneous Particulars

Greek χαμαι μηλον, a dwarf-apple, which Pliny informs us was applied to the plant, on account of its smelling of apples, or rather quinces It is remarkable, that the Spaniards call it *manzanilla*, which also means a little apple The chamomile of medicine is another plant. See Anthemis.

M Chamomilla is supposed to possess the same qualities with the officinal chamomile (Anthemis nobilis), but in an inferior degree. Most of the species, and chiefly this one, are rejected by quadrupeds.



1772 *Boltonia.* Named after I B. Bolton, an English botanist, who wrote a work upon the Ferns of Great Britain, and another upon the fungi growing about Halifax, published in 1788-9

1773 *Lidbeckia.* E. G Lidbeck, a German botanist, published some works upon agricultural matters.

1774 *Cenia* From κενος, empty, in allusion to its inflated calyx.

1775 *Cotula.* A diminutive of Cota, an old name for some species of Anthemis, which this resembles in immature.

History, Use, Propagation, Culture,

1776 *Grangea* A genus of Adanson's The meaning of the word is unknown

1777 *Anacyclus* An abridgement of *Ananthocyclus*, which was the name originally proposed by Vaillant, and which does not appear to have been altered for the better He formed it from α, privative, ανθος, a flower, and κυκλος, a circle, on account of the rows of ovaries without flowers, which are placed in a circle round the disk

1778. *Anthemis* From ανθος, a flower, on account of the multitude of flowers with which the plants are covered. A. nobilis is in considerable repute, both in the popular and scientific Materia Medica The flowers, which are the parts used, have a strong and fragrant smell, and a bitter aromatic taste, both are extracted by water and alcohol. The active principles appear to be bitter extractive, resin, and essential oil Medicinally, the flowers are considered tonic, carminative, and slightly anodyne: yet when a strong infusion of them is taken in a tepid state, it proves powerfully emetic Given in substance, united with opium and astringents, if the bowels be easily affected, they have been successfully used for the cure of intermittents, and the infusion, in combination with ginger, or other aromatics, and the alkalies, is an excellent stomachic in dyspepsia, chlorosis, gout, flatulent cholic, and chronic debility of the intestinal canal. The tepid strong infusion is a ready emetic, and is often employed to promote the operation of other emetics By coction in water, the essential oil is

12301 Leaves lyrate pinnated, Flowers radiant
12302 Leaves tripinnate: segment acute, Stem erect, Heads flosculose corymbose
12303 Stem hirsute, Leaves lyrate pinnatifid hairy, Heads terminal hemispherical

12304 Leaves cuneiform smooth 3-toothed stalked, Heads axill sessile
12305 Leaves obl cuneate repand-toothed stalked, Heads axill. sessile
12306 Leaves obl sinuate toothed downy, Stem branched procumbent, Pedunc. 1-headed opp. the leaves
12307 Leaves obovate toothed cut at base stalked, Peduncles branched

12308 Leaves bipinnate, Leaflets oblong, Stem procumbent
12309 Leaves bipinnate, Leaflets linear subulate flat, Stem ascending, Peduncle naked terminal
12310 Leaves bipinnate roundish hoary with excavated dots
12311 Leaves decompound linear segm divided roundish acute, Heads flosculose
12312 Leaves 3-pinnate, Pinn linear-subulate downy, Stem branched divaricating, Pedunc. thick

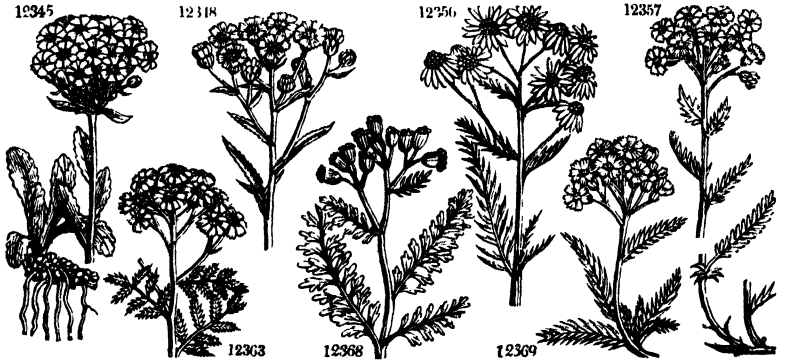
12313 Leaves bipinnate linear, Pedunc. inflated, Grains winged

12314 Leaves bipinnatifid: segm. somewhat toothed rigid, Paleæ oblong acuminate
12315 Leaves bipinnatifid segm lin subulate toothed, Paleæ round pungent dilated at base
12316 Leaves bipinnatifid segm lanc somewhat toothed, lower teeth reflexed, Paleæ lanc cuspidate
12317 Leaves bipinnatifid dotted beneath segm lanc entire, Grains naked, Stem herbaceous
12318 Snow-white, Leaves pinnate pinnæ 3 or 5-fid, Involl downy, Stem erect
12319 Leaves bipinnate pinnæ linear, Stem erect and involl downy, Inner scales sphacelate at end
12320 Leaves sessile pinnatifid segments toothed, Stem erect branched
12321 Leaves pinnate pinnæ linear entire subpubescent, Floral leaves simple, Branches 1-headed
12322 Rad leaves bipinnatifid toothed cauline pinnatifid somewhat toothed
12323 Leaves bipinnatifid stalked segm trifid oblong acute, Petioles sheathing, Sheaths toothed
12324 Lvs bipinn the segm lin subul. a little downy, Scales of receipt membranous scarcely long, than the disk [entire pappus
12325 Lvs bipinnatif their segments lin lanc pubesc Receipt conical its scales lanc Pericarps crowned with an
12326 Receipt conical paleæ obl mucronate, Grains naked, Leaves bipinnate woolly
12327 Leaves bipinnatif glabrous their segm subul Receptacle conical its scales setaceous, Pappus O
12328 Receipt subconical, Paleæ obl blunt, Grains naked, Lvs bipinnate linear filiform 3-parted
12329 Leaves pinnated downy pinnæ linear trifid bluntish, Stem ascending, Pedunc long naked downy
12330 Leaves 3-pinnate leaflets linear, Stem decumbent, Branches axillary 1-headed
12331 Leaves hairy bipinnatifid segments trifid linc linear, Stem nearly erect divided
12332 Leaves bipinnatifid serrated downy beneath, Stem erect branched subcorymbose
12333 Leaves bipinnate serrated smooth, Stem erect branched, Pappus membranous toothed cut on one side
12334 Leaves pinnated pinnæ linear 3-parted, Stem proliferous, Heads solitary axillary sessile
12335 Leaves smooth pinnatifid lobes cuneate trifid or cut, Heads solitary
12336 Leaves bipinnatifid dotted beneath segments entire, Crown of grains toothed
12337 Leaves woolly bipinnate pinnæ lanc. acute, Flowering branches corymbose, Receipt conical
12338 Leaves stalked silky bipinnate segm linear acute, Involl downy, Rays ovate
12339 Leaves linear sessile pinnatifid segm entire, Stem erect branched
12340 Leaves sessile pinnatifid segm linear subulate pectinate entire, Stem downy 1 headed
12341 Leaves pinnated pinnæ linear entire blunt, Stem downy 1-headed [edge
12342 Leaves pinnated revolute at edge segm lin. subul subtrifid, Upper scales of involl blunt with a membran

12343 The only species, resembling a Calendula

12344 Stem procumbent, Leaves ovate entire

and Miscellaneous Particulars.



dissipated: chamomile flowers, therefore, ought never to be ordered in decoctions. Externally, they are used as fomentations in cholic, intestinal inflammation, and to phagedenic ulcers and their infusion is also found to be an useful addition to emollient anodyne glysters in flatulent cholic, and in irritations of the rectum producing tenesmus. (*London Disp* p 158) There is a double variety generally grown for the apothecaries, it is more ornamental than the single, but much less efficacious as a medicine

A cotula is said by Linnæus to be a very grateful plant to toads, to drive away fleas, and to annoy bees. It is a very common weed on soft rich soils and dunghills, and increases by seeds with amazing rapidity The tribe of Anthemideæ, of which this genus is the example, are nearly related to Helianthee In their style they resemble Inuleæ, Senecioneæ, and Nassauvieæ, but their floral organs are different. They inhabit Europe, Asia, and Africa, scarcely one has been found in America, or the southern parts of the world

1779 *Centrospermum* From *κεντρον*, a spur, and *σπερμα*, a seed, in allusion to the spiny points of the pappus A small annual plant with the aspect of Calendula

1780 *Sanvitalia* Named by Lamarck without any explanation. A hardy annual plant, with flowers having a yellow ray and dark purple disk, like some species of Rudbeckia.

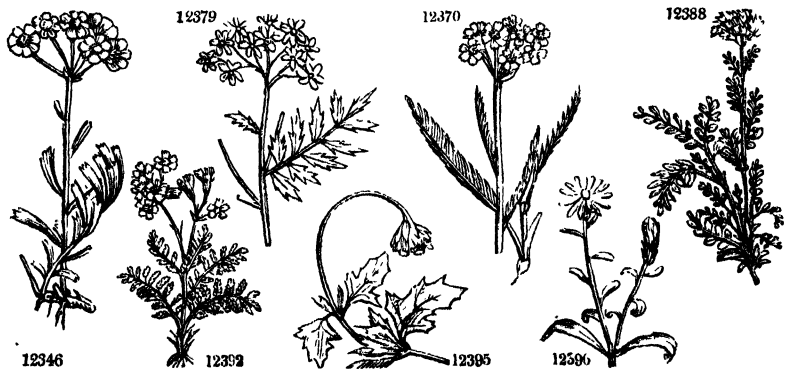
History, Use, Propagation, Culture,

1781. *Achillea* Named after Achilles, a disciple of Chiron, and the first physician who used it in healing wounds. A Ptarmica is called sneeze-wort, because the dried powder of the leaves snuffed up the nostrils provokes sneezing. In the spring, the young tender shoots were formerly put into salads, to correct the coldness of other herbs There is a variety with double flowers, which is very ornamental, especially in pots A moschata, the *Genipi* of the Swiss, is an excellent sudorific, aromatic, and acrid, and is a grateful food to cattle

12345 Leaves obl. linear blunt doubly serrulated downy ciliated, Stem villous
12346 Leaves linear narrowed at base serrated and stem smooth [at end
12347 Leaves lin acute equally and finely serrulate smooth, Stem panicled, Corymbs few-headed, Paleæ bifid
12348 Leaves linear lanc. acuminate sharply serrated

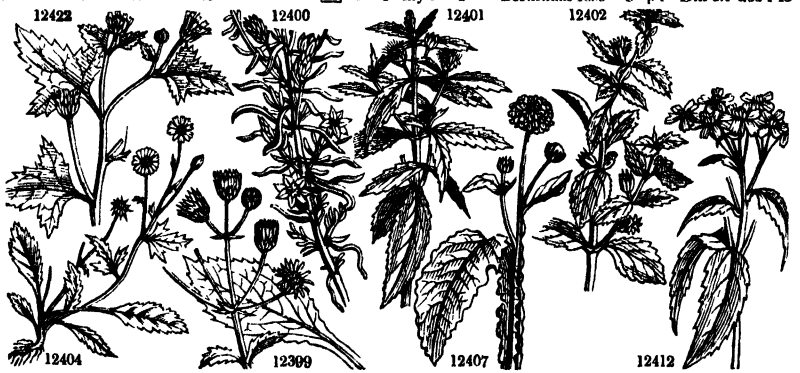


12349 Leaves lin plane acuminate toothed teeth emarginate transversely ciliated, Stem diffuse
12350 Leaves obl blunt serrated narrowed into the petiole fascicled glabrous, Corymb compound contracted
12351 Leaves linear acuminate equally and finely serrated smooth : serratures of the base deepest, Paleæ entire
12352 Leaves lanc. equally and finely serrated downy, Serratures of base deepest, Stem panicled, Paleæ entire
12353 Leaves linear pectinate pinnatifid glabrous : segm subserrated, Corymb compound
12354 Leaves downy linear lanc pinnatifid segments deepest at base
12355 Leaves downy pinnatifid smooth segm linear blunt upper toothed at end, Corymb simple
12356 Leaves pectinate pinnatifid smooth . segm linear acute, lower 2-parted, Corymb simple
12357 Leaves pectinate pinnatifid segm linear subulate entire, Corymb compound contracted, Stem downy

12358 Leaves pinnatifid : segm obl cuneate unequally toothed vertically bent, Corymbs simple
12359 Leaves pinnated roundish pilose : pinnæ 3-parted toothed imbricated across, Corymbs simple
12360 Leaves pinnat somew downy, Pinnæ 3 part blunt entire transversely imbr Ray scarcely long than invol
12361 Leaves pinnated somewhat downy, Pinnæ 3-parted transverse distant segm 3-toothed, Stem branched
12362 Leaves pinnated downy : pinnæ linear entire blunt, lowest longest, Cymes simple
12363 Leaves pectinate pinnate smooth pinnæ linear acuminate usually 3-parted
12364 Leaves linear-lanc acuminate unequally and finely biserrate villous beneath
12365 Leaves downy pinnatifid segm lanc serrated, Corymb compound
12366 Stem downy, Leaves pinnated minutely cut acute rigid bent upwards with a downy nerve
12367 Leaves pinnated . pinnæ long distant very narrow linear entire, Corymb compact branched
12368 Cauline lvs pinnatifid with entire segm radic pinnatifid with 3-fid segm Ray scarcely larger than invol.
12369 Leaves pectinate pinnate smooth, Pinnæ linear bluntish entire dotted
12370 Leaves pinn villous pinnæ toothed linear, radical bipinnate, Stem quite simple
12371 Leaves pinn downy pinnæ roundish 4-fid concave spreading, Stem branched at end
12372 Leaves pinn downy · pinnæ roundish bluntly toothed, Corymb compound
12373 Leaves pinn smooth · pinnæ lanc cut-serrated, outer confluent, Corymb compound
12374 Leaves bipinnate downy pinnæ linear-lanc toothed, Corymb simple, Peduncles long
12375 Leaves bipinnatifid hoary · segm lin lanc serrated, Corymb compound globose, Flowers flosculous
12376 Leaves bipinnatif. setaceous villous segm lanc entire, Corymb compound contracted, Flowers flosculous
12377 Leaves bipinnatifid pubescent segm linear lanc unequal acute, Corymb compound
12378 Leaves downy . cauline bipinnatifid with linear blunt segm , radical bipinnate, Corymbs compound
12379 Leaves bipinnatifid segm lanc serrated, Corymb compound spreading
12380 Leaves bipinnatifid . segm lanc cut-serrated, Rachis winged cut-serrated, Corymbs fastigiate compound
12381 Leaves bipinnatifid villous . segm. lanc blunt, Corymbs fastigiate compound
12382 Leaves thrice pinnatifid segm lanc acute, Corymbs compound fastigiate
12383 Leaves bipinnate slightly hairy their segm linear toothed acute, Stems furrowed

12384 Leaves pinnatifid downy beneath segm toothed, Stem branched fastigiate smooth
12385 Leaves bipinnatifid downy segm lanc entire, Corymb compound
12386 Leaves bipinnatifid woolly the segm crowded linear acute, Corymbs repeatedly compound
12387 Leaves subbipinnatifid pinnæ of the base undivided segm lin lanc Corymb compound, Invol cylindr
12388 Leaves bipinnatifid shorter than the intervals between them segm lin entire, Corymbs comp fastigiate
12389 Leaves bipinnatifid : segm lin finely serrated, Rachis winged entire, Corymb compound fastigiate
12390 Cauline leaves bipinnatifid · segm lin somew toothed, Rachis winged toothed radical thrice pinnatifid
12391 Leaves bipinnate downy · pinnæ pinnatifid, Segments linear-subulate, Corymbs compound fastigiate
12392 Leaves bipinnate pilose beneath . pinnæ linear entire, Corymb simple
12393 Leaves bipinnate leaflets linear setaceous mucronate very compact pilose, Corymbs compound fastigiate
12394 Leaves bipinnate downy . pinnulæ very fine linear entire distant, Corymbs compound fastigiate

12395 The only species



12396 Leaves hoary linear lanc opposite those of the branches alternate
12397 Very villous, Leaves sessile oblong acuminate entire, Heads axillary on short stalks
12398 Hoary, Lvs bipinnatifid cut-toothed, Segm linear rigid mucronate, Heads lateral and terminal clustered

and Miscellaneous Particulars.

1782 *Tridax.* From τριδαξος, cut into three pieces The rays of the flower are divided in three
1788. *Amellus* A name used by Virgil for a beautiful flower growing on the banks of the river *Mella* The plant of Virgil is supposed to have been Aster Amellus

History, Use, Propagation, Culture,

1784 *Starkea* Named by Willdenow, after the Rev. Mr Starke, of Gros Tchirna, in Silesia, who paid much attention to the Cryptogamous plants of that country This genus was included by Linnæus in Amellus, from which Willdenow remarks that it differs in habit, and in its hairy receptacle

1785 *Columellia* So called by Jacquin, after the celebrated Geoponic writer, Lucius Junius Moderatus Columella, a Spaniard born forty-two years before Christ. A plant resembling Amellus annua. The flowers are yellow and sessile in the dichotomies of the branches. The Columellia of Loureiro is a different thing.

1786. *Eclipta* A translation of the Malay name *Wangi-wangi-maihg*, which signifies an eclipse of the sun, to which the form and disposition of the radiated flower has been likened. Worthless weeds with white flowers.

1787 *Meyera.* Named after Gottlieb-Andrew Meyer, a German, who published, in 1694, a dissertation upon the Sycomorus of Scripture

1788. *Chrysanthellum* A diminutive of Chrysanthemum, which see.

1789. *Siegesbeckia* Dr John George Siegesbeck, a German physician, director of the garden at St. Petersburgh, published in 1736, a catalogue of it under the title of Flora of St. Petersburgh. There was also a Botanosophia from his pen in 1737

12399 Leaves opp. 3-nerved downy beneath, Heads in umbels

12400 The only species

12401 Stem erect strigose, Leaves oblong lanc. sessile remotely serrated
12402 Stem prostrate strigose, Leaves obl lanc. somewhat stalked subserrate somewhat wavy scabrous

12403 Stem erect, Leaves amplexicaul ovate toothed

12404 Leaves alternate 3-parted toothed: radical oblong serrated, Stem creeping

12405 Leaves stalked ov unequally toothed subtriangular at base somewhat cut, Outer involl. longer than inner
12406 Leaves sessile ovate toothed, Florets of disk 3-toothed triandrous

12407 Leaves alternate decurrent wavy blunt
12408 Leaves alternate lanc. subserate, Corymb compound
12409 Leaves alternate deeply pinnatifid, Stem shrubby
12410 Leaves opposite ovate lanc serrated acuminate at each end decurrent
12411 Stem winged, Lvs. lanc acuminate somewhat stalked serrated, Heads corymbose, Cor of ray lanceolate

12412 Leaves opposite ovate-lanc serrated downy beneath
12413 Leaves opposite cordate lanc amplexicaul remotely serrated, Involl simple 5-leaved
12414 Leaves opposite obl lanc bluntish strigose serrated at end, Pedunc 1-headed long, Involl simple
12415 Leaves opposite ov acuminate serrated 3-nerved hairy, Pedunc winged 1-headed, Involl simple
12416 Leaves opposite ov acuminate serrated 3-nerved scabrous on each side, Pedunc 1-headed axillary

12417 Leaves opposite ov serrated 3-nerved, Heads axillary subsessile, Involl simple, Stem trichotomous

12418 Leaves ovate 3-nerved serrated
12419 Leaves oblong lanceolate toothed 3-nerved lower hastate 3-lobed

12420 Stem procumbent downy, Lvs ovate entire, Pedunc lateral, Ray shorter than disk

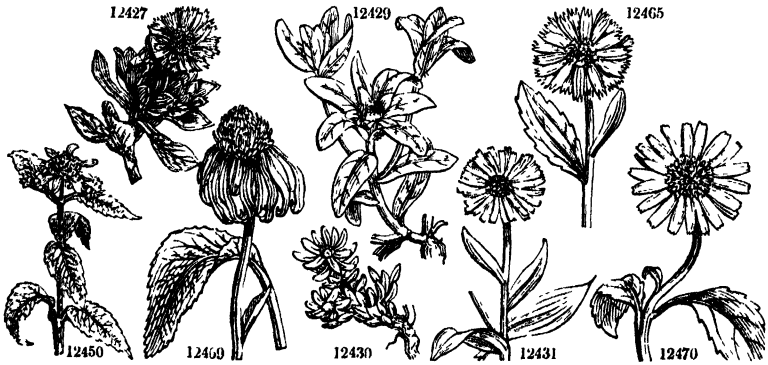
12421 Leaves ovate serrated 3-nerved downy beneath, Ray many-flowered

12422 Leaves ternate 3-lobed lower opposite, Stem suffrutescent

12423 The only species

12424 Leaves opposite ovate serrated 3-nerved, Involl. leafy, Stem herbaceous

12425 Leaves opposite obovate hoary, Petioles with 2 teeth
12426 Leaves opposite lanceolate narrowed at base not toothed smooth



and Miscellaneous Particulars.

1790. *Verbesina* A name with the same meaning as Verbena, which see. The V. alata resembles Vervain in the appearance of its foliage
1791 *Synedrella* A name of unknown meaning. A little worthless weed
1792. *Galinsogea* Named after after Mar Ma Galinsoga, first physician to the queen of Spain, and intendant of the garden of Madrid One of the species, G trilobata, is sometimes cultivated as a hardy annual But it does not possess much merit.
1793. *Acmella* From ακμη, a point, on account of the pricking taste of the foliage.
1794 *Zaluzania.* Apparently an alteration of Zaluzianskia, a name applied in error to Marsilea trifolia, and formed in honor of an obscure Polish botanist.
1795 *Pascalia.* A genus dedicated by Ortega to Didan Pascal, doctor of medicine, and a professor at Parma.
1796. *Heliopsis.* A name with the same meaning, and a genus with the same habit, as Helianthus, which see.
1797. *Buphthalmum.* From βους, an ox, and οφθαλμος, an eye, in allusion to the broad open disk of the flowers It is believed that the Buphthalmum of Pliny is a species of Anthemis.

History, Use, Propagation, Culture,

1798 *Helianthus* From ἥλιος, the sun, and ἄνθος, a flower Nothing can be a more complete ideal representative of the sun, than the gigantic sun-flower, with its golden rays, it is dedicated with great propriety to the sun which it never ceases to adore while the earth is illuminated by his light When he sinks into the west, the flowers of Helianthus are turned towards him, and when he rises in the east, the flowers are again ready to be cherished by the first influence of his beams.

H. annuus is a well known border annual, which will grow in any soil There are varieties with double flowers, the tubular florets being changed into ligular ones, like those in the ray. The whole plant, and particularly the flower, exudes a thin pellucid odorous resin, resembling venice turpentine. From the seeds an edible oil has been expressed, and they are also excellent food for domestic poultry The flowers turning with the sun, is by some considered a popular error, Gerarde says he never could observe it, and Professor Martin has seen four flowers on the same stem pointing to the four cardinal points H. tuberosus, *Topinambour*, Fr, *Erdapfel*, Ger., and *Girasole*, Ital, is called Jerusalem, from the corruption of the Italian word *Girasole*, and Artichoke, from the resemblance in flavor which the tubers have to the bottoms of artichokes These tubers are in considerable esteem on the continent as a substitute for potatoes, and before the introduction of that vegetable, they were a good deal in use in this country. Their culture and treatment is the same as for that vegetable H. multiflorus a showy autumnal flower

12427 Leaves opposite close spatulate oblong silky, Scales of involucre setaceous hirsute
12428 Leaves alternate obl lanc. amplexicaul entire hirsute, Involucre leafy mucronate
12429 Involucre bluntly leafy sessile axillary, Leaves oblong blunt alternate nearly entire, Stem dichotomous
12430 Involucre bluntly leafy stalked, Lvs alternate spatulate, Stem herbaceous
12431 Leaves alternate obl.-lanc subserrated 3-nerved villous, Involucre naked, Stem herbaceous
12432 Leaves alternate lanc. somewhat toothletted smooth, Involucre naked, Stem herbaceous
12433 Leaves alternate: lower stalked cordate doubly serrated. upper sess. ovate serrated, Stems herbaceous

FRUSTRANEA.

12434 Leaves all cordate 3-nerved, Peduncle thick, Heads cernuous
12435 Leaves all cordate 3-nerved, Peduncle evensized, Involucre leafy
12436 Leaves cordate cuneate at base villous 3-nerved, Peduncle thick fistular
12437 Leaves ovate acuminate narrowed at base unequally serrate scabrous, Peduncle filiform, Rays obovate
12438 Leaves 3-nerved scabrous: lower cordate, upper ovate, Ray many-flowered Scales of involucre lanceolate

12439 Leaves 3-nerved scabrous: lower cordate-ovate, upper ovate acuminate alternate, Petioles ciliated at base
12440 Stems slender about 1-headed, Leaves linear revolute at edge rough
12441 Leaves ovate acuminate 3-nerved serrated scabrous above hoary beneath, Involucre squarrose
12442 Leaves ovate acuminate 3-nerved closely serrated scabrous above hoary and soft beneath
12443 Lvs ovate acuminate remotely serrat 3-nerved scabr Scales of involucre lanceolate nearly equal subciliated, Rays 10 or 12
12444 Lvs lanceolate acuminate scabr serrated 3-nerved upper entire, Scales of involucre lanceolate ciliated, Stem procumbent
12445 Lvs ovate acuminate serrated 3-nerved scabrous beneath, Scales of involucre linear lanceolate ciliated at base
12446 Lvs. altern. lanc. serr. scabr 3-nerved narrow at end stalked, Petioles ciliated, Scales of involucre lanceolate ciliated.
12447 Lvs. altern. lanc serr scabr obsol 3-nerv narrow at each end subsessile ciliated at base, Scales of involucre lanceolate ciliated
12448 Smooth, Stem panicled, Branches few-flowered at top, Lvs sessile very long entire lower serrated
12449 Stem hispid spreading, Leaves ovate rigid scabrous, Peduncles very long 1-flowered
12450 Leaves altern. or opp sessile linear revolute at edge entire 1-nerved, Heads corymbose
12451 Leaves ovate lanceolate acuminate serrated 3-nerved very rough on each side, Scales of involucre linear lanceolate ciliated
12452 Leaves altern. lanc serrated scabrous 3-nerved narrowed at each end woolly at base, Stem villous in 2 rows
12453 Leaves amplexicaul Heads on long stalks, Disk of head dark purple
12454 Stem erect hairy, Lvs stalked 3-lobed very rough, Involucre hairy, Pappus with 2 setæ
12455 Stem smooth much branched, Lvs opp sessile lanceolate ovate 3-nerved, Panicle trichotomous slender few-flowered
12456 Leaves subsessile cordate ovate 3-nerved amplexicaul closely serrated downy, Scales of involucre lanceolate villous
12457 Leaves opp spatulate crenate 3-nerved scabrous, Scales of involucre erect the length of disk

12458 Leaves oblong-lanceolate subserrate, Heads 1-3, Ray 8-flowered

[hispid
12459 Lvs all pinnat. one or other of the lower pinnæ 2-parted, the rest undivided, Pappus entire Stem furrowed
12460 Rad lvs. pinn.. leaflets sessile lanceolate toothed somewhat cut, upper confluent, Pappus entire
12461 Rad lvs pinn. leaflets ovate unequal at base about 3-lobed toothed, Pappus 4-toothed
12462 Stem upright simple few-flowered at top, Leaves pinnatifid cut. segments linear, Involucre simple 5-leaved
12463 Stem branched, Branches erect many-flowered Lvs oblong lanceolate acute serrated lower 3-lobed
12464 Leaves spatulate lower 3-lobed, upper undivided
12465 Leaves undivided spatulate ovate 3-nerved serrated hairy, Receptacle conical, Paleæ lanceolate
12466 Leaves oblong lanceolate toothletted hispid narrowed at base subcordate, Receptacle hemispherical, Paleæ lanceolate
12467 Quite smooth, Peduncles long 1-headed, Lvs ovate-lanceolate acuminate each way 3-nerved
12468 Leaves oblong lanceolate cordate amplexicaul lower serrated, Disk cylindrical conical
12469 Leaves lanceolate ovate alternate undivided, Rays blind
12470 Stem hispid, Lower leaves broad-ovate tapered at base remotely toothed very rough, Rays 3-toothed

and Miscellaneous Particulars

This genus has given rise to a most important and extensive tribe of plants, the Helianthæ, which is at once the most numerous of the various tribes of Compositæ, and on account of its strict affinity with several others, the most difficult to characterize with precision. Although it is perfectly natural, yet there is scarcely a character belonging to it which is not subject to many exceptions, and to more or less important modifications. Almost all the species of Helianthæ are natives of America, several of Asia, a few of Africa, and scarcely any of Europe They appear to be entirely unknown in the southern parts of the world.

1799 *Gymnolomia* From γυμνος, naked, and λωμα, an edge, in allusion to the nature of the margin of the grains

1800. *Rudbeckia* Named after the famous Olaus Rudbeck, professor of botany at Upsal, who died of grief in 1702, at witnessing the destruction by fire of his laborious work, called *Campi Elysii*, which was nevertheless published in 1701 and 2, by the diligence of his son He is also celebrated for having made the discovery that the Paradise of Scripture was situated somewhere in Sweden Handsome border annuals or perennials. R. purpurea is remarkable for bearing purple flowers.

History, Use, Propagation, Culture,

1801. *Galardia.* Fougeroux de Bondaroy, the nephew of Duhamel, dedicated this genus to M. Gaillard de Charentonneau, an amateur of botany

1802 *Tithonia* A fanciful name given to this plant by Desfontaines, because of the color of its flower, which resembles Yellow Morning, or Aurora, whose husband was Tithonus.

1803. *Cosmea* From κοσμος, beautiful, on account of the elegance of the foliage.

1804 *Coreopsis* From κορις, a bug, and οψις, resemblance Its seed is convex on one side, and concave on the other; it has a membranous margin, and it has two little horns at the end which gives it very much the appearance of some insect C verticillata is a handsome shrubbery plant, continuing long in flower, the florets are used in North America, to dye cloth red C tinctoria is a very handsome border annual.

1805 *Simsia* Named by Persoon, after Dr John Sims, the co-editor with Mr König, of the excellent Annals of Botany, and for many years the sole editor of the Botanical Magazine.

12471 Stem branched, Leaves lanc. Paleæ of pappus entire awned

12472 The only species

12473 Leaves pinnate and bipinnatifid, Pinnæ serrated somewhat decurrent, Ray few-flowered neuter
12474 Leaves bipinnatifid segm lanc Segm. of exterior involucre lanceolate
12475 Leaves bipinnate, Leaflets linear subulate, Scales of outer involucre ovate
12476 Leaves bipinnate, Leaflets filiform, Scales of outer involucre lanceolate

12477 Leaves bipinn. Pinnules lin lanc not broader than their rib
12478 Leaves whorled 3 or 5-pinnated. pinnæ lin 3-parted and undivided, Disk discolored
12479 Leaves whorled 3 or 5-pinnated: pinnæ lin 3-parted and undivided, Disk same color as ray
12480 Leaves ternate ovate-obl serrated, Ray same color as disk
12481 Leaves serrated radical 3-parted: cauline trifid or entire lanc linear
12482 Leaves entire radical pinnated, cauline in threes lanc. stalked
12483 Leaves entire ternate sessile
12484 Leaves subternate cuneate serrated
12485 Villous, Leaves stalked quinate and ternate leaflets ovate-lanc subpinnatifid or cut serrated
12486 Leaves serrated ovate upper ternate, Stem creeping
12487 Leaves lanceolate entire ciliated
12488 Rad leaves pinnate or bipinnate entire, Outer leaves of involucre short, Ray discolored at base
12489 Leaves entire ovate lower ternate
12490 Leaves ovate acuminate crenate toothed, Grains naked
12491 Leaves stalked lanc ovate by degrees acuminate finely serrated, Corymbs dichotomous term. and axillary
12492 Leaves obovate oblong entire downy
12493 Leaves alternate lin lanc entire smooth, Ray oblong trifid middle segm largest
12494 Stem winged, Leaves alternate scabrous roundish ovate cuneate at base 3-nerved
12495 Leaves ellipt. acuminate serrated stalked veiny decurrent lower whorled, upper alternate

12496 Leaves 3-lobed toothed roughish, Petiole naked at base
12497 Hoary, Leaves somewhat palmate 3-lobed, Petiole leafy at base amplexicaul

12498 Leaves lanc obsoletely serrated toothed at base smooth
12499 Leaves obovate toothed villous

12500 Cor of ray 4-fid nearly equal to disk, Leaves hoary with down

12501 The only species

12502 Leaves ovate smooth imbricated at the edge and rib ciliate-spiny, Spine of the end reflexed
12503 Leaves alternate obl recurved smooth ciliate-spiny, Leaves of involucre ciliated
12504 Leaves altern lanc. subulate recurved smoothish ciliat spiny decurr at base, Segm of involucre ciliate spiny

12505 Cauline leaves altern amplexicaul. ciliate spiny · radical entire unarmed, Scales of involucre entire
12506 Leaves opp obl. lanc narrowed at base spiny-toothed smooth, Scales of involucre ciliate spiny
12507 Leaves altern ovate spiny-toothed 3-nerved netted hoary villous, Scales of involucre toothed spiny villous
12508 Leaves altern. obl. cuneiform spiny-toothed villous on each side, Scales of involucre toothed spiny
12509 Leaves altern lanc pinnatifid downy beneath segm entire spiny at end, Scales of involucre 3 or 5-fid
12510 Leaves opp lanc 3-nerved spiny-toothed downy beneath, Scales of involucre spiny-toothed [toothed
12511 Leaves altern lanc. spiny-toothed downy beneath, Stem herbaceous 1-headed, Scales of involucre lanc spiny-
12512 Leaves altern lanc amplexicaul spiny-toothed ciliated smooth on each side, Heads cernuous

12513 Leaves altern lanceolate oblong fleshy
12514 Leaves opp somewhat amplexicaul ovate

and Miscellaneous Particulars.

1806. *Osmites.* From ὀσμη, perfume. One of the species gives out a strong smell of Camphor.
1807. *Encelia.* A name of Adanson's, the meaning of which is unknown. A pretty half shrubby plant, with grey soft leaves
1808 *Sclerocarpus* From σκληρος, hard, and καρπος, fruit, with reference to the bony covering of the grain
1809. *Cullumia* Named after Sir Thomas Cullum, an English baronet, and one of the earliest promoters of the principles of Linnæus in this country He is still living, at a very advanced age.
1810 *Berckheya* Named after John Lefranc de Berckhey, a Dutch botanist.
1811. *Didelta.* From δις, double, and δελτα, a Greek letter equivalent to the English D, because the receptacle resembles a double triangle.

History, Use, Propagation, Culture,

1812 *Gorteria* Named after David Gorter, a Dutchman, professor of botany at Harderwych, and afterwards physician to Elizabeth, Empress of Russia He published a Flora Belgica in 1767, and assisted Kraschenninikoff in his Flora Ingrica G Rigens is a very showy plant when the flowers are fully expanded All the species are of easy culture
